MINUTES OF EVIDENCE	1
INDEX TO EVIDENCE	426
APPENDIX A.—Index	438
Papers handed in by Witnesses	441
APPENDIX B.—Report of the Agricultural Holdings Act Committee of the Central and Associated Chambers of Agriculture together with Amendments and Additions to the same made by the Council	599
APPENDIX C.—Foreign Import Duties on Agricultural Produce, &c.	604
APPENDIX D.—Agricultural Statistics. Corn Area in the several Agricultural Divisions and Sub-Divisions and Counties in England at different Periods	614

WITNESSES EXAMINED.

Name.	Description.	Page.
1. Lander, W. H., 58th day - -	Chairman of the Joint Committee of the Shropshire County Council and the Chamber of Agriculture Committee.	1
2. Richards, Westley, 58th day -	Farming his own land at Oakham, Rutland - -	14
3. Arnold, Arthur, 61st day - -	President of the Free Land League - - -	18
4. Moulton, John Fletcher, Q.C., 61st day.	M.P. for Hackney (South Division) - - -	27
5. Rutter, Lysaght John, 62nd day -	Fellow of the Auctioneers' Institute, and junior member of the firm of Messrs. Walter and Lysaght Rutter, Land Agents, Auctioneers, and Agricultural Valuers.	30
6. Hall, W. H., 62nd day - -	Landowner in Cambridgeshire, Oxfordshire, and Buckinghamshire.	36
7. Stratton, R., 63rd day - -	Tenant-farmer of Duffryn, Newport, Monmouthshire -	46
8. Nicholas, J. H., 63rd day - -	Secretary of the Technical Instruction Committee of the Essex County Council.	56
9. Finney, Richard, 64th day - -	Chairman of the Derbyshire Dairy Farmers' Association	59
10. Osborne, Samuel, 64th day -	Member of the Derbyshire County Council, and Secretary of the Derbyshire Dairy Farmers' Association.	59
11. Brown, George, 65th day - -	Tenant-farmer at Ampthill, Bedfordshire - -	69
12. Epton, R. J., 65th day - -	Tenant-farmer at Wainfleet, Lincolnshire - -	75
13. Pears, John, 65th day - -	Tenant-farmer in Lincolnshire - - - -	84
14. Riley, Edmond, 66th day - -	Member of the Great Yorkshire Society; residing at Hessle, near Hull; member of the British Dairy Farmers' Association, and formerly member of the Council of the Chamber of Agriculture.	87
15. Duckham, Thomas, 66th day -	Formerly M.P. for Herefordshire, trustee of the Smithfield Club, and member of the Council of the Royal Agricultural Benevolent Institution.	96
16. Elliott, Thomas Henry, 67th, 69th, 72nd and 81st days.	Permanent Secretary to the Board of Agriculture -	100, 140, 191 & 318
17. Collins, Digby, 68th day - -	Landowner in Cornwall - - - - -	118
18. Olver, Richard Sobey, 68th day -	Tenant-farmer near Bodmin, Cornwall - - -	126
19. Latham, Thomas, 68th day - -	Tenant-farmer in Berkshire and Oxfordshire - -	135
20. Farrer, The Right Hon. Lord, 70th day.	- - - - - - - - -	155
21. Biddell, Herman, 73rd day -	Land Agent at Playford, near Ipswich - - -	203
22. Treadwell, John, 73rd day -	Tenant-farmer at Upper Winchenden, near Aylesbury -	215
23. Craigie, Major Patrick G., 74th day.	Director of the Intelligence Division of the Board of Agriculture.	221
24. Dodds, James Miller, 75th day -	Senior clerk in the office of the Secretary for Scotland -	238
25. Howson, John, 76th day - -	Land Agent at Blackburn, Lancashire - - -	248
26. Lawes, Sir John Bennet, Bart., 76th day.	- - - - - - - - -	255
27. Looker, John, 77th day - -	Land Agent at Wyton Manor, near Huntingdon -	264
28. Reynolds, Joseph Crescens, 78th day.	Landowner and tenant-farmer at Paxford Camden, Gloucestershire.	272
29. Adams, George, 78th day - -	Tenant-farmer at Faringdon, Berkshire - - -	284

o 85358. Wt. 11544.

Name.	Description.	Page.
30. HALL, JOHN FREDERICK, 79th and 84th days.	Landowner in Somersetshire; member of the councils of the British Dairy Farmers' Association, the English Jersey Cattle Society, and the Mid-Somerset Agricultural Association; chairman of the Wells District Technical Education Committee.	290 & 355
31. DALTON, CORNELIUS NEALE, C.B., 80th and 87th days.	A member of the Commission; one of the Assistant Secretaries of the Local Government Board.	299 & 412
32. BRETT, De RINZY J., 82nd day -	A large farmer in the Argentine Republic, in the Province of Santa Fé.	327
33. DUNSTAN, MALCOLM JAMES ROWLEY, 82nd and 85th days.	Director of Technical Education under the Nottinghamshire County Council, head of the Agricultural Department of the University College, Nottingham, and district agricultural analyst for the county of Notts and the county borough of Nottingham.	343
34. HUTCHINSON, T. H., 83rd day -	Tenant-farmer in the North Riding of Yorkshire -	347
35. WOODWARD, JOHN KENELM, 84th day	Market-gardener at Evesham - - - -	360
36. JONES, JOHN BOWEN, 84th day -	Tenant-farmer in Shropshire; member of the Council of the Royal Agricultural Society.	370
37. ANDERSON, ROBERT ANDREW, 85th day.	Organising Secretary to the Irish Agricultural Organisation Society, Limited.	383
38. ROBINSON, FREDERICK LACY, C.B., 86th day.	Deputy chairman of the Board of Inland Revenue -	396
39. THOMSON, MATTHEW CHARLES, 87th day.	A station owner in Queensland - - - -	419

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION

ON

AGRICULTURE.

At 23, Great George Street, Westminster, S.W.

Fifty-eighth Day.

Thursday, 1st November 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.

John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacy Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. W. H. Lander. — 1 Nov. 1894.

Mr. W. H. Lander called and examined.

33,250. (*Chairman.*) You are Chairman of the Joint Committee of the Shropshire County Council, and the Chamber of Agriculture Commitee, are you not?—Yes.

33,251. You are here to represent the views of the joint committee?—To present their report.

33,252. What part of the county do you live in?—I live in the central part of the county.

33,253. In what union?—Newport.

33,254. Do you hold a farm yourself there?—I do.

33,255. What size is it?—261 acres.

33,256. Do you hire it?—Yes, I do.

Depression in Shropshire.

33,257. What is the condition of that part of the county?—As compared with the other parts of the county?

33,258. No, as regards the past?—Perhaps that portion of the county in the past may not have suffered as much as some of the other parts of the county, in the depression.

33,259. Is it an arable district?—Arable and grazing; principally the rearing of sheep and feeding of cattle and sheep.

Reduction of rent.

33,260. Have the rents been reduced in the district?—They have.

33,261. How much?—They would vary somewhere about 20 per cent. probably.

33,262. That is about the average?—That would be about the average, from 15 to 20 per cent.

33,263. Is there a difference between the arable farms and the grazing farms in this respect?—The grazing farms have not been reduced so much as the arable.

33,264. What is the difference?—The difference probably would be five per cent.

33,265. May we say that the grazing farms have been reduced by 15 per cent. and the arable 20 per cent.; is that the proportion?—That will be about it.

33,266. Have the assessments to the local rates been reduced in the same proportion?—I think where the reductions have been permanent that has been so.

33,267. When you are speaking of 15 and 20 per cent. reductions, were they permanent or temporary reductions?—I am speaking of both.

33,268. Then what has been the permanent reduction of rent?—In some cases permanent reduction of rent has not been a very great deal, probably not more than 10 per cent. and a temporary reduction has been given of 5 or 10 per cent., or perhaps more in some cases.

33,269. Have those temporary reductions been frequent during the last four years or only occasional?—Frequent, very often in the shape of bones and manures of different kinds.

33,270. Instead of giving it in money they have given it in manure?—In manure.

33,271. How have you done this year?—It has been a very bad year.

33,272. In what respect?—The price of grain and the price of beef. The price of wheat is of course ruinous.

Wheat growing.

33,273. Is there much wheat grown in the district?—There is not so much being sown this term as usual, by a very great deal.

Mr. W. H. Lander. 1 Nov. 1894.

33,274. But taking the previous years has there been much wheat grown during the last few years?—Not so much as before; it has gradually grown less.

33,275. (*Mr. Channing.*) Do you know whether the area under wheat is greater or less than last year?—It would be considerably less this year than last year. I know, taking the country generally, it is more.

Land laid down to grass.

33,276. (*Chairman.*) Is the land being laid down into grass gradually?—Gradually; some of the strongest clay lands have been gradually laid down to grass. Wheat growing lands.

33,277. Some of the strongest lands have been laid down, do you say?—Yes.

33,278. Is that heavy clay?—Heavy clay. The soil of a heavy staple, what we call wheat growing land.

33,279. Has that been done to a considerable extent?—To a large extent.

33,280. And does this land do well when laid down to grass?—It depends upon the nature of the soil. Some soil will become good pasture very much sooner than others. In the case of strong clay it takes many years.

33,281. Is it laid down to permanent grass or only temporary grass?—Very often temporary grasses are allowed to lay themselves down so to speak.

33,282. What do you mean by that?—The ordinary grasses that are sown in the course, in the rotation, are very often allowed to remain and of course the natural grasses of the soil in time grow up and permanent pasture is formed.

33,283. How long do you consider it takes in that district for good permanent grass to grow?—As I just said, in some soils it takes much longer than others, but on the average soil probably 9 or 10 years, before you get into a fair turf.

33,284. Where it is laid down into temporary grass is it ploughed up again for four or five years?—That is at the option of the tenant.

33,285. What is the practice?—As a rule if the tenant is going to leave he finds it to his advantage probably to plough it up.

33,286. If he does not leave what then?—If it is a good turf he would let it remain, because it would pay better as pasture than as arable.

Reduced assessments.

33,287. Would you say that where the rents have been permanently reduced the farmers have had a reduction in the assessment?—Where they have been permanently reduced, yes; not so where they have been temporarily reduced.

33,288. You come here to represent the views of the Joint Committee; what recommendations do they make?—I should not say the views of the Joint Committee; because it is a report from the county which is taken from the answers to questions that were sent out. Of course many of the members of the Committee at any rate some of them, would not endorse all those remedies that are here suggested. You understand that this is a report taken by the county from the replies received in answer to a list of questions that were sent out and circulated all through the county. (*See* Appendix I.).

33,289. (*Sir Nigel Kingscote.*) Who sent out those questions, the Chamber of Agriculture and the County Council?—The Joint Committee of the County Council and the Chamber of Agriculture. You have all the questions on this paper (*handing in a paper*).

Report of the Committee of the Shropshire County Council.

33,290. (*Viscount Cobham.*) What are the objects of that Committee?—In the first place I may be allowed perhaps to go into the history of this Committee in answer to your question. A communication was made to this Commission from the County Council of Salop requesting the Commission to send us down an Assistant Commissioner. You replied, I think, that at present you did not see your way to do so, or at all events you did not say you would send us one. Well, then the County Council decided to form a committee of their own, and to invite the co-operation of the Chamber of Agriculture. The Chamber of Agriculture were willing to co-operate, so that the Committee of the County Council and the Chamber of Agriculture became a Joint Committee to inquire into the state of agriculture and the remedies and the causes of depression in the county of Salop, and to issue this report and forward it for the consideration of this Commission.

Mr. W. H. Lander. 1 Nov. 1894.

33,291. And for no other purpose?—That was the main purpose, and to get an expression of opinion from those concerned in the county.

33,292. How many representatives of each body were on the Committee?—The County Council had nine members and the Chamber of Agriculture three. Perhaps you will allow me to go further into the analysis of this Committee. There were four landowners; six tenant farmers; one land agent and one auctioneer and valuer.

33,293. (*Chairman.*) It would be: "For the sake of "convenience that the Committee have divided the "county into three divisions, namely: First, the "northern part of the county comprising Oswestry, "Ellesmere, Whitchurch, Wem, and Market Drayton. "Second, the South Western portion of the county, "comprising Chirbury, Ratlinghope, The Hill part of "Church Stretton, and the county west and south of "the Longmynd. Third, the central and south eastern "portion of the county comprising the remainder of the county?"—Yes.

33,294. Well then: "In the northern division, appa- "rently, dairying, pasturing, and horse-breeding seems "to be largely carried on. In the south-western divi- "sion, the rearing and breeding of sheep and Hereford "cattle, and horse breeding prevails; and in the hill "country comprised in this division, there are a "considerable number of sheep walks. In the central "and south-eastern division, it consists chiefly of "stock-feeding with turnip and barley growing, also "sheep and horse breeding. What is the proportion "of pasture and arable"?—"In the northern division "the proportion is as follows:—one-third pasture and "two-thirds arable; in the south-western division, the "proportions in the less elevated districts are about "equal; but in the hill country in this division, the "proportion is about one-eighth arable and seven- "eighths pasture. In the central and south-eastern "division, the proportions of pasture and arable are "about equal, with, perhaps, a slight preponderance "of arable."

Size of farms.

33,295. "What is the average size of the farms"?—"In the northern division the average size of the "farms is from 150 to 200 acres, the largest being "about 500 acres, and the lowest about 100 acres. In "the south-western division, the average size is from "200 to 250 acres, the largest being about 1,000 acres, "and the smallest about 120 acres. In the central and "south-eastern division, the average size is about 200 "acres, the largest being about 500 acres, and the "smallest about 80 acres. In this division, the sheep "walk farms run from 400 to 1,000 acres." That is the hilly district.

Tenure.

33,296. Are the farms generally held under tenancy, or owned by occupiers?—Generally under tenancy; of course there are a great many yeomen farmers, and we have many large estates in our county.

Small holdings.

33,297. Are there many small holdings in the county?—"The county as a whole seems to be fairly well "supplied with small holdings ranging from one to "20 acres and upwards."

33,298. What is the smallest amount of acreage on which a man can live and maintain his family?—As to the smallest amount of acreage, I should say that a man ought to have at least five acres.

33,299. Are there many cases of men holding their five acres, who appear to live wholly by the land?—As a rule they accompany it with what is termed in our county "higgling"; they keep a horse and cart which they work on this holding, and on the market day they deal in poultry and that kind of thing, and also carry passengers to market.

33,300. They combine some other business with farming?—Yes.

33,301. Are there not many men with small holdings who live wholly by the land?—Not many.

33,302. (*Mr. Lambert.*) Can a man live wholly on five acres of land?—I should think it possible; but he would do very much better if he had more. I should say probably ten acres, a man would be able to live upon that.

33,303. (*Sir Nigel Kingscote.*) And his family?—Of course the family as they grow up would work for themselves. The young family he would be able to bring up.

Mr. W. H. Lander. 1 Nov. 1894.

33,304. Did you say that a man could live and bring up a family on five acres of land?—I think I ought to qualify that answer; I think perhaps a man could not bring up a family on five acres of land; I think he ought to have 10 acres.

33,305. (*Viscount Cobham.*) You mean average land?—Yes.

33,306. (*Sir Nigel Kingscote.*) Do you think he could bring up a family on 10 acres?—I think so.

33,307 (*Chairman.*) With spade cultivation or what?—He would keep a horse, and the horse would be used for other purposes, as I told you before.

33,308. (*Sir Nigel Kingscote.*) With no horse; I mean without having any other occupation?—If he has to hire a horse to plough his ground of course that alters the question altogether, for if he has to pay for horse labour it would very soon take away all the profit.

33,309. How many acres could a man live on and bring up a family, supposing he has to hire the horse labour, and does nothing else, say, on good land?—I should give him 20 acres then.

33,310. (*Mr. Lambert.*) What would be the rental of that?—I may say I can give you a typical case in my own village. There are two or three holdings, two especially of 10 acres of land each, and these men are doing well at the present time—fairly well; it is good land; half grass and half arable. The holdings are surrounded with fruit trees of every description, from which they make, in some years, a good deal of money—their damsons, especially, and pear trees, and so on. These men keep a horse and a cart. The horse does the work, and they do a little "higgling," or take a few passengers to market besides.

Average rent.

33,311. (*Chairman.*) What is the average rent of the best farms in the district?—Throughout the county good mixed farms average from 26*s.* to 35*s.* per acre, tithe included.

33,312. By the tithe included you mean that the landlord pays the tithe and therefore the rent that the tenant pays includes the tithe?—Yes, but in the Hill Country the maximum rent of this class of farm appears to be about 20*s.* per acre.

33,313. Are those at present rents, or now reduced rents?—The present rents.

Reduction of rent.

33,314. How do these rents compare with 15 years ago?—"In the Northern Division the rents of the "farms in the dairy districts are not much lower than "they were 15 years ago, but in the other districts in "this division they are at least from 10 to 15 per cent. "lower. In the South-Western Division the reduction "appear to range from 10 to 20 per cent. In the "Central and South-Eastern Division the reduction in "a great many cases is very considerable. In the "Bridgnorth District, which seems to have suffered "most, ranging from 10 to 40 per cent."

33,315. Is that mainly an arable district, or is it grazing?—You are speaking of the Bridgnorth?

33,316. Yes?—A large proportion arable, I should say.

33,317. And there it is that the rents have been most reduced?—Exactly.

33,318. Are many tenants receiving temporary reductions, and to what extent?—"Throughout the county "a considerable number of temporary reductions of "rent, varying from 5 to 20 per cent. have been "allowed."

Farm buildings.

33,319. How are the farms equipped generally as to buildings, &c.?—"Throughout the county the replies "to this question may be summed up in the expres- "sion "Fairly well." The necessity for Dutch barns "and covered yards is, however, very generally insisted "on."

33,320. Is the land fairly well drained?—Yes, generally speaking.

Tenure.

33,321. What is the general system of tenure?—There are very few leases in the county, most of the farms being held on a yearly tenancy.

33,322. Were leases more frequent a few years ago?—They were.

33,323. Have they been gradually given up?—They have been gradually given up.

33,324. That is on account of the uncertainty of the future, I suppose?—Exactly.

33,325. How is the produce generally disposed of?—"In the rural districts cattle and sheep are sold at the "large fairs and auctions. Grain (chiefly barley) is "sold at Shrewsbury, Ludlow, Newport, Wellington, "and the other markets. Cheese is sold to travelling "dealers, and at places such as Whitchurch where "cheese fairs are held." *Mr. W. H. Lander.* 1 Nov. 1894. Marketing.

33,326. Is there much cultivation on small farms in fruit?—"In the proximity of the towns and the Black "Country, "Petite Culture" is practised to some ex- "tent, but this is not the case, speaking generally, in "the other parts of the county, where very little "attention is paid to the subject, and especially is this "so with regard to the cultivation of fruit." Fruit-farming.

33,327. How does the question of railway and canal rates and charges affect your district, and is the complaint general?—"In nearly every instance the answer "to this question consists of the complaint that the "railway and canal rates and charges are excessive, "and in many cases complaints are made of the "preferential terms granted by the railway companies "for long distances and foreign traffic. Railway and canal rates.

33,328. Is there a fair demand for farms in that district?—"From all parts of the county the reply to "this question is that there is a very good demand for "the best class of farms, but very little demand indeed "for farms of an inferior character. And in every "instance it is insisted upon that the farms shall be "well equipped with buildings, &c." Demand for farms.

33,329. Are there many farms unoccupied in the county?—"It would appear that there are very few "farms unoccupied or in owner's hands. In some "instances a land owner has a 'run out' farm on "hand, &c., on which he has to lose some years rent "in order to place it in a fair state of cultivation." Farms in hand.

33,330. I suppose in that case he keeps it in hand to get it into good condition again, so as to let it?—That is so.

33,331. And when in good condition I presume he would have no great difficulty in letting it?—He would not, if it is a good farm.

33,332. What is the condition of labour in your district?—"Throughout the county regular labourers are "fairly plentiful. Wages have increased about 2*s.* or "3*s.* per week." Wages.

33,333. Since when?—Since 1879; 15 years ago. "Complaints as to the quality of the workers and the "quantity of work done are very frequent, occasional "labourers are in many districts scarce, and of an "inferior character."

33,334. You say that wages have increased since 1879?—They have since 1879.

33,335. Had they before that fallen, as compared with 1873; can you recollect?—As compared with 1873—they would probably be stationary between 1873 and 1879.

33,336. In many parts of the country there was a very distinct rise of wages of agricultural labourers in 1873?—Ours would begin about 1879.

33,337. And they have been maintained from that time to this, at the same rate?—Yes, they have not fallen again.

33,338. Taking all things into account, what is the average rate of wages?—The average rate of wages would be, to a farm labourer, 15*s.* per week.

33,339. Is that money rate?—That is money rate.

33,340. Without counting any advantages in the harvest time?—Without counting any advantages in the harvest time. Of course he would get more in the harvest time: about double that.

33,341. Taking the year round, what is about the fair estimate of the wages of the labourer, taking into account what they get in the harvest time, and so forth?—What they get in the harvest time is of course about 3*l.* extra for the month—you have got to average that over the other 11 months.

33,342. They get that 3*l.* extra in the harvest time?—Yes.

33,343. Is there any complaint as to the difficulty of getting men?—There is a great deal of complaint in getting good men.

33,344. Are there many men out of employment in the winter, in the rural district?—At the present time, in our district, there are very few indeed out of employment. Unemployed labourers.

Mr. W. H. Lander. 1 Nov. 1894.

33,345. Is that generally the case in winter now?—Probably as the winter comes on there may be more, especially this winter, than there have been, but I may say that most of the young men in our villages drift away to the town. They go for railway porters and draymen, etc.; they seem to like the town life much better than they do the country life.

33,346. Has there been a reduction of the rural population in the county?—There has. I am not prepared with figures.

Farms that have withstood depression.

33,347. What class of farms, and what system of farming, have withstood the depression best?—"We "quote in this report one reply received to this ques- "tion as being typical of the whole, viz.:—'Hard "'working, energetic men with sufficient money to "'work the farm.' Dairy farms and graizers appear "to have done the best."

33,348. And by the hard working and energetic, you mean men who work themselves?—Men who work themselves.

33,349. Of course that is generally the case in the medium sized or small farms?—Well, that is not always so; I do not mean a man working actually in the same way as his labourers would, but a man who is up early in the morning, and at it until late at night, who is here, there, and everywhere.

33,350. Not going two or three days a week to market?—No, or one or two days a week hunting, which I do not object to—I rather like it. I am only explaining what this report means.

33,351. Some of the men on a small farm work themselves at manual labour?—Yes, at manual labour; but of course it would not pay a man with a large holding to do manual labour, because while he would be getting half-a-crown in one field, his men would be losing a good deal more for him in the next.

Condition of farms.

33,352. What is the general standard and state of farms at the present time?—"The standard of farming "appears to be moderately good, but the farms do not "seem to be in quite so good a condition as they "were a few years back, the farmers not having suffi- "ciently capital to employ adequate labour, &c."

Technical instruction.

33,353. Is advantage taken of the opportunities for technical education?—"From the replies received it "would appear that technical instruction has not been "appreciated or taken advantage of by the farmers to "any great extent." I can fully endorse that. Farmers do not believe much in technical education.

33,354. (*Viscount Cobham.*) Not the dairy classes?—The dairy classes are better attended, and have been greater successes than many of the other classes.

Game.

33,355. (*Chairman.*) Then with regard to game, complaint as to the over-preservation of game?—"The "almost unanimous reply to this question is 'No,' the "only exceptions being two from Market Drayton, and "three from Newport; but these replies do not bear "any signature."

33,356. The two exceptions are Market Drayton and Newport, in respect of game?—Yes.

33,357. So that from all the others there were no complaints?—Yes, to these replies, you see from the report, there was no signature.

33,358. And in the case of the Ground Game Act has that been allowed to have full operation?—The provisions of this Act appear to be very widely appreciated by the farmers.

33,359. (*Viscount Cobham.*) Does that mean that the farmers get a great number of rabbits from their farms?—Yes, and the hares, in many cases; if they are getting too numerous the tenants do not hesitate to shoot them.

33,360. Do you think that it has been a good thing for agriculture, the increase in the number of rabbits?—The decrease.

33,361. Have the rabbits increased or decreased?—Decreased considerably.

33,362. (*Chairman.*) And the hares too?—And the hares too. In some districts of course it is different, in all districts it is not alike.

Taxation and local rates.

33,363. What is the general opinion with regard to the incidence of taxation?—"The following are a few "replies to this question:—'That all incomes from "whatever source should be taxed.' 'That taxation "of farms under Schedule B. is oppressive.' 'That "there should be a local income tax for local rates.' "That land tax should be abolished or allocated to the "reduction of local rates.' 'That land tax is most "unjust, and is virtually a double income tax.'"

Mr. W. H. Lander. 1 Nov. 1894.

33,364. That is a tax which falls upon the landowner?—It has not been so in all cases; hitherto the tenants in some cases have paid the land tax; I may say, in my own case, up to last year I paid the land tax.

33,365. Under a special agreement with your landlord?—Yes, but now the landlord pays the land tax.

33,366. What does it amount to in your case?—On my farm the land tax was 4*l.* 13*s.* 6*d.*

33,367. What is the size of your farm?—261 acres. That is 4*d.* an acre.

33,368. Did the fact that you have paid the land tax enter into the consideration of the rent, between the landlord and yourself?—Possibly it did.

33,369. And recently he has taken to paying the land tax?—Recently, it took effect on Lady Day 1893; the landlord pays the land tax. He reduced the rent by about 5 per cent., and he pays the moiety of the fire insurance which the tenant paid on the buildings. Of course that stood on the same footing as the land tax.

33,370. Does he pay the tithes?—The landlord pays the tithes.

33,371. Was there any alteration made in the rent when the landlord took upon himself to pay the tithe?—The landlord has always paid the tithe so long as I have had anything to do with it.

33,372. Is it the opinion of the farmers that the rates should be divided between the landowner and the tenant?—On this question opinion seems to be equally divided in the county; on the one hand it was urged that the rates should be equally divided between landlord and tenant; on the other hand that the division would make no practical difference one way or the other.

33,373. They thought that it would be adjusted in the rent, I suppose?—Probably those who thought the latter would come to the conclusion that the landlord would put half of the rates on the rent so that it would make no difference.

The Agricultural Holdings Act.

33,374. Then with regard to the Agricultural Holdings Act, what is the opinion of the county?—"Public "opinion seems to be distinctly unfavourable to the "present Agricultural Holdings Act which, it is urged, "requires very considerable amendment and exten- "sion. Several farmers advocate the formation of "land courts, boards of arbitration, and fixity of "tenure."

33,375. You say several farmers; is that the majority or only a few?—Not the majority in the case of land courts. A majority would prefer to see a new Agricultural Holdings Act, the present one repealed and a fresh one in its place, with machinery extended and amended to make it simpler, and so on.

Land courts.

33,376. But without the formation of land courts and fixity of tenure?—As to land courts many farmers do not like the word, it sounds for them a little bit too Irish. They do not much like the name of "land court."

33,377. Would you say that the majority of the farmers are against the fixing of rents by judicial authority?—I believe that is so; they think that rents should be a question between landlord and tenant; that there should be freedom of contract.

33,378. You think that it is better left to agreement between landlord and tenant?—I believe that is the feeling.

33,379. (*Viscount Cobham.*) Would you say the great majority were of that view?—I should not say the great majority.

Beer.

33,380. (*Chairman.*) Is there a general desire for a pure beer bill?—An universal desire for a pure beer bill is expressed in the report.

33,381. That is to say, I presume, some legislative measure for the purpose of making it compulsory that beer should be made from nothing but barley and hops, is that it?—That is so; and that there should be stated on the barrel or in the public-house what the beer is brewed from that the customer is supplied with. If a man wants a glass of ale from malt and hops he should be able to get it. May I be allowed to state that (of course, I am giving you now the opinions in this report)

Mr. W. H. Lander.
1 Nov. 1894.

I have a resolution passed by the Salop Chamber of Agriculture on the question of pure beer and other matters connected with this, and, perhaps, you will refer to it later on.

Protection.

33,382. With regard to foreign imports, what is the general view?—The replies to this question are almost entirely in favour of the taxation of foreign imports in some form or other.

33,383. Is that your own opinion?—It is not.

33,384. Do the farmers in your district consume a considerable amount of foreign feeding stuff?—They do.

33,385. I presume they would not wish those to be taxed?—No; it has been suggested that a tax should be put on foreign barley that is used for malting purposes, but I do not know how you are going to draw the line, because a good deal of foreign barley, Russian barley, at the present time is being used for feeding purposes, and Russian barley is very cheap indeed at the present time, I bought some last week at 3*l.* 16*s.* per ton delivered, and it is of good feeding quality.

33,386. (*Sir Nigel Kingscote.*) How much is it a quarter?—It would be about 15*s.* a quarter.

33,387. (*Chairman.*) I suppose it is a great boon to farmers in the district to have this cheap barley or feeding stuff for cattle?—It is very cheap, and, of course, it is a boon as you express it, but if you put a tax on foreign imports that must be taxed too, it cuts both ways.

33,388. Should you say in the county as much corn is bought for feeding stuffs as is sold?—Taking the county throughout in the grazing district, more is bought than is sold.

33,389. And you yourself personally do not see how it is possible to draw a line between one class of corn and another?—I do not.

Bi-metallism.

33,390. Well then with regard to bi-metallism do you find in the replies that that is understood or not?—I am afraid that there is a great want of knowledge on that subject.

33,391. Were some in favour of it or not?—The few answers we received were generally in favour of it. I had better read it: "Very few replies have been received on this question, and such as were received were generally in favour of bi-metallism."

33,392. I suppose there is the idea that it would raise prices?—That is so. The general answer to the question was in many cases, "This is for experts." "Know nothing about it," and so on. And I believe that is true—there is a great want of knowledge on that subject.

Reduction of rent.

33,393. Looking generally at the replies received from the farmers, what remedies do they suggest?—The first remedy that they suggest is the reduction of rent.

33,394. They think that it has not been sufficiently reduced already?—That is so.

33,395. Do they think that the temporary reductions ought to be converted into permanent ones?—Yes, they do not get the advantages, as I have before mentioned, in the assessment unless there is permanent reduction.

33,396. I think you said that the rents throughout the county still averaged 26*s.* to 35*s.* per acre?—That is for good mixed farms.

33,397. Therefore there is a great deal of room for reduction still, if it is needed?—Yes.

33,398. Compared with other parts of the country, you consider the rents in the county to be high?—They are very much higher than many counties.

33,399. And so far as to judging of the depression by the rents the county has not suffered as compared with some other districts?—We are told so, but if we have not suffered as much as other districts in the past it is coming, and it is upon us, I may say.

33,400. You say that there is no difficulty in letting the farms?—Not in letting good farms.

33,401. At the old rents, or at the present rents?—At the present rents in many cases where the farms are in a good state and well equipped with buildings.

33,402. In that case there is no difficulty in letting farms at the existing rents?—Yes, at the existing rents.

33,403. You have already told us about the taxation of foreign imports and lowering of railway rates; and the next recommendation is with reference to the institution of light railways in the rural districts?—That is a subject which is being taken up in the county now very strongly. The County Council at our meeting last Saturday appointed a committee to inquire into the question and to report, and we were very glad to see that the Board of Trade had issued invitations for a conference on that subject, because it is generally believed that the institution of light railways—the construction of light railways—would be a great benefit to the farming interest. It would open up the rural parts of the county, and it would expedite and cheapen the transit of produce.

Mr. W. H. Lander.
1 Nov. 1894.
Light railways.

33,404. Are there many districts of the county which would be greatly benefited by light railways bringing them in connexion with the other railways?—There are.

33,405. In the county generally should you say that it was badly provided with railways?—Well, I should not say it was badly provided, but there are many districts where railways only traverse at long intervals.

33,406. You have considerable districts remote from a railway station; you mean where the light railways would be a great boon?—Yes. There is another advantage that we consider the light railways would give us, and that would be the reduction of the cost of maintenance of our main roads, because a great deal of the traffic would be taken on these railways instead of on the roads themselves.

33,407. And reduce the highway rate?—The county rates. The main roads are all mended by the County Council.

Local rates.

33,408. Have the rates increased in your district or the reverse?—The rates have increased—the county rate.

33,409. But taking the aggregate of all rates; take your own case—have they increased or not?—They have increased.

33,410. Can you give us the figures?—I think I can. To take my own parish, which I may say is a typical case of the rates, they are collected together—the poor rate, the highway rate, and the county rate, and so on. This year the rates amount to 1*s.* 6*d.* in the £. In 1893 they were 1*s.* 2*d.* in the £; in 1892 they were 1*s.* 2*d.* in the £; and in 1891 they were 1*s.* 2*d.* in the £.

33,411. (*Mr. Everett.*) Is that for the whole year or a half year?—The whole year.

33,412. (*Chairman.*) Going rather far back; can you say what it was 10 or 15 years ago?—They would fluctuate a great deal; you would find about 10 years ago probably the rates would be about the same as in 1891, that is 1*s.* 2*d.* in the £. They would go down to 1*s.* in the £, and probably up to 1*s.* 6*d.* in the £.

33,413. Then you have had the advantage in the last two or three years of a reduced assessment. I think you said that the assessments had been reduced in proportion to the rent?—Yes.

33,414. Apart from this year, when it has risen to 1*s.* 6*d.* in the £, the last three years you must have had, as compared with previous years, the advantage of the reduced assessment?—Yes, the reduced assessment is one cause of the increase in the rates, and of course another cause is that there has been a great expenditure—the county rate has increased.

33,415. Apparently there has been no increase until this very year?—Not since 1891.

33,416. And I suppose the assessments have been reduced for some few years past?—They have been gradually reduced.

33,417. And therefore apparently from what you have said, the rates have remained fairly stationary at 1*s.* 2*d.* in the £ for a great many years?—Yes.

33,418. And if the assessment has been reduced the actual payments of rates must be rather reduced?—Of course that depends; generally speaking, it would be so.

33,419. Generally speaking, it would be so where the assessment has fallen?—Yes.

33,420. This year apparently there has been an increase from 1*s.* 2*d.* to 1*s.* 6*d.* That may be an exceptional rise?—The tendency now is for them to keep on increasing I am afraid.

Mr. W. H. Lander. 1 Nov. 1894.

33,421. Your figures do not show that except this very last year?—May I give you the county rate?

33,422. I think it is better to give the aggregate rates—all the rates. I think your district does not seem to be badly treated in respect of rates as compared with many others, as it has been for many years 1*s.* 2*d.* in the £?—I may say that is not the case in all the unions. I am speaking now more especially of our own union. The next union, which is the Wellington Union, contains a mining population, and the rates are considerably higher; they would be over probably 2*s.* 4*d.* in the £ in the year.

33,423. You come there into a different industry; it is not a purely agricultural district; it is a mining district?—Mine is typical; it is purely an agricultural district.

33,424. And for many years past your rates have averaged 1*s.* 2*d.* in the £, and the assessments have been reduced?—The assessments have been reduced gradually.

33,425. But this year there has been an increase from 1*s.* 2*d.* to 1*s.* 6*d.* in the £?—Yes.

33,426. (*Viscount Cobham.*) Is that mainly due to the roads?—It is greatly due to the main roads. You see the County Council took over the main roads, and they have spent a great deal of money upon them. I may say that some of them were not in a very good state, and consequently the first outlay has been a great deal.

33,427. (*Chairman.*) That may not be permanent?—It may not be permanent.

33,428. Therefore you may hope to get back to 1*s.* 2*d.* in the £?—Yes.

33,429. (*Mr. Little.*) Have they extended the system of main roads?—They have taken the old main roads; not taken over many others.

33,430. They have taken the disturnpiked roads, but not any others?—In a few instances, but not many. We take it that it is a great mistake that the turnpike gates were ever taken away.

33,431. (*Chairman.*) Should you say from your knowledge and your experience of your own union with regard to the rates that it is the same as that of other purely rural unions?—I should think it was.

33,432. I am not taking the case of Wellington where there is a mining population, but a purely rural union?—Yes; a purely agricultural union.

33,433. You say that the rates have not averaged in the past more than 1*s.* 2*d.* in the £?—1*s.* 2*d.* or 1*s.* 4*d.*

33,434. And with a reduction in the assessments?—That is so.

33,435. Then the aggregate burden of the rates must have been less than in the past, because with a reduced assessment the smaller amount must be levied?—That must be so, if you work it out that way.

The Agricultural Holdings Act.

33,436. As to the Agricultural Holdings Act, and apart from any question of constituting a land court to make judicial rents, what changes do you think ought to be made in the Act?—I have in this paper suggested several specific amendments, the first is that of arbitrators.

33,437. (*Mr. Little.*) May we understand whether this is your individual opinion or the collective opinion of the committee?—I have been giving you the opinion received by the committee.

33,438. Now you are giving your own opinion?—Now I am giving my own opinion. What I have been giving you was mainly from the report.

33,439. (*Chairman.*) What you are now going to recommend as the alterations of the Agricultural Holdings Act, are they your own or that of the committee?—They are my own.

33,440. I think it would suffice to put this in as your own views; they are under 15 different heads?—Yes.

The Witness suggested the following specific amendments:—

"(1.) Arbitrators or referees to be appointed by the district councils for each district, such appointments to be confirmed by the Board of Agriculture with a scale of maxium fees and charges.

"(2.) Permissive clauses done away with such as occur in sections 5, 17, and 33.

Mr. W. H. Lander. 1 Nov. 1894.

"(3.) In section 1, strike out the words 'on quitting his holding,' and also the clause relating to the 'inherent capabilities of the soil,' and add after the words 'incoming tenant' the words 'at the 'same time taking into consideration the original 'outlay.'

"(4.) Increase the number of first-class improvements for which compensation is payable, and put all first-class improvements on the same footing as drainage, provided when landlords' consent is refused the appointed arbitrators are called in to determine whether such improvement is necessary, and would add to the lettable value of the holding.

"(5.) No penal rent recoverable for a larger amount than damage actually caused.

"(6.) Time of notice of claim by tenant and landlord to be the same.

"(7.) Freedom of cropping and sale of produce, provided adequate return of manure is made.

"(8.) At the commencement of a tenancy a record to be made of the state of the holding in every particular, each field, &c. to be scheduled.

"(9.) Add to Part III. of the First Schedule consumption on the holding by horses of cake,—feeding stuffs, corn, &c. Also by horses, cattle, sheep, or pigs of corn produced on the holding.

"(10.) And other additions numbered 32, 33, and 34 in Central Chamber Committee's Report.

"(11.) Compensation for vexatious or unreasonable disturbance over and above actual tenant right.

"(12.) The Board of Agriculture empowered to grant loans to landowners for carrying out agricultural improvements.

"(13.) Abolish Law of Distress for rent.

"(14.) Period in respect of which a landlord may claim for waste or breach be reduced from four years to two years.

"(15.) Landlord's counter claims shall be scheduled."

33,441. (*Mr. Clay.*) Are these opinions of yours on the Agricultural Holdings Act shared by the majority of farmers in the county?—Yes, I believe so.

33,442. (*Chairman.*) You propose on your own behalf these 15 different amendments of the Agricultural Holdings Act which you have put in?—Yes, those are my own individual opinions. May I return to the question that was put to me by Mr. Clay who asked me whether these specific amendments to the Agricultural Holdings Act were the general opinion of the farming community in the county. I think I answered that I thought they were. I believe they are generally speaking, but, of course, there are great many farmers who have their objections to certain amendments, but I think, as a rule, these amendments would be, most of them, acceptable, and I may say I have resolutions from the Chamber of Agriculture bearing upon some of these amendments which I should like to put in.

33,443. (*Mr. Channing.*) You are referring to your own suggestions in the reply?—Yes.

33,444. (*Chairman.*) Apart from the special subjects which you have already mentioned there are three or four other things recommended by the farmers generally; the first is the application of the Merchandise Marks Act to foreign produce; the second is that there should be co-operation in the sale and distribution of produce in order to bring the producer and consumer nearer together?—Yes.

Co-operation for sale of produce.

33,445. Have you any practical recommendations as to how that can be brought about?—I have. It is thought that a good deal of the profit goes to the middleman, and that the producer and the consumer are too far apart. Especially is this the case in meat—beef, mutton, and so on. We think that landowners and farmers' associations, I think I will put it, might be formed, and that all landowners and farmers be asked to join; that the capital of the association be raised as follows: landowners and tenants to pay so much per cent. of what they receive and pay as rent, to a common fund; and that the first efforts of the association be directed to obtaining for the farmer the full value of his beef, mutton, and meat of all kinds, less the slaughter and freight, and selling to the consumer. The operations contemplated would comprise the purchase, erection, renting of stores and shops in towns, with depôts in country districts, to include slaughter-houses, cooling chambers, and so on, and that the produce be dispatched to these shops in the towns and sold; to include butter, poultry, eggs, and all kinds of produce—dairy produce. Of course it is rather a large order, I must allow, and I must tell

Mr. W. H. Lander. 1 Nov. 1894.

you that it is not an original proposal on my part. I believe it emanates from a Mr. Arthur, in Devonshire, but it seemed a feasible thing.

33,446. This is rather a recommendation for the future—it has not been tried?—No.

Dairy factories.

33,447. Has there been co-operation among farmers in the county for the purpose of making butter and cheese?—No, there is one dairy factory, but only one I believe.

33,448. Has that answered, or not?—It has answered.

33,449. Has it improved the average quality?—The uniformity of the produce is much improved, and that is a great point; that is where the Danish butters and other butters supersede our own.

33,450. Could more be done in that direction?—I am decidedly of that opinion.

33,451. Is there much foreign butter sold in the towns in your district?—There is a great deal.

33,452. And is not that very much on account of the uniform quality of the butter?—That is so.

33,453. And the farmers in the district might get that market by securing greater uniformity in their products?—Yes.

33,454. Why do not they do so more?—They are not able to do it with present appliances.

33,455. Why do not they co-operate more in that way, because, apparently, it can be done by co-operation?—There is a want of capital. Where is the money to come from to build the factories?

33,456. Where did the money come from for the one factory that has been started?—The shareholders; it is a company.

33,457. Is it an independent company merely buying this milk from the farmers, or is it co-operation in the true sense of the term, namely, that the farmers themselves come together?—It is not co-operative in the true sense of the term; it is more in the shape of a private company.

33,458. Does it pay interest on its capital?—I believe it does.

33,459. Why do not more start of the same kind?—Well, farmers as a rule are rather slow to move. We think that if the means were arranged whereby the money could be found to build these factories—for instance, loans at fairly low interest—that it might be a very great advantage.

33,460. They have not realised apparently the extreme importance of getting a market for their produce by securing uniformity?—I do not think they have.

33,461. They have not appreciated the extreme importance of uniformity?—No.

33,462. (*Mr. Channing.*) Have many of them taken any active part against the combination in factories?—There has been no antagonism to it at all.

Tithe.

33,463. (*Chairman.*) Then only one other point that you have not mentioned, and that is the alteration in the Tithe Commutation Act of 1836, so that the tithe might be based on the rateable value of the land instead of on the gross produce?—It is thought, I believe, that there is a grievance in this respect as to how the tithe was levied. The light corn—the tail corn is not taken into account; the tithe only comes from the price that is made by the best corn; and therefore I believe that the persons who answered this question had that in view, and they thought that if the tithe were based on the rateable value of the land it would be perhaps better and more equitable.

33,464. What is the tithe in your district?—The tithe on my farm is 64*l.*; that is the commutation amount.

33,465. What is it now?—Now it would be worth 74*l.* and some odd shillings per cent.

33,466. Then it seems to be rather high?—Yes.

33,467. (*Mr. Little.*) What is it in proportion to the rent?—My rent is 31*s.* per acre, the present rent.

33,468. (*Chairman.*) What does the tithe amount to per acre; what is it commuted at?—64*l.* 19*s.* 10*d.*

33,469. For how many acres?—261 acres. The present value of the tithe is 74*l.*

33,470. This is a heavy tithe, 5*s.* per acre, is it not?—Yes.

33,471. As to the land tax, what is that?—That is 4*l.* 13*s.* 6*d.*

33,472. (*Viscount Cobham.*) Is there much demand for allotments?—Well, I cannot say that there is a very great demand. There is a demand, but I do not think the demand is so great as it was expected that it would be.

Mr. W. H Lander. 1 Nov. 1894. Allotments.

33,473. Does it come from the agricultural labourer or the neighbourhood of the manufacturing towns?—It comes from both—more from the agricultural labourer.

33,474. Has the demand been fairly supplied?—The agricultural labourers, you see, who work regularly upon the farms are allowed as a perquisite so much ground in the farmer's field to grow their potatoes, so that that forms a kind of allotment for them.

33,475. Is that a very common practice in Shropshire?—A very common practice in Shropshire.

33,476. Where the demand has been fairly well satisfied, has it been by the landowners or by the action of the County Council?—Where there has been a demand the landowners, I think, have supplied it. I do not think that the County Council have had to take action at all in the matter.

33,477. Do you think that allotments will operate to retain the younger labourers in the village?—There is no doubt that that would be a very important factor in keeping the youth in the villages if they had proper allotments; and I say when the Parish Councils come into operation probably we shall hear more about the allotments than we have done before.

Immigrant Scotch farmers.

33,478. Have you many Scotch or outside farmers in your district?—We have several Scotch farmers who have come into the county.

33,479. How have they done?—Well, I think they have done quite as well as the natives. They have adopted a rather different system of farming to what we have been generally accustomed to.

33,480. In what way?—They have grown a great many potatoes and produce of that kind, which in some years has paid very well.

33,481. Are they business men?—They are strictly business men and they are hard-working men generally speaking; and they are very careful men too.

33,482. (*Chairman.*) Do their families work?—In some cases they do.

33,483. (*Viscount Cobham.*) Do the Scotch farmers introduce dairy farming where it has not been the practice before?—I cannot say that they do so much as in the case of those who have come from the county bordering us, of Cheshire.

Sale of cattle by live-weight.

33,484. (*Sir Nigel Kingscote.*) Are cattle and sheep sold by weight near you at all in Shropshire?—Not as a rule; they are generally sold by auction, not weight.

33,485. Would you like weigh-bridges made compulsory?—I should. I generally sell my own cattle at home if I can possibly get a dealer to buy them, and I always weigh them before he comes, so that I can calculate what they would be worth dead.

33,486. If weigh-bridges were more universally used, and if they were made compulsory it would be an advantage?—I think it would be an advantage if they were more universally used.

Cattle disease.

33,487. Have you had any experience in your county of cattle disease?—Not lately; we have had a few cases of pleuro-pneumonia, but taking the county as a whole the cattle have been very healthy.

33,488. Do you approve of the measures taken by the Board of Agriculture to stop cattle disease?—Certainly I do.

The Agricultural Holdings Act. Scheduling the condition of farms.

33,489. (*Mr. Clay.*) Under the Agricultural Holdings Act at paragraph 8 you say that at the commencement of a tenancy a record should be made of the state of the holding in every particular, each field, &c. to be scheduled?—I do.

33,490. That would be when the tenant goes out, to show what would increase the value of his holding or diminish it?—Exactly.

33,491. And you would have that done at the end of his lease?—I would. I say that when a tenant enters a farm when a new tenancy begins, a record should be taken of the state of the farm in every particular, every field, ditch, gate, fence, and everything should be scheduled, and it should be placed upon his agreement, so that when the tenancy was determined, he should receive all above that standard and should pay for all below that standard.

Mr. W. H. Lander.
1 Nov. 1894.

33,492. It would not be a very difficult matter to reduce all those things that you have referred to?—I do not see any difficulty at all.

Reduction of rent.

33,493. What has been the general reduction in the past in the county?—"In the northern division the "rents of the farms in the dairy districts are not much "lower than they were 15 years ago, but in the other "districts in this division, they are at least from 10 to "15 per cent. lower. In the south-western division "the reduction appears to range from 10 to 20 per "cent. In the central and south-eastern division the "reduction in a great many cases is very considerable. "In the Bridgnorth district, which seems to have "suffered most, ranging from 10 to 40 per cent."

33,494. You still require a further reduction to be prosperous then?—Yes.

33,495. What is the further reduction required on an average?—I certainly think that a further reduction is inevitable. I am not prepared to say what that reduction should be, but if these present low prices of wheat and other things continue, I am afraid the reduction would have to be considerable.

Law of distress.

33,496. Regarding the law of distress you seem to go for the abolition of it?—I do.

33,497. Do you think it would be for the benefit of the farmer?—Yes, the farmer and the landlord too.

33,498. It would put him in a more independent position?—It would put him in a more independent position, and it would also restrict the competition for farms. At the present time landlords, and especially their agents, are very apt to take the highest bidder, and not inquire sufficiently into the capital the would-be tenant possesses, and other qualifications. They do it simply because they know that they are in this position; that they have 12 months priority of claim over every other creditor, and it is very often that they accept a man who is not suitable with regard to the capital that he possesses, but simply to keep up the rent on the estate—simply as an example; and to say, "Well, I have let the farm at so much money," and to the other tenants perhaps applying for a reduction the agent says: "Look here, we let this farm at so "much; therefore yours must be worth as much."

33,499. So that it puts credit buyer on the same footing as the ready-money buyer?—That is so.

Light railways.

33,500. (*Mr. Gilmour.*) You spoke of the great benefit that would spring from light railways if constructed in your county?—I did.

33,501. How would you propose that the money for the formation of these railways should be raised?—Well, I proposed that the County Council would probably be the best authority to manage them, and that they should be empowered to have loans from the State. They might have it on the security of the rates.

33,502. One of your reasons for the light railways was to reduce the rates, I think I understood you to say?—That was one of them; lessening the cost of the main roads—the maintenance of the main roads.

33,503. (*Chairman.*) By relieving them of heavy traffic?—Yes; the heavy traffic instead of going on the road would be conveyed on the railway.

33,504. (*Mr. Gilmour.*) And you think that even the money necessary to pay for those loans, supposing you did it in that way, and the keeping up the roads would not increase the county rate?—I do not think it would.

33,505. Are your roads in your county generally wide enough to be made at all useful for running light railways along?—Many of the roads in our county it has been found necessary by the county surveyor to lessen in width to save the road material. Of course some of the roads would be too narrow to put the railway on the side of it; but I may say that probably half of the main roads would be quite wide enough to admit of a light railway being put. I understand that they would be two-feet gauge, or something of that kind, and they would not take up a great deal of the road.

33,506. Have you gone into the probable cost at all of these light railways in a county such as yours?—I believe the probable cost of constructing a railway and equipping it would be 2,000*l.* a mile, or something of that kind; I do not know whether that is the correct estimate or not.

33,507. We have an estimate put before us that probably it would be double that amount per mile?—I think 2,000*l.* a mile would do it, because if the Board of Trade relaxed all the restrictions and conditions which they place now upon signalling, &c., that would much lessen the cost.

Mr. W. H. Lander.
1 Nov. 1894.

Report of the Committee of the Shropshire County Council.

33,508. (*Mr. Little*). The committee that was appointed by the County Council and the Chamber of Agriculture collected opinions—did they afterwards deliberate upon the expressions of opinion received?—They did not.

33,509. Thep simply reported?—Simply reported.

33,510. I gather from this paper, that the Committee got about 300 replies?—They sent out 300 lists of questions, but they did not get those many replies.

33,511. Do you know how many, or about how many, they got?—I believe they got—I am not quite certain of the exact number because some came in after the report was printed, but I believe they got about 100 replies.

33,512. They do not propose to consider those replies, or they have not attempted to consider them and arrive at some conclusion as a committee?—Not as a committee, that was not their province; they drew up their report from the replies.

The Agricultural Holdings Act. Substituted agreements.

33,513. Upon the question of the Agricultural Holdings Act you propose a number of amendments. You propose to do away with the permissive part of the Act altogether?—I do.

33,514. You do not approve of substituted agreements?—I do not.

33,515. On what ground would you forbid the landlord and tenant to enter into an agreement for compensation?—Because it places the tenant in a very unfair position. As the Act stands agreements appear to override the working of the Act, and many agreements have no compensation clauses in them.

33,516. If an agreement has no compensating clause the Act applies?—It may do.

33,517. It will do?—It does not always apply.

33,518. You mean that it is not always made use of?—It is not always made use of.

33,519. But the tenant has an indefeasible right?—At the present moment.

33,520. At the present moment he has an indefeasible right to compensation?—If he goes under the Act he has very great difficulty to get compensation under that Act.

33,521. But he has a right to claim under the Act if his agreement does not give him compensation?—As a rule his agreement substitutes compensation for compensation under the Act, which is a very different thing.

33,522. A substituted compensation under the agreement must be reasonable and fair?—So the Act says.

33,523. Can you explain why a tenant and landlord should not be allowed to agree? Supposing the tenant prefers a substituted compensation, a definite scale of compensation to the uncertainty of an award under the Act, why should not the tenant be allowed to make the agreement?—I prefer an Act that is compulsory, and that you should have a definite scale of compensation incorporated in that Act.

Scale of compensation.

33,524. Then you would make the compensation definite?—I would.

33,525. And not what it is under the Act?—I would. Take, for instance, the compensation for an unexhausted improvement, I may say the manures, feeding stuffs, and so on. Then I would have Sir John Lawes's Table, or something of that kind, incorporated with the Act.

33,526. Would you give a uniform scale of compensation for all descriptions of land?—I do not quite understand your question.

33,527. If you define the compensation, it must be the same for all descriptions of land, must it not?—Why should it not be so?

33,528. Would you maintain that the manurial value is the same, as lasting and as durable everywhere?—I do not see any very great difference to be taken into consideration.

33,529. You would be prepared to lay down one universal scale as applicable to the whole country?—I would as to the manurial value.

Notice of claims.

33,530. You would also do away with the freedom to the tenant to contract for a six months' notice?—Yes.

33,531. Even where he preferred a six months' notice to a 12 months' notice?—Yes, that it should be illegal if he did it.

Mr. W. H. Lander.
1 Nov. 1894.

33,532. On what ground?—Because I think, generally speaking, that 12 months' notice is quite short enough.

33,533. Have you not known cases where a 12 months' was very inconvenient—12 months' notice may be within one day of two years?—Possibly in isolated cases; but in drafting an Act of Parliament you have to consider the general benefit, and not take into consideration isolated cases.

33,534. Then you think that the general benefit is sufficient to induce the Legislature to prevent landlord and tenant contracting?—I do.

Compensation for improvements.

33,535. By your third proposal I presume you intend that compensation should be paid to the sitting tenant?—That is so, where there is any alteration in the terms.

33,536. Where his rent is reduced?—I do not know that in the case of a reduction of rent he would want to settle up. If the landlord gives him notice to quit with a view to raising on the rent, he having made the farm more lettable by his own improvements, I think before they go any further that a settlement should be made, and it should not be necessary to quit that holding to receive compensation for the tenant's improvements.

33,537. The effect of the proposal of striking out the words "on quitting his holding" is that at the termination of the tenancy from any cause the tenant must be compensated if he has made an improvement?—That is so.

33,538. How would you propose to carry that out—how would you value his improvement?—I should propose to call in this arbitrator whom I appointed at the commencement here.

33,539. And what would the landlord get in return for his expenditure if he has to compensate the tenant and the tenant retains the use of the thing for which he is compensated—how is the landlord to be indemnified?—The landlord can raise the rent if he likes.

33,540. (*Mr. Channing.*) He would charge the full market value for the land?—Yes, or the tenant can leave—he can do either he likes.

33,541. (*Mr. Little.*) The first class improvements which you wish to increase in number, are they the same as the Central Chamber has desired?—Generally speaking they are.

33,542. Is there anything that you particularly wish to mention that is in these recommendations of the Central Chamber?—I think I have the Central Chamber's recommendation here. Is the building of cottages in the Central Chamber Report?

33,543. I think not?—The laying down of permanent pasture, that is in the Report, I think.

33,544. But your proposal is to put all those improvements on the same footing as drainage?—That is so.

33,545. That the tenant can first of all give notice to the landlord that he wants them; that the landlord can then supply them, and if he does not the tenant can do it and have a claim to compensation?—That is not so; the tenant if the landlord refuses to do them or refuses consent for the tenant to do them, then it shall be that the arbitrator shall be called in to say whether this proposed improvement is necessary and whether it would add to the lettable value of the holding. Then if the arbitrator determines that it is not necessary and that it would not add to the value of the holding the tenant makes it then at his own risk. Of course he would not be able to claim any compensation for them.

33,546. But if these improvements were put on the same head as drainage, as you propose, would it not be the case that if the landlord would not do the work the tenant could do it?—I believe it would be under the Act.

33,547. You mean to make it subject to the approval of the arbitrator?—That is so.

33,548. And you would allow a tenant, with the sanction of an arbitrator, to put up buildings such as cottages and carry out other improvements against the will of the landlord?—Yes.

Penal clauses.

33,549. Then, with regard to your proposal number 5, you say that no penal rent should be recoverable for a larger amount than the damage actually caused; have you ever known a penal rent extorted?—Personally I have not suffered from that or come in contact with it, but I have heard of a great many cases.

33,550. Where it has been actually enforced?—Where it could have been enforced or where it has been held over the head of the tenant who, therefore, has given up claims which he justly could have had.

Mr. W. H. Lander.
1 Nov. 1894.

33,551. You know that of your own knowledge?—Exactly, I do. If you will allow me—I have an agreement which I should like to put in without mentioning names, although the person is dead and all concerned, but I would rather that the name in this agreement should not be made public (*handing in same*). You will see from that that there are the penal clauses.

33,552. (*Mr. Channing.*) Similar to the penal clauses in most leases as to cropping and pasture and so on?—Very similar.

33,553. (*Mr. Little.*) I do not dispute at all that such things are embodied in agreements. My question was whether they have ever been enforced or whether they have been simply threats?—They may not be often enforced, but, as I said just now, they are held over the head of the tenant and prevent him from making just claims, because they say, "If you claim so-and-so I "shall enforce my penalties, my penal clause." Therefore the tenant, of course, thinks it wiser to be quiet, and he is a great loser thereby.

33,554. Your proposition is that no damages should be recovered beyond the actual injury to the landowner?—That is so.

Freedom of cultivation.

33,555. With regard to freedom of cropping and sale of produce, would you have that given by law?—I would, subject to an adequate return of manure.

33,556. And who is to be the judge of the adequate return, the arbitrator?—The arbitrator.

32,557. To be called in at any time?—The onus of proof shall lie on the tenant whether he has supplied this manure.

33,558. Would you apply that in the case of tenants at present in possession; would you give them an absolute right to farm as they please?—I would, subject of course to certain restrictions as to the last year of the tenancy; perhaps that might be equitable, because it is very awkward for a man to take a farm with all the straw and everything sold off it, there would be a difficulty in letting the farm, and therefore perhaps during the last year of his tenancy this might be modified.

33,559. But where a tenant has hired a farm under the express condition that he shall consume a certain description of produce on the farm, you would absolve him from those conditions, the present tenant?—I would.

33,560. Even if he would have given more a year ago to have had the farm on those conditions you would still give him the liberty without his giving any additional rent?—Yes.

33,561. You would admit that in a great many cases the rent would be considerably more with complete freedom of cropping and cultivation than it would be with restrictions?—Well, it is very easy to make a re-arrangement.

33,562. But I thought it was to existing tenancies you would give this freedom?—Yes, I would.

33,563. Without charging additional rent?—Of course that would be a matter of arrangement between landlord and tenant.

33,564. But that is not an existing tenancy. An arrangement contemplates a re-letting?—Well then if the farm is re-let we must have a settling, the same as I proposed with regard to the sitting tenant.

33,565. Supposing a landlord and tenant to-day make a bargain at so much rent, the tenant being restrained as to the produce that he should grow and sell and to-morrow you say notwithstanding this agreement you shall sell and grow whatever you please and your bargain as to the rent holds good?—Yes.

33,566. Is not that giving the tenant something which was not his?—Well, if you put it in that way it might possibly be so; but if you are going to make a new Act of Parliament there are generally certain difficulties that have to be met, and I do not think that there would be any difficulty there, because I think that the landlord and tenant would be quite free to make the fresh arrangement and come to terms.

33,567. And that involves a re-opening of the question of rent?—I do not say that the question of rent should not be re-opened.

Mr. W. H. Lander.
1 Nov. 1894.

33,568. As you do not propose that it shall apply to the existing tenancies it must be either the one thing or the other?—I propose that it applies to all tenancies.

33,569. Existing tenancies?—It shall apply to all tenancies.

33,570. Shall apply to all existing tenancies?—Only the way you put it I understand is that it would not be fair to the landlord if he granted all these privileges and the tenant did not pay more rent—that is the way you put it?—Yes. It is quite open for the landlord to say, "Well now the Act of Parliament is such that it "gives you an advantage, I think, and therefore I "must have more rent." "Very well," the tenant says "all right, and if that is so we must have a settling, and I must be paid compensation for my improvements before we go any further.

33,571–2. That is creating a new tenancy?—That is so.

33,573. And should you consider that if this liberty were given to the tenant and if the landlord considered it valuable and attempted to raise his rent on that account, that that was vexatious or unreasonable disturbance for which compensation should be given?—Well, I should not consider it vexatious disturbance there, because the tenant would have the opportunity of staying.

33,574. But if he did not agree, what then?—Yes, the tenant would be paid.

33,575. For the disturbance?—He would not be paid for disturbance under that head.

Compensation for consumption of home-grown produce.

33,576. You propose that the allowance for manures should be extended so as to include the consumption by horses; would you give that for consumption by all horses—horses that go off the farm?—Horses that are kept exclusively for farm purposes?

33,577. Horses that do not leave the farm or horses that are only kept for farm work?—Would you include farm work—taking grain to market or to the station?

33,578. That is what I ask you; would you include consumption by working horses that are frequently on the road?—I should.

33,579. You would give compensation?—I cannot see how you could draw the line.

33,580. Do you think it would be fair?—I do not think it would be very unfair.

33,581. Supposing a man has a pair of horses on the road every day in the year, would not that leave a great deal of manure on the road?—I do not think that a pair of horses would be on the road every day in the year. If the farmer conducted any other business outside his ordinary farm work, and his horses were employed in that business then I should say that the case would be different.

33,582. (*Mr. Channing.*) I understood you that you accept the suggestions of the Central Chamber on that head?—I do.

33,583. You are aware that they confine the compensation to horses exclusively kept for farm purposes?—Yes.

33,584. (*Mr. Little.*) You would be satisfied to have the compensation confined to horses kept on the holding?—That is so.

33,585. You say that the landlords counterclaim shall be scheduled—do you mean scheduled in the Act of Parliament?—Yes.

33,586. The things that he may claim for?—The things that he may claim for.

Penal clauses.

33,587. (*Mr. Lambert.*) This agreement that you showed me just now, is it general in your district?—That is an extreme case; I cannot say that the penalties are often as high as in the agreement, but there are generally penal clauses in most agreements.

33,588. Are the conditions of cultivation so specially laid down and so heavily penalised if not strictly adhered to as in this agreement?—Perhaps not.

33,589. This is a rental of 40*l.* a year for 11a. 2r. 29p.; what would that land consist of?—Half turf and half arable.

33,590. Would that have been reduced since 1883 when that farm was let?—I could not say, because it has changed hands, and no doubt the rent has been considerably reduced since then, but I could not tell you what the rent was.

Mr. W. H. Lander.
1 Nov. 1894.

33,591. But such agreements as that are not common in your district?—Not to the extreme extent of that agreement; but still that is the principle on which agreements are generally drawn up as regards the penal clauses.

Reduction of rent.

33,592. Coming to the report that you have been good enough to collect you say that rents have been reduced from 10 to 15 per cent., but you do not consider that has been a reasonable reduction?—I do not.

33,593. You were not able to give Mr. Clay what you consider would be a reasonable reduction?—I do not think I could, because so much depends upon the prices of our produce; but still if you take the comparative price of wheat to-day with what it was 15 or 20 years you will see there a very considerable reduction. Then you take the price again of meat and you will find there a very great reduction.

33,594. Would meat have been reduced so very considerably?—Meat would have been reduced probably I should say 25 per cent.

33,595. Since when?—Since 1879. I have some tables here.

33,596. I do not think we require them. You consider that a reasonable reduction of rent has not been given to the farmers?—I do.

33,597. Why has it not been given?—Because it has not been in proportion to the fall in the produce which they have to sell.

33,598. Why has it not been in proportion to the produce that they have to sell?—Well, it has rested of course with the farmers themselves; they have taken the farms at those rents, but of course there is another side of the question. The farmer who is on a farm does not care to leave it—there are many reasons, sentimental and otherwise, why he does not care to leave his holding; possibly he was born there, and so long as he can hold out at all he does so.

33,599. I presume according to that, that if the farmer is giving more rent than he ought he is not able to meet his landlord on equal terms?—Certainly not.

The fixing of rent.

33,600. What do you advocate to allow him to meet his landlord on equal terms as regards fixing of rent?—As regards the fixing of rent I should place him on an equal platform with the landlord, in so much that he should be entitled to compensation for any increased value he may have added to the holding.

33,601. Yes, but that would only take place at the termination of the tenancy?—Yes.

33,602. He would have had to pay these very high rents before the termination of the tenancy, which may be five or seven years, or even longer?—I am afraid the question of rent must be a matter of supply and demand, and also that it must be a question between the landlord and tenant.

33,603. And you have no remedy to offer to enable the tenant to meet the landlord upon more equitable terms?—I know that it has been proposed that tenants should be able to take the landlord into court and have a judicial rent paid, but for my own part, I think that freedom of contract ought not to be interfered with, and I think that the question of rent ought to be a matter that the landlord and tenant themselves ought to be able to settle.

33,604. Do you mean freedom of contract as regards rent, or everything?—As regards rent.

Tenure.

33,605. You say most of your farms are held under a yearly tenancy; is not a more secure tenancy preferable to a yearly tenancy for good agriculture?—I think if you get a just and equitable Agricultural Holdings Act there need not be any fear as to the insecurity of tenancy of a holding.

33,606. Do you think it is possible to get an Agricultural Holdings Act that will give to the tenant that same security that he would enjoy if he knows that he has the farm on reasonable terms for a series of years?—I think so.

33,607. Do you think that the recommendations here would fulfil that purpose?—I do.

Railway and canal rates.

33,608. Now you say that in nearly every instance, in the answer to the question on railway rates, there is a complaint that the railway and canal rates and charges

Mr. W. H. Lander. 1 Nov. 1894.

are excessive; have you any specific instances of this?—I have no specific instances; I have not thought it necessary to bring any of those with me; but generally speaking, the complaint is that preference is given to the conveyance of foreign goods to our home produce on our railways.

33,609. But as I say that is only a general statement?—Exactly.

33,610. You have no facts to go upon to prove that statement?—I have no specific facts; I have not brought any because I did not think it necessary.

33,611. I think you could get them?—Yes, I could very easily get them.

Farmers' capital.

33,612. Are farmers short of capital now?—I am afraid they are very short.

33,613. That is that they have been paying away their capital?—They have been paying rent out of capital.

33,614. You have some replies about the over preservation of game; can you give any reason why they did not give their signatures?—They were afraid to sign their names for fear of publication, perhaps.

33,615. Is such terrorism common in Shropshire?—I did not say that terrorism is common; it is not altogether non-existent.

The marking of foreign meat.

33,616. Do you wish to state anything about the application of the Merchandise Marks Act on foreign meat, and other produce?—Yes. I should like to state this; that a feeling exists that the interests of agriculturists are being seriously injured by misrepresentation in selling foreign meat as English, and if all classes of meat could be sold with the full knowledge of the purchaser of the country of origin, meat produced in this country would be more in demand, and command a higher price; and I would advocate that every person dealing in foreign meat should register and fix a notice over his shop. I may tell you, Mr. Lambert, that I strongly approve of the Bill which bears your name.

33,617. Do you advocate it being extended to anything else besides foreign meat?—Yes, I should extend it to every article that we produce that is offered for sale.

Game.

33,618. (*Mr. Channing.*) About these replies in reference to game. Is there any impression in Shropshire, in this neighbourhood which I see is your own neighbourhood, that tenants, if they made use of the Ground Game Act freely might have notice to quit on some other ground? Evidence has been given as to that in other counties?—I would not go so far as that, because I think, generally speaking, a very good understanding exists between landlord and tenant in our county; but still there may be isolated cases in which a tenant would think it would be wiser and more judicious on his part not to allow his name to be made public in any complaint of the kind.

33,619. In these neighbourhoods which are mentioned here, is there an excessive head of game, of rabbits and hares kept?—Well, I suppose there are in one or two instances, and although, perhaps, these replies do not carry a signature, personally, I knew pretty well where they came from.

The fixing of rent.

33,620. As to Mr. Lambert's questions as to tenants being on a footing of equality with the landlord for bargaining for a fair rent, I suppose your remedies would be to this effect:—That you do not recommend a land court to assess rents between landlord and tenant, but that you rather would give the tenant greater advantages which would enable him to bargain more freely?—Exactly.

33,621. Are those advantages, and judging from your own paper, it would be really a remedy in regard to getting a fair rent, in the first place compensation to the sitting tenant; and in the second place, compensation for disturbance?—Exactly.

33,622. And in the third place, what you have advanced with regard to freedom of cultivation and prohibition of penal rents beyond the actual loss or damage sustained by the landlord?—Yes.

33,623. Do I understand that if tenants were placed in the position of having compensation without leaving, and if they were unreasonably turned out of their holdings, and there was this further limitation of penal rents, they would be in a very much better position, which you still wish to be free?—They would be placed on a more independent and equal footing with the landlord.

33,624. Those are your remedies as an alternative to anything in the nature of a land court?—They are.

33,625. Do you attribute the depression in agriculture in Shropshire, as elsewhere, mainly to the fall of prices?—Certainly, low prices are the cause of depression.

Mr. W. H. Lander. 1 Nov. 1894.

Low prices.

Farmers' capital.

33,626. And you say that the rents were, to a certain extent, paid out of capital; do you attribute the bad position of agriculture to the tenants having too little money to carry out agriculture in the best way?—There is no doubt that the tenants are seriously handicapped at the present time by being short of capital; especially is that the case on grazing farms where cattle and sheep are fed, because if the farmer has money when he goes to market, if he sees a lot of cattle or sheep, or anything else he can buy to advantage, he buys; but if he has not the money, of course he cannot, and he is farming under very great difficulty.

33,627. And yet pound per pound his capital would go further in the purchase of store cattle and feeding stuff than it did 15 or 20 years ago?—Yes.

33,628. That would show that capital is so much more?—Yes.

33,629. And you attribute that largely to over-renting?—I should not say it was altogether over-renting; of course, it is over-renting in one sense; another is the low price that he is able to get for his produce.

Compensation for improvements.

33,630. A good deal of evidence has been given here that farmers who farm highly are less able to get reasonable reduction of rent in proportion to the fall of prices, than farmers who let their farms go down?—Yes.

33,631. Is that one of your main reasons for advocating compensation to the sitting tenant?—One of my main reasons.

33,632. Will you explain a little further what you mean by compensation to a sitting tenant. Now in the case of reductions in rent, if one man has been farming very highly, and another man has been farming badly, the actual money value of the first farm is very much higher than that of the second farm, but if you get a reduction of rent in proportion to the valuation of each of those farms, you would be forcing the incoming tenant to pay on his improvements?—Yes.

33,633. Therefore it would come in the form of adequate reduction, as well as increase of rent?—Yes.

33,634. Whenever the terms of the farmer are rearranged the tenant should be able to say, "The "remaining value of my improvements should be fully "considered before those terms are decided?"—Certainly.

33,635. Whether by increasing the limitation of the rent, or by limiting the increase of the rent?—Just so.

33,636. Otherwise the tenant would have to go on paying a rent on his improvements?—Exactly.

Freedom of cultivation.

33,637. Now about freedom of cultivation. Is not it the fact that on a large number of very well managed estates, freedom of cultivation is practically now the rule?—It is a fact that a good many of the agreements which exist, and have been signed by landlords and tenants, are not now enforced, but still that is no reason why they may not be enforced if it were found necessary.

33,638. This might be used as a threat?—They might be held over the head of a tenant.

33,639. Is your main objection to this sort of penal rent, and the threat which it holds out, this: that it is contrary to the rules of agriculture?—Certainly.

33,640. What do you suppose is the motive of intelligent landlords in not enforcing contracts of this kind, and allowing their farmers to farm more freely; is not the reason mainly economical?—No doubt it is.

33,641. Were not these covenants entered into in a totally different state of farming where practically there were no other manures, and when the manurial value of straw and hay was very different from what it is now in comparison with its commercial value?—Certainly.

33,642. Therefore an economical reason for getting rid of these old covenants is advancing the freedom of cultivation, which is as much to the interest of the landlord as to the tenant?—It is as much to the interest of the landlord as to the tenant.

Competition for farms.

33,643. You speak of the competition for farms in Shropshire. Are there many farms which have got into a very poor condition in Shropshire?—I am afraid there are.

Mr. W. H. Lander.
1 Nov. 1894.

33,644. A large number?—A good many.

33,645. And those farms are farms which capable tenants who had a choice would wish to avoid?—Exactly.

33,646. Does not that fact immensely increase the competition for farms that have been well kept up?—No doubt it would to a certain extent. Of course where a farm has been run out, generally speaking, it goes into the hands of the landlord, and he has to farm it three or four years probably to put it straight. Well, then, when he has done that and thoroughly equipped it with buildings, and so on, he has no difficulty in getting a tenant.

33,647. But my point is this: that so many bad farms do really increase the competition value of the good farms, do they not?—That is so.

33,648. Does not that operate unfavourably to the old tenants; that is, that if an agent can say that "I "have so many applicants for farms, who would offer "so much for the farms, therefore you must go on at "that price?"—I am afraid that agents do not properly and sufficiently consider the case of old tenants. In many cases they are very apt to let the old tenant go, and put men in who have neither sufficient capital nor other qualifications connected with them to take the farm and farm it as it ought to be done. They very often do it in order to maintain a certain standard of rent, and which they can quote as an example to the other tenants on the estate.

33,649. Does not that reasoning which you have just advanced make it desirable in your view to strengthen the position of the tenant either by giving fixity of tenure or compensation for disturbance?—It does; that is one of my main reasons.

33,650. Tenants by a number of various considerations are forced to pay a higher rent than they otherwise would if they were perfectly free?—That is so.

Official arbitrators.

33,651. Now about arbitration; your suggestion, I understand, is that there should be a fixed and certain arbitrator for each district appointed by a district council, is that so?—That is so.

33,652. Do you mean that landlords and tenants in going under the Agricultural Holdings Act would be in all cases compelled to go and bring their case before this tribunal?—By no means; they may settle the matter themselves.

33,653. In case of dispute they would come before this arbitrator or chose their own arbitrator?—Come before this arbitrator in case of dispute. He should be the official umpire. They may be their own valuers themselves. I do not see any objection, and that they should call in this official arbitrator to settle the case.

33,654. In the position of the umpire under the Act?—Exactly.

33,655. Where an umpire is to be appointed under the Act you would have a sort of district county court for agricultural purposes?—You may call them that if you like.

33,656. Is one of your reasons for that that you would have a better uniformity of decisions as to the remaining values of certain improvements?—I think so.

33,657. You prefer that suggestion to the suggestion which has been made in my Bill, and other proposals of giving freedom to the county court and to the parties to select an arbitrator from an official list of arbitrators?—I do not agree to go to the county court judge at all, except in the case of appeal on a question of law. I think myself that the arbitrator for each district is better appointed by the district council. I prefer the district council to the county council.

33,658. Do you think that that would be easily carried out in counties with which you are connected?—I think so. There is no reason why the same arbitrator should not be appointed for more than one district.

33,659. I think you have given some consideration to the Bill which I introduced last session?—I have.

33,660. Does that Bill provide, with one or two exceptions, for all the points which you attach special importance to; one of the exceptions being the one we have just touched upon?—I think it does.

33,661. And do you think that your suggestion that first class improvements should be placed on the footing of drainage, and be either as compensation with consent of landlord, or the decision of an arbitrator that it adds to the letting value? Do you think that represents the view of a large number of farmers in your district?—I think it does.

Mr. W. H. Lander.
1 Nov. 1894.

Substituted agreements.

33,662. As to your remarks on the permissive agreement substituted; would it satisfy you to provide, as my Bill provides, that in all cases of dispute as to whether the substituted compensation was fair and reasonable the tenant could at once have a reference under the Act, or do you think that would not go far enough?—What clause is that?

33,663. Page 3, sub-section 2?—I do not think it would. I do not like substituted compensation at all. I prefer to have an Act of Parliament which should be compulsory and not one that you can drive a coach through, which you can through the 1883 Act.

33,664. You want the Act to be compulsory, and to cover everything as regards agricultural holdings?—Yes, I do.

33,665. Do you think it would tend to convenience and also to justice if you were to include compensation for tillages and crops, and other compensations under customs also?—I think it would. You must bear in mind that the customs as to the tillages vary in different counties. There is that difficulty to be overcome.

Compensation for claims outside the Act.

33,666. I do not think you understand my question. That is where a tenant is entitled to any compensation that he can bring that under the Act by simply entering it in one of his claims?—Yes.

33,667. You think that would be a convenient arrangement?—Yes.

33,668. And the sum settled by the same arbitration and the same valuation, and that would tend to economy?—Exactly, and a saving of expense.

33,669. Have you considered the clause about the compensation for disturbance—the seventh clause—and does that satisfy you in its present form?—Yes.

Landlords' claims.

33,670. Another point which I would like to ask you about is: you wish to have the period within which a landlord may claim for compensation or breach of covenant to be reduced from four years to two years. You are aware that that is covered in my Bill?—Yes.

33,671. You agree with the Central Chamber to a counterclaim being scheduled. Will you give your reasons for that?—My reasons are that it should make the settlement easier, and that valuers and the tenant and the landlord should know exactly the position that they are in. I think that schedule pretty well covers everything. I do not agree altogether with the list in that schedule, the first item "Unduly mowing grass." I do not see why I should be restricted to how many times I should mow a certain field provided I supply adequate manure.

33,672. My question as to the whole of this schedule for landlords' claims for delapidations is this: whether you think that a schedule of this kind would be more convenient, or whether it would be better to let the landlord and tenant make their own agreements and to allow the landlord to recover up to the extent of damages under those agreements?—I think this would be simpler and more convenient; it practically covers everything.

33,673. The 11th section in the schedule is drawn by the central chamber and covers all dilapidations, and practically brings it back to the same point as before, does it not?—Yes.

Official arbitrators.

33,674. About your arbitration, you state that farmers were afraid of the term "land courts," they had an unreasonable fear of the little word. If you have an arbitrator elected in the district assigned to him practically you have started a land court for a great many purposes, have you not?—That you have, but personally I do not like the name of "land court." I should prefer to call it something else.

33,675. You do not allow him to fix rents except indirectly?—Indirectly he would no doubt, but directly, I do not think that the question of rents should be judicially fixed.

Tenure.

33,676. About the leases in your neighbourhood; have you any leases of the same nature as they have in Cheshire, the leases with breaks or power to give up?—No, I think not, the leases have become very rare at the present time.

Mr. W. H. Lander. 1 Nov. 1894.

33,677. A lease starting at a fair rent with power to a tenant to give up a farm at reasonable notice would practically be a fixity of tenure in the best form, would it not?—Probably it might.

33,678. The object of such legislation as you contemplate protecting the tenant by compensation for disturbance, by compensation to the sitting tenant would be to place the tenant farmer as one who had a lease of that kind?—To a certain extent it would—to a large extent.

Farmers' capital.

33,679. (*Captain Owen Thomas.*) You say that farmers are generally short of capital in Shropshire?—I think so.

33,680. Is it because they have lost some capital lately, or did they start with insufficient capital?—The principal reason is because they have lost their money. There is no doubt a great many farmers commenced farming with inadequate capital, and that has been one of the reasons why they have lost what they had got.

33,681. What has become of the capital—in what way have they lost their capital?—They have lost it in their business—the business of farming.

Rents.

33,682. Do you mean paying too much rent?—Paying too much rent and they have received too little for for their produce.

33,683. Would you say that the land is suffering consequently?—There is no doubt about that in many cases.

33,684. Are farmers aware that they are paying too much rent at the present time?—They are aware of it, but they do not know how to alter it. They like to stick to the ship as long as they can, and for various reasons they do not want to leave their farms—perhaps they were born there.

Reduction of rent.

33,685. Has there been an agitation in your county for a reduction of rent?—No, there has not.

33,686. Have any petitions or something of that kind been got up?—No.

33,687. Have the farmers applied in any way privately?—The farmers have applied privately, and I must say this that the landowners of Shropshire have, as a rule, perhaps met them fairly, but I am afraid if things go on that the landowners will very soon be in as bad a plight as the farmers.

33,688. What do you mean by "fairly." You have just stated that the farmers are aware that they have been paying too much rent. That is not meeting them fairly, if they do not reduce the rent to what it should be, or what the farmer can make out of his land?—Well, of course, a good many landlords are not in the position to reduce rents as much as they would like to do. They have certain charges to meet and their hands are tied.

33,689. Do you think that the farmers should suffer for that?—Certainly not, but I am afraid they have to do.

The fixing of rent.

33,690. If farmers are of opinion that they are paying too much rent and the landlords think otherwise, how is the question of rent to be settled?—Well, it is a difficult question, but I think that it is a matter that you might legislate for.

33,691. How are rents fixed in your county, by the higgling of the market or otherwise?—It is generally a question of supply and demand. There is a farm to let, it is perhaps advertised and the rent is fixed so much. The agent or the owner asks so much rent, and some one makes him an offer, and if he considers it a fair offer and the man a suitable tenant, perhaps he is accepted.

33,692. Are the farms which became vacant now let for a reasonable and fair rent?—Some of the best farms which are in a good condition at the present moment command a good rent; but you will find that farms that are in a bad state are not so easy to let and the rent must be considerably lower than it would be if that same farm was in a good condition.

33,693. As to those farms which command a good rent is the rent above the value of the land?—Well it probably is more than the present prices of produce justify; but there is the fact.

Management.

33,694. Are the estates pretty well managed in Shropshire?—Yes, I think so.

33,695. They have experienced agents, I suppose?—Yes, they have experienced agents; there is generally an agent and a sub-agent on our large estates, and some of us think sometimes that the agent leans more to his employer, to the landlord, than to the tenant. Probably that is a part of his duty.

Mr. W. H. Lander. 1 Nov. 1894.

33,696. Are the landlords and tenants on fairly good terms?—Yes, I think so.

33,697. What is the size of your farm?—261 acres.

33,698. Do you keep a farming account?—I do.

33,699. Has your farm paid you during the last seven years?—No, it has not.

Results of farming.

33,700. Have you been losing money?—I have been losing the last few years—the last six or seven years.

33,701. Will you keep it on if you still go on losing?—Perhaps I am fortunate in being in a position not altogether dependent upon what my farm does for me, and, therefore, I daresay I shall be very slow possibly to give it up.

33,702. But it would become serious to another farmer who is not in the position you are?—Yes, and they would have to give it up in time.

Low prices.

33,703. (*Mr. Everett.*) Do you think that any arrangement that can be made to better transactions between landlord and tenant can keep farming in a fairly prosperous condition, if on the whole the prices of produce get year by year lower?—Well I do not think it can, because if prices become so low that they cannot possibly raise the produce at a profit, it is a very bad look-out.

33,704. (*Chairman.*) I think you said you pay 30*s.* an acre?—31*s.* an acre.

Reduction of rent.

33,705. What has been the highest rent you have paid?—My rent was reduced about 5 per cent., my rent would be then 32*s.* 6*d.*

33,706. Not more than that?—Not more than that.

33,707. Then you have had a small reduction yourself?—I have only had 20*l.* in addition to the land tax which I used to pay and the moiety of the insurance.

33,708. What would that come to?—The land tax 4*l.* 13*s.* 6*d.* and the insurance was 2*l.* some odd, a little over 2*l.* Altogether I have had a reduction. My rent was 427*l.* 2*s.* 10*d.*, and I have to-day a reduction of about 26*l.* 10*s.* or 26*l.* 15*s.*, or something of the kind, including the land tax, &c.

33,709. That is a very small reduction?—Very small.

33,710. Would your farm let at the present rate to any other tenant?—I daresay it would.

Change in cultivation.

33,711. Have you effected any change in cultivation yourself?—I have spent a great deal of money on the farm and on the house.

33,712. I mean in laying down to grass, for instance?—Not in laying down to grass, you mean change in the cultivation.

33,713. Yes?—No. I have not effected very much change in the cultivation.

33,714. You still go on growing wheat?—I do not grow very much wheat now.

33,715. But you grow other corn?—Yes, other corn. I grow more barley and oats instead of wheat.

Reduced labour.

33,716. Has there been any reduction in the number of labourers on your own farm?—No. I have got about the same number I have had for many years.

33,717. And you pay them rather high wages?—I pay them higher wages than I did 15 years ago.

33,718. I mean in the neighbourhood, has there been a reduction in the number of labourers employed on the land?—I think there is, generally speaking, and the tendency is now to reduce the amount of labour.

33,719. Have you been able to effect any economies for the purpose of meeting the fall of prices?—I do not quite understand the question.

33,720. Prices you have told us were very seriously reduced. Have you been able to meet them in some way in other directions?—We have been able to use machinery of course, where we used to use hand labour, but in all matters of cultivation and other things we try to be as economical as possible. Of course we cannot make a very great deal of difference.

Rent on a sliding scale.

33,721. (*Captain Owen Thomas.*) What reduction ought there to be in the rent in your county?—Of course rent ought to be based upon the value of the produce. Some people would advocate a sliding scale for rent, but I am afraid it would be too complicated to work well. I do not think that I could advocate a sliding scale for rents.

The witness withdrew.

Mr. W. Richards.

1 Nov. 1894.

Mr. Westley Richards called and examined.

33,722. (*Mr. Little.*) You farm for pleasure at Oakham, in the county of Rutland, I think ?—I call mine business.

33,723. I would put it that you do not farm to live by it; you are not dependent on farming for a living ?—No.

Farmers' accounts.

33,724. What is your great object in coming here to-day ?—To call the attention of farmers to the necessity of keeping accounts.

33,725. And is that particularly necessary in your opinion at the present time ?—I think that it is absolutely necessary for them to conduct their business in the same way as other producing industries conduct it.

33,726. Do you think they do not ?—In my district they do not.

33,727. Do you farm grazing land ?—I farm grazing land.

33,728. Feeding land of good quality ?—Yes.

33,729. You hire part of it ?—Yes, a small part of it.

33,730. And you own a part ?—And I own a part.

33,731. And you have carried this farm on for some years, principally, I understand, with a view to making yourself acquainted with the business of farming ?—That is so.

33,732. You have endeavoured to conduct your business on strictly commercial principles ?—That is so.

33,733. To make a profit, if possible ?—Yes.

33,734. And you have kept regular accounts ?—Yes.

33,735. And those accounts you are ready and willing to put before the Commission ?—Yes. (*See* Appendix II.)

33,736. They are given in great detail ?—Yes. Then the object I have in view is to call farmers' attention to the necessity of keeping some simple form of account in order to show them, when losses occur, *where* they occur, which their bankers' book does not show them. A receipt and payment account of the same kind as adopted by the Inland Revenue, but with rather more detail, is all that is necessary. Any farmer who can read and write, or a board school boy, could put down the receipts and payments every day. These must be balanced once a week or once a month, to see that there are no omissions. This would form a cash-book, and give a true history of all cash transactions, and from this a proper balance sheet could be made, either by a village schoolmaster, or, in case of large farms, by an accountant. In order to facilitate comparisons of farming operations in different districts, it is absolutely necessary that one uniform method of rendering such accounts should be adopted. Many farmers scarcely appear to have realised the great change that has taken place in all farming operations by free importations of foreign agricultural produce. They must follow the methods adopted by other producing industries, give up guessing, and watch figures. Good accounts are the life and soul of competition. Farming has become a very difficult business to follow profitably. A farmer's attention should be turned to diminishing the cost of production and increasing the quality of the commodity produced. Farm accounts are not so easy to keep as accounts of other producing industries, as the amount of agricultural production is so greatly influenced by the weather. This must always be the case. It is, therefore, necessary that an average of years should be taken, not less than seven or ten years. Good accounts are not a remedy for agricultural depression. They will only enable a farmer to know what he is doing, and those farmers who cannot make farming pay at present prices and under present conditions, should give it up.

33,737. Why do you think that the accounts should be of a uniform character ?—Because if you get half a dozen different methods of keeping accounts you cannot compare one with another.

33,738. You cannot compare them ?—Not without a great deal of trouble. I want to see a uniform system so that it can be carried on year by year, and so make a comparison in the different districts.

33,739. A comparison of the amount of produce ?—Yes.

33,740. And of the cost of production ?—Yes.

33,741. And of the different items of the cost of production, such as rent, labour, and other expenses ?—Yes; and those are all given in my accounts.

33,742. But this of course will vary with the different qualities and descriptions of land ?—There are no two farms alike, but still the accounts may be kept alike.

33,743. You are familiar with the form which the Ireland Revenue Department adopted ?—Yes, this is it (*handing in the same*).

33,744. What remark have you to make on that form ?—I simply want to put the details in. They put the total amount under each head. I want to put the details, because the details must exist in a receipt and payment account.

33,745. But the form is sufficient for this particular purpose, I presume ?—Sufficient for the Inland Revenue purpose.

33,746. It is sufficient for profit or loss, but not to show where the profit or loss occurs ?—My accounts give a valution of live and dead stock.

33,747. At the commencement and close of the year ?—Yes.

33,748. But probably you are aware that that is what farmers have said it was difficult to give ?—I do not see any difficulty about it.

33,749. But was it not regarded as a concession on the part of the Inland Revenue Department when they said that they would dispense with that ?—That was because farmers hardly keep any accounts.

33,750. That was a concession to weakness ?—Yes.

33,751. But you think it is necessary for a proper account to say at the beginning of the year what was in hand in the way of stock, and at the end of the year what was then left ?—I think it is necessary, and that is what I do. A valuation is made in the usual manner.

33,752. Your account differs from the Inland Revenue form in that it gives details, and that it adds a valuation at the beginning and end of the year ?—That is the only difference.

Receipts and payments on his own farm.

33,753. You have given here in full the actual receipts and payments on your own farm for three years ?—Yes.

33,754. And they are summarised, and the result is shown for the first year at page 7 (*see* Appendix II.) ?—Yes.

33,755. You give the number of acres, the rent, the labour, the profit, the gross returns, the capital employed per acre, and the total amount of these items, and both the amount of profit and per-centage which that profit pays on capital ?—Yes.

33,756. The whole farm is about 84 acres ?—Yes.

33,757.—A part of it being your own, and part of it rented. And the rent is 46*s.* for a part, and 50*s.* for a part; that includes the tithe ?—Yes.

33,758. It is entirely a grazing farm; the labour is shepherd's wages, and extra in hay making. In the first year it seems that you got a profit of 96*l.* on the 84 acres, and that was 8·39 per cent. on the capital ?—Yes.

33,759. Then the next year at page 13 (*see* Appendix II.) you have the same number of acres, the same rent, the labour practically the same, the returns per acre very much the same, 19*l*; the profit 28*l.*, or 2·72 per cent. on the capital. That was a less favourable year ?—Yes.

33,760. Well then I come to the third year; at page 17 (*see* Appendix II.) you give a summary and analysis of the accounts for the year ending April 30th, 1894. You consider that your grazing year begins on the 1st of May ?—Yes.

33,761. And the rent here is somewhat reduced; part of it is charged at 40*s.* ?—I knocked off 6*s.*

33,762. You were in a position to reduce your own rent ?—Yes, I found that I was charging myself too much.

33,763. And then the returns per acre instead of being 19*l.* odd, were reduced to 15*l.* odd ?—Yes.

33,764. And the total loss was 241*l.* 10*s.* 3*d.* ?—Yes.

33,765. And that is a loss of 23·72 per cent. on the capital ?—That is so.

33,766. That is in consequence of the disastrous grazing year of 1893 ?—Yes; it shows for itself. I generally get 5*l.* profit on my cattle; this year I got 6*s.* 8*d.*

33,767. On page 18 (*see* Appendix II.) if you look you give a summary account of the number of beasts sold, and the average gain for the grazing after the cost

Mr. W. Richards.
1 Nov. 1894.

was paid, was 6*s.* 8*d.* each beast?—Yes, and the usual profit is 5*l.* per beast.

33,768. In the year before it was 3*l.* 9*s.* 2½*d.* Now the cost of grazing is made up of the rent and the expenses of every kind. It is entirely a grazing farm?—Yes.

33,769. (*Viscount Cobham.*) Is it a park?—No.

33,770. (*Mr. Little.*) It is pasture; the return was 4*l.* 12*s.* 11½*d.* the first year, per head of cattle; that is to say, the sum left after deducting the cost from the amount of sales. It was 3*l.* 2*s.* 9½*d.* the next year, and 6*s.* 8½*d.* for the last year?—In addition to that what I generally have is 120*l.* or 130*l.* of hay and those two items account for the whole loss.

33,771. It is a very striking instance of the effect of the season of 1893 upon your grass land, that whereas you had made a profit on the two previous years of rather more than 5½ per cent. on the average, you then in the next year lost 23 per cent.?—I lost 23 per cent. on the capital.

33,772. The total loss was 241*l.* 10*s.*; and the total amount of the rent, rates and taxes was 190*l.* 17*s.* 6*d.*?—Yes.

33,773. So that if you had paid no rent, or rates, or taxes, you would still have been a loser to a considerable extent in that year?—Yes.

33,774. And if you take the landlord's rent, leaving out the rates and other outgoings, you lost a year and a half of such rent in that year?—Yes.

33,775. But if you had been in the position of an ordinary tenant, and your landlord had wished to make up your losses, he would have had to sacrifice his whole rent, and give you a half year's rent beside. That was the effect of that year?—Yes.

33,776. But you maintain that is an entirely exceptional year?—Yes.

33,777. And from your own experience on an average of years a profit can be made?—A profit can be made.

33,778. And how can that profit be best made in your opinion?—I think almost everything depends upon buying in stores. I do not breed, I buy my stores in and everything depends upon buying in stores, and I will show you the system which I pursue.

His system of buying in stock.

33,779. Will you explain your own particular system of buying in your stock?—I have a purchase and sale account. Here is an instance: 16 Welsh runts cost me 17*l.* The carriage from Harborough and the commission adds about 10*l.* to it. I rest those beasts 10 days in order to bring them back to the original weight when they left their own farms when they weighed 78 stone 12 lbs.

33,780. You wait a fortnight after delivery, and then, the weight being ascertained, the cost is divided by the weight, and in this case they cost 4*s.* 5*d.* per stone live weight?—On an average of years they put on 22 stone; they put on 25 or 26 or 27, but they lose 5½ per cent. in going to London, and it is only 22 stone I have to sell and that is all gain.

33,781. That is the gain of live weight during the grazing period?—Yes, but it is not enough to pay me, I want 78 sixpences.

33,782. When you have got your 22 stone you cannot afford to sell that at the same price that the store cattle cost you?—No, outside that I want 78 sixpences.

33,783. Sixpence a stone higher price for your fat cattle than the store cattle cost, and you want 22 stone of increase in addition?—Yes.

33,784. You cannot buy them just at what price you like?—But I will not buy them if I have got to give more than the 6*d.*, which I know they will make. Some years I have sold at 4*s.* 10*d.* per live stone.

33,785. But you must buy them at market price?—I always buy them at the price I want them.

33,786. Supposing the price of meat is 4*s.* 10*d.* you would want to buy store cattle at 4*s.* 4*d.*?—Yes.

33,787. And that you can make a profit, except in a year when there is no grass, like 1893?—Yes.

33,788. That is the system you pursue, and which you would recommend to other farmers?—Yes. What happens is this: I buy my beasts always in March and April; farmers often put off their buying here till the grass comes; the consequence is that they have to give a great deal more than the things are worth.

33,789. You are strongly in favour of the weighing of both store and fat cattle?—Certainly.

Mr. W. Richards.
1 Nov. 1894.

33,790. And you weigh yours regularly and register their increase?—Always, every 28 days.

Sale by live-weight.

33,791. And keep a watch on their progress?—Yes, and directly they stop gaining it is time to sell them.

33,792. Do you find that they are at all put out of condition by being weighed?—Not the least.

33,793. You were very active in persuading the Government and Parliament to legislate upon this subject?—I found that I could not make out a balance sheet without I had the facts as the basis of calculation, and the custom was to guess at the weight of carcase a fat beast would yield. It was not possible to put a guess into a figure.

33,794. But you knew the balance there was between the costs and the receipts, though you did not know what it was per stone?—But I want a fact as the basis of calculation, not a guess.

33,795. And in your dealings with the butcher you wanted the facts, I suppose?—I wanted to know the facts.

33,796. You wanted to know what you were selling?—The quantity I was selling.

33,797. And he did not care particularly that you should know?—I have not found any difficulty with the butchers.

Cattle weighing machines.

33,798. But taking the butcher ordinarily, he does not want to buy weighed cattle?—Of course he does not, because he knows that he buys the thing very much less than the weight that he estimates it at. What was necessary for me before I could make out an account was to keep the live weight as a basis. Well, before anything could be done it was necessary that there should be weighing machines in the market, and I got a Bill passed myself in 1887 to compel all markets to put up weighing machines.

33,799. Have you any remarks to make as to the way in which that Act has been carried out?—Since that Act was passed there has been a new kind of machine invented, a self-acting machine which only records in hundredweights and quarters, that is 28 lbs., and if it so happened that a fat beast weighs practically hundreds and one quarter, it is all right, but in 99 cases out of 100 it does not weigh that, and the consequence of that is that it gives a short weight, which is a false weight.

33,800. It might give 27 lbs. of live meat to the buyer?—In favour of the buyer and the dealer.

33,801. And 27 lbs. of live meat is worth something?—It is worth 4½*d.* a pound.

33,802. It would make a considerable difference and pay the carriage?—Yes; considerably more.

33,803. Do you think that such machines ought to be prohibited?—I think new machines for a valuable commodity like cattle or other agricultural commodities ought to weigh to 1 lb., with the customary allowance given in the instructions to inspectors.

33,804. The Board of Agriculture have the power of refusing to certify those machines, have they not?—It is the Board of Trade, I think.

33,805. There is a department for the purpose?—The Weight and Measures Act requires it.

33,806. And you would make it imperative on the Board of Trade to refuse their certificate to such a machine?—To a machine that did not record the weight to 1 lb., with the customary allowance.

33,807. The Board of Agriculture has to do with compelling markets to provide machines, has it not, and the Board of Trade has only to do with the stamping?—That is the Weights and Measures Act.

33,808. (*Mr. Giffen.*) The Board of Trade has a standards department as a part of its general function, but that has nothing to do with the special legislation for weighing machines in fact?—Quite so.

33,809. (*Mr. Dalton.*) The central department for the Weighing Machines Act is now the Board of Agriculture; it used to be the Local Government Board, but their powers were transferred to the Board of Agriculture, and the Board of Agriculture now is the authority?—I believe so.

33,810. (*Mr. Little.*) Whatever the department may be, would you call upon them to insist upon a machine not

Mr. W. Richards.

1 Nov. 1894.

being certified that does not weigh down to 1 lb.?—Down to a pound, but there is an allowance.

33,811. For deviation or error?—A customary allowance. In any case, for instance, they paid what they call a surprise visit the other day, and my machine has been up seven years; for its age and capacity the customary allowance would be about 6 lbs.

33,812. The county inspectors of weights and measures in examining machines give them a certificate when they do not vary more than a certain number of pounds?—Yes.

33,813. And your machine might have been allowed a variation of 6 lbs., but it had only a variation of 2 lbs.?—Yes.

33,814. After being in use seven years?—Yes.

33,815. (*Viscount Cobham.*) What does it weigh up to?—Eight tons; it is a steelyard machine.

33,816. (*Mr. Little.*) You think that what you have provided for yourself is a machine which the local authorities might be compelled to provide for use?—I think so.

33,817. Have you any other remarks to make on the subject of weighing of cattle?—No. Of course, I have said that I do not think that those machines ought to be stamped that do not record as low as 1 lb. It matters very little in large machines where they are sold in tens or 15 or 20; or in America where they are sold in 50 or 60—it matters very little the 28lbs. But where you have a fat beast weighed one at a time it is of very great importance.

Agricultural Holdings Act.

33,818. You have some suggestions to make as to the amendment of the Agricultural Holdings Act, have you not?—Yes. The Agricultural Holdings Act is said not to work in a satisfactory manner. A tenant under the Act upon quitting his farm can make a claim for unexhausted improvements, such as cake consumed on the land, or any other scheduled improvement, and a claim for waste, deterioration in buildings, gates, cross-cropping, and other matters can be made by the landlord which sometimes amounts to more than the tenants claim for improvements. I think it would be more satisfactory if the state of the buildings and condition of the farm at the time the tenant entered upon occupation, was taken and recorded by competent valuers, and in case of any disagreement arising, an umpire to be appointed in the usual manner. A signed copy of this record to be held by each party to the contract, no money to be expended in improvement on buildings, drainage of land, &c., for which any claim may hereafter be made to be carried out without the written consent of the landlord. Any claims that are to be made by either landlord or tenant to be made on a specified day in writing signed by both parties, if such claims are not then made, the claim to be invalid. The date specified might be the one on which the tenant leaves (enters upon) the farm. The tenant on quitting his holding to be bound to leave the farm in as good condition as when he entered upon the occupation of it, and if the condition of the land was improved to receive compensation for improvements but if deteriorated, the landlord to receive compensation fer deterioration. It would of course be necessary for the landlord to have a watch kept upon the cultivation of the land to see that it was not being run out and deteriorated, and also to have the power to dispossess the tenant in case of such deterioration, at a shorter notice than specified by the present Act, say one year in place of two. The above suggestions for an agreement would require to be put in a legal form.

33,819. The first point is to have a record of the condition of affairs on entering?—Yes.

33,820. You are not in favour of allowing the tenant to make whatever improvement he pleases without the consent of the landlord?—No, not if he intends to claim compensation for those improvements.

33,821. You think that the claims of the landlord and tenant should be made at the same date?—They should be made on the same day.

33,822. And that the tenant should be bound to leave his farm in at least as good condition as when he entered?—Yes.

33,823. But if he has improved it he is entitled to compensation?—Yes.

33,824. Those are the principal points?—Yes; and that a provision should be made for each person to appoint an assessor of the condition, and if when leaving there was any dispute, instead of the tenants going to law they should appoint an umpire and abide by whatever that umpire determines.

Mr. W. Richards.

1 Nov. 1894.

33,825. Would you give any appeal from the arbitrators or their umpire?—No.

33,826. This is dealing with the questions of dilapidations or improvement as a result of a comparison of the records, and then a balance to be struck, I understand. You are dealing entirely with the claims for dilapidations, or for improvements during the term of holding?—Yes, during the holding.

33,827. You would strike a balance between the improvements and deteriorations, and hand over the money to the party to whom it was due?—Yes.

33,828. You do not touch the question of the ordinary tenant right as to crops and manures, and all that?—No, the object is, to get tenants to improve the land rather than to deteriorate it.

33,829. Mr. Lambert wished me to ask you whether you lived out of the farm besides that profit that you made?—No; you will find in the accounts what I take for the farm, and I pay it all. On page 17 (*see* Appendix II.) you will see "farm produce supplied to house and stables"; the details are given.

Profits on his own farm.

33,830. (*Mr. Lambert.*) How do you expect a farmer to live? Your system of book-keeping has not given you sufficient profit to enable the farmer to live, and get a decent return for his money?—Take an average farmer—with about 80*l.* a year. I can give an instance where a certain number of gentlemen have found capital for farmers who have not had sufficient capital for their farms—a certain number of gentlemen have found capital and put in a manager, and told this manager that, "Unless you can make 5 per cent. of this "capital you will go, and I shall get somebody else "who will do it." In this case there are seven years; it is a co-operative farm, under the Limited Liability Act, and in this case they have made 8·4 per cent. on an average for seven years, and that is owing to good management.

Profits on a co-operative farm.

33,831. When did those seven years begin?—From 1887 down to 1894. That shows you what good management can do.

33,832. (*Mr. Gilmour.*) Was that dairy farming?—No, it was a mixed farm of about 606 acres.

33,833. (*Mr. Little.*) In what part of the country?—In Lincolnshire, at Ormsby. It is a limited liability company, and these accounts are all published.

33,834. (*Mr. Lambert.*) In this case in 1893 they made 4·69 per cent., and in 1894, 4·22 per cent.?—Yes, those were two bad years; two of the worst years.

33,835. But that would not tally with your own experience, for you made a loss of 23 per cent.?—But I do not think that is the same year. My loss is 1893; up to the 30th April 1894.

33,836. They are here in this account, 1893–4?—Well then, all that I can say is, that they were much better off than I was, but I mean to go and look at the farms. There would be plenty of capital forthcoming if you can get 5 or even 4 per cent. for the money. And there are several farms, Lord Kintour has got one in Scotland, a very good farm, and he is trying to do the same thing; Lord Spencer has got another.

33,837. (*Mr. Dalton.*) What is the rent of the Lincolnshire farm; you have charged a very high rent?—I have reduced it, because I found it too high last year.

33,838. Is it not a very high rent to charge; there is no farmhouse?—There is no farmhouse. I took it upon the annual letting. We let the grazing by auction and it was 1*l.* 17*s.* per acre.

33,839. (*Mr. Lambert.*) Do you know how the rent is regulated upon this farm?—That is one of those farms, which is let on a corn rent; I do not at all agree to that; I do not think it is possible; it has been tried over and over again, but in every instance it has been given up.

33,840. Because this farm in eight years has paid 1*l.* per acre, and in 1889, 16*s.* 3*d.*, and in 1891, 26*s.* 7*d.*; and now it has come back to 18*s.* 8*d.*?—Yes, it has been regulated by the price of produce. It is a thing tried constantly, and always given up; farmers do not like it. They do not know till the year after what they have got to pay.

Mr. W. Richards. 1 Nov. 1894.

Block tests.

33,841. (*Mr. Little.*) You have made some estimate of the error that farmers fall into as to the value and weight of their cattle, have you not?—Yes.

33,842. And you put in some statistics?—It is all here; out of 2,801 farms, the errors between the highest and the lowest was 24 stone, 6 lbs., and 9*l.* 8*s.* 3*d.* in money.

33,843. The variation between the highest guess and the lowest was 24 stone of meat?—Yes, of meat. I got these accounts from the secretaries and all these are guesses at what are called block tests.

33,844. Are all these guessing competitions published in the book which you have distributed to the Commissioners?—Yes, and the butchers' guess was just about twice as good as the farmers.

33,845. The average variation in the case of farmers' estimates was 21 stone, 7 lbs.; and in the case of the butchers' it was 11 stone, 4 lbs.?—That was the second lot of farmers' guesses, 21 st. 7 lbs. (14 lbs.), but the first lot was that 24 stone 6 lbs.

33,846. In one table the average variation was 24 stone, 6 lbs.; and the next was 21 stone, 7 lbs.; and in the butchers' case it was 11 stone 4 lbs. Do you know whether it was attempted to obtain guesses from competent people?—They would not have paid for their tickets unless they thought they knew something about it.

33,847. They were judges of their own capacity?—They thought that they were.

33,848. Enough to make a guess?—Yes, or they would not have bought a ticket.

33,849. It was not a sort of sweepstakes for a prize?—I believe there was a prize in some cases. There are all the details of every one of these cases set out in the book, pages 6, 7, 8, and 9.

33,850. In some cases there was a very large number of estimates?—In some cases a very large number; 176 farmers made an estimate, and then you have recorded the actual carcases weighed, and the highest estimate and the lowest estimate. That is all that I have been able to get.

33,851. And in your proof you say that a great many people who think themselves capable of estimating weight are proved to have no idea about it?—They do not know anything about it, and therefore there is a competition for rents by people who do not know the value of the commodity they produced, and therefore it is of no use, that competition price does not show what the rental of the land should be.

Landowners and practical farming.

33,852. Have you anything else you want to bring before the Commission?—I think that it would be very desirable for all landed proprietors to occupy a certain quantity of land in order that they might understand the business of a landed proprietor; they must not be pleasure farms, but business farms, and if they did that I think they would be able to show the tenants how to keep accounts.

33,853. And they would sympathise with their tenants?—I think they have no other way of fixing what a rent should be, unless it is the keeping of accounts.

His system of fattening bullocks.

33,854. (*Viscount Cobham.*) You keep no sheep on this land?—No, sheep are very bad for grazing bullocks; they eat all the heart out of the grass.

33,855. You call it good bullock feeding land?—It is not first rate.

33,856. (*Mr. Little.*) It requires some cake?—It is good in May, June, and July. They do well in those three months, and put on more live weight than later, and on the 1st August I give 8 lbs of cake per day in order to finish them.

33,857. And they all finish from grass?—Yes.

33,858. You never house them?—I have got no place to feed cattle in the winter.

33,859. And what do you put on in winter?—I buy a few stores to clean up some rough grass if there is much left.

Mr. W. Richards. 1 Nov. 1894.

33,860. (*Viscount Cobham.*) You buy them before your grass is grown in order to get them cheaper?—I buy them in March and April. I have got three acres of arable land, and on that I grow mangolds, and if I buy beasts in March or April, I give them a few mangolds per day, and 4 lbs. of decorticated cotton, and that keeps them to the weight they are when I buy them.

33,861. Till the grass is grown, in fact?—Yes, and on the 1st May they are turned out, and they get their own living in May, June, and July, and they put on a great deal of weight; they put on an average of about 2 lbs. a day; that is an imperial stone a week.

33,862. By what time have you finished them generally?—What I do is this. I sell to one or two butchers, and I find out from them what it is they want. My butcher says, "I want a beast to dress, to yield 58 per cent. of carcase," and I do not send him these beasts, until I know they do that; and in the case of Welsh runts, I am content with 58 per cent, because they have got very thick hides, and it adds to the weight of offal, and hides are very valuable.

33,863. What is the average cost of their keep?—It varies. I have sold a quantity at 4*s.* 8*d.* live stone, and those beasts have dressed to 58 per cent. or a little over.

33,864–5. And you bought them last March?—Yes.

33,866. (*Mr. Little.*) Do you remember what they cost you per stone?—4*s.* 0½*d.*

33,867. Then you got your 6*d.*?—Yes; and rather more.

33,868. You got 7½*d.*?—Yes.

Cattle weighing machines.

33,869. (*Viscount Cobham.*) Should you recommend farmers to provide themselves with weighing machines?—I have no doubt it would pay them to do it. A great many farmers are doing it in Scotland, very few in England.

33,870. Weighing up to what amount in weight?—I think a farmers' machine to weigh one beast would be enough, say 120 stone, and costing 20*l.*

33,871. But that would not take a cart?—Any machine for a village should be able to take a cart, also a waggon, and that would cost 70*l.*, the same as the railway machines. The railway machines are, I think 9 ft. by 7 ft. and they take a waggon, but you want a machine for a village to take a waggon, because you weigh coals, and straw, and hay, and all those kind of things.

33,872. But you can get a machine weighing up to three tons for very much less than 70*l.*?—I do not think you can get a railway machine for less.

33,873. (*Mr. Little.*) But what does a small machine for weighing cattle cost?—20*l.*

33,874. (*Viscount Cobham.*) But a machine say for a hundred acre farm need be only a machine for weighing a beast?—I think that would be quite enough.

33,875. And about 20*l.* it would cost, you say?—Yes; there are machines made for less, and one maker would make them for a good deal less if the farmers combine and give an order for a certain number.

33,876. (*Mr. Clay.*) Are not some machines made for about 12*l.*?—There may be a machine for a cart, only just to weigh the wheels, and a leg to prop the shaft up; it may be that, I do not know.

33,877. But any joiner can make a cage for the machine?—It ought to be iron I think, it is so much easier to be moved. Mine is not, I have got a wooden one myself, but I think that it ought to be iron.

33,878. (*Mr. Dalton.*) Do you think it would pay to provide one of those farmers' machines for every village?—It very much depends upon the village.

33,879. Well, for a good many parishes?—I think it would.

33,880. Should the parish council have power to provide one, or do you think that the farmer should provide it for himself?—The farmers, as a rule, in England are very much against weighing; they say, I understand, it is an insult to say we want to weigh our cattle. But in Scotland it is very much on the increase.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Sixty-first Day.

Friday, 9th November 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allstone Channing, Esq., M.P.

John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. A. Arnold.

Mr. Arthur Arnold called and examined.

Mr. A. Arnold.

9 Nov. 1894.

9 Nov. 1894.

Free Land League.

33,881. (*Viscount Cobham.*) You have been President of the Free Land League since its formation in 1885, I believe?—Yes, and I may add that it includes more than 130 members of the Legislature, that is, of both Houses. I should like to say that, although I am requested by the Executive Committee to attend here to-day, yet I do not feel qualified to speak for anyone but myself.

33,882. You have for many years given much attention to all questions relating to the tenure of land in connection with agriculture?—Yes, I have.

33,883. And you wish to show that the objects of the Free Land League bear directly upon the present depressed condition of agriculture?—I think they have an important bearing upon that question.

Accumulation of land on large estates.

33,884. Perhaps you will explain that in the course of the examination. You are prepared to give figures as to the accumulation of land on large estates?—Speaking first of the United Kingdom, it appears from the most trustworthy evidence available, which I suppose still remains that of the return obtained by the late Lord Derby in 1874 and 1875, that in the United Kingdom there is upon 52,000,000 acres, no estate smaller than 1,000 acres, and that 525 members of the House of Lords hold fully one fourth—more than one fourth—of the land of the whole country. Turning to England and Wales, it would appear that while the total area of England and Wales is about 37,000,000 acres, the owners of estates of 1,000 acres and upwards are returned as 5,408, and the extent of land held by them, exclusive of the metropolitan area, of waste land, of woods and forests, other than saleable underwoods, amounts to 18,695,528 acres. But in that return, which is sometimes very fallacious—of its errors, I will give an example in the following instance—there are four peers returned as 44 landowners, and one, the Duke of Bedford, is returned as 10 landowners, so that I think it fair with regard to England and Wales, to say that about 3,500 own fully two-thirds of the whole of the country; and I will put it shortly that in England one-third of the land is held by 750 persons, and two thirds by 3,500 persons. Of those 52,000,000 acres of the United Kingdom, I believe that the greater part, and not only the greater part, but that nearly the whole area, is under the disability of settlement. And certainly there is a great portion of the country, a large portion of the small remnant of the country, in smaller estates which are also settled, so that it could be hardly an extravagant statement to say that in the United Kingdom there are something like 52,000,000 acres of settled land. That I think to be a very great evil, and indeed the protection of large estates by the practice of settlement gives rise to many evils. It promotes the accumulation of land in large estates; it prevents the wholesome operation of the law of insolvency upon those estates, because the settled land does not pass to the assignee in bankruptcy; and it also impedes the establishment of the best system of transfer by the limitations which are involved. But I further think that the settlement of land, and the accumulation of land in large estates is very injurious to agriculture, because it tends to prevent the multiplication of energetic minds given to the cultivation of the soil. I think experience shows that men will not give the utmost of their ability to cultivation unless they have a certain fixed tenure, and a strong hold of the land; and that, the system of settled estates—the accumulation of land in large estates—tends to prevent.

33,885. With reference to the figures you have given to us, you will admit that they are very largely speculative?—No, hardly that; they are obtained by myself very carefully from the returns.

33,886. From Lord Derby's Blue Book?—Yes.

33,887. Was not that an exceedingly inaccurate document?—I have stated that it was very inaccurate in one particular—that four peers were returned as 44 landowners.

33,838. And countless mistakes were made in other directions, in all probability?—I do not think that the matter I have given is open to that; I see no reason for saying that the figures are not fairly trustworthy.

32,889. In some instances persons would be credited with more land than they have, whereas in other instances, such as you have mentioned, they have split it up into 44 personalties. For instance, I am credited with a considerable estate in Herefordshire, which has no existence whatever?—That may be so.

33,890. (*Mr. Little.*) On that point, might not a trustee for several individuals be put down as a single owner?—That would be possible.

33,891. (*Viscount Cobham.*) However you quote the Blue Book for what it is worth?—Yes.

33,892. (*Mr. Channing.*) May I ask you to repeat the figures you have given; I think you said there were owned by how many persons?—I said from that Blue Book that it appeared, and the statements do not invalidate the book in this respect—that one-third of the land of England was held by 750 persons, and two-thirds were in the hands of 3,500 persons.

33,893. (*Mr. Giffen.*) Would it not be the correct thing to say that one-third of the country is nominally owned by 750 different ownerships, but as to the number of persons you have no information?—Well, when I speak of owners I mean limited owners. In most of these cases there is a limited owner.

33,894. Are you not speaking of ownerships and not of owners, because one of the ownerships might represent half a dozen persons or more?—The nominal ownership of settled land is generally in the tenant for life.

33,895. It may be in the hands of trustees?—It may be; there would be one person generally in the enjoyment of the land.

33,896. But if there is a tenant for life it does not show all the people interested in the land; it is not ownership really?—No.

33,897. (*Viscount Cobham.*) But whatever deductions are made, you consider it established that property in land is not nearly sufficiently distributed?—Not nearly sufficiently distributed.

Law of settlement and entail.

33,898. And you would abolish the law of settlement and entail simply because it protects that existing system?—Because it protects the estate against the wholesome operation of insolvency, and because it impedes the possibility of the best system of transfer.

33,899. What course would you recommend for carrying out your views?—Essentially, and to go to the heart of the matter, it would be necessary that, as in Germany, for example, 12 years of undisputed occupation with *primâ facie* evidence that the ownership had a legal commencement should entitle the owner to an absolute title. What I should like in England would be 10 years of undisputed possession with *primâ facie* evidence that the possession had a legal commencement as entitling the owner to an absolute title, an indefeasible title.

33,900. You mean 10 years beneficial possession?—10 years beneficial possession, undisputed possession, actual possession.

ife l enancies.

33,901. That is to say, in other words, you would abolish life tenancy?—It must be, because it may continue the disability for 60 or 70 years, that is for six years after the life falls in.

33,902. Do you apply this to all land, or only agricultural land?—To all land, but I thought we were speaking generally of agricultural land.

aw of rimogeni- ure.

33,903. What other alteration of the law would you suggest?—Incidentally, to pass shortly over the objects of the League, we propose to abolish the law of primogeniture, which never operates except to work injustice, and we think perhaps, if that law were abolished, that the practice would be less observed than it is now. We also propose, and in order to obtain the best system of registration of title, we are anxious that one system of tenure should generally prevail, and that should be freehold tenure. With that view we propose the abolition of copyhold and customary tenure. I remember Sir James Caird spoke of them as "injurious and obstructive," and as "a species of control, worse than double ownership."

opyhold nd cus- omary enure.

33,904. Are you aware whether copyhold tenure is favoured by copyholders or not?—I think some of them are not aware what advantages accrue from a better system.

33,905. It is a simple system?—It is a very simple system, and in the best examples it somewhat resembles a system of registration of title. Sir James Caird recommended that copyhold should be abolished in 30 years. I am in favour of a law which should declare that after a certain period all copyholds should become freeholds. Sir James Caird suggested that the period should be 30 years, I think that that is greatly too long, and that five or perhaps ten—I should prefer five—would be sufficient.

33,906-7. A Bill was brought in to provide at the next surrender of every copyhold tenancy there should be a compulsory enfranchisement. Do you consider that that would meet your views?—That passed some three years ago?

33,908. It was not passed?—I do not think it would meet my views. It might prolong the great disadvantage of the system of tenure which in many cases is objectionable.

33,909. You consider that a period of five years would be better and would work no injustice?—I think there would be no substantial injustice if five years were fixed.

33,910. You would prohibit the settlement of land upon unborn persons?—Most certainly.

ompulsory istration title.

33,911. What information have you to give us with regard to the registration of title?—Since 1870, I think five Lord Chancellors have introduced Bills dealing with this subject, all of which had the feature of compulsion, but none of which has obtained a very large measure of popular support. I attribute that mainly, perhaps to the fact that these Bills offered no sufficient advantage to the landowner in return for the requirement of compulsion. They offered him three forms of title, possessory, qualified, and absolute; and I think, without distinction of political party, that suggestion has been mainly carried through all the Bills; and possessory title does nothing whatever to relieve landowners from the possession of deeds, from the custody of deeds, or the cost of dealing with them, and in fact, enhances the cost of transferring his land. It has seemed to me absolutely necessary for the fair advantage of the landowner that if we require compulsion in registration, we should give him a substantial advantage. Therefore, what I want to get to is this: that when compulsion operates with regard to the registration of title, it should always be accompanied by the giving of an absolute and indefeasible title. That would be practically impossible under existing circumstances, because, to take only the case of building societies, in which there are 600,000 members—to compel everyone of those persons to go through the cost and trouble of acquiring the absolute and indefeasible title would involve them in such heavy expenses that it would be opposed in every direction. Therefore, what we require is such an amendment of the law as I have previously suggested, say that undisputed possession for 10 years with *primâ facie* evidence that it had a legal commencement, should entitle a man to an absolute and indefeasible title. We want the law relating to limitations so amended that we believe, in practice, there would be few or no bad titles; few titles that could not be accepted; and we should like compulsion to operate in the first case only, in the sale and transfer of freehold land, so as to limit reasonably the business of the department, and not to impose, say, upon mortgage or leasing the heavy cost of the investigation of title. If the law were amended in these directions so as to make the limitation over a comparatively shorter period, and the compulsion were limited, in the first place, to the transfer of real estate, the fee simple title, we believe that there would be no substantial difficulty in the operation, for the dealings would not be too numerous to cope with; and we should then desire that registration of any inferior interest, whether of mortgage, or lease, or otherwise, relating to the land upon the register should also be compulsory.

33,912. Where would registration come in under that system?—Under that system it would be compulsory upon the sale of freehold land only, and then the root title being on the register in the case of this freehold it would be compulsory upon any subsequent dealing with the land.

33,913. There would be no compulsory registration before the next devolution of the property?—There might be registration of a possessory title. But it should be compulsory to have an indefeasible title upon sale or transfer, and that the law should be so amended.

33,914. It would be compulsory at that stage only?—At that stage only.

33,915. But permissible at other stages?—There could be no objection to entering the possessory title when he was not going to sell. I want the landowner to obtain substantial benefit. Now he is compelled by the Bill lately before Parliament, introduced by the present Lord Chancellor, to obtain registration. His solicitor would naturally advise the cheapest form in the possessory title, which would still leave the deeds in the solicitor's hands. The landowner obtains no better price, of immediate benefit he obtains none.

33,916. How would you provide against frauds?—I would have insurance upon the transaction. Experience shows in Australia—I believe there is no insurance fund in Germany—but in Australia there is an insurance fund of one half-penny per cent. or something of the sort, and the fund accumulates. In Germany the fees are available for any case of the sort, but from all experience, frauds are extremely rare, and much more difficult to carry out than under the present system of conveyance by deed.

33,917. Would not frauds be comparatively easy in England, having regard to the complexity of title?—I think very much less than under the present system.

33,918. I mean as compared with other countries?—No, I should think not.

33,919. What they have done to provide against fraud would be sufficient here, would it?—Yes, because the sales of land in England are so few, and changes of ownership certainly as compared with other countries in the world are much more rare, and, therefore, the titles would be more simple.

Mr. A. Arnold. 9 Nov. 1894.

33,920. Have you anything further to add about the Land Transfer Acts and the registration of title?—No, I should be happy to answer any question where my statement has been imperfect.

Settled Land Acts.

33,921. Have you considered that facilities for the sale of encumbered settled property would be beneficial?—I have long thought that desirable. Under our present system of law it would be especially desirable, because many estates are held by insolvent proprietors.

33,922. Do you not think that Lord Cairns's Act has had a considerable effect in that direction?—I cannot say that I have observed that effect.

33,923. Has not a large extent of settled land been sold under the provisions of that Act?—So far as inquiry leads me to form an opinion upon this subject not many estates have been transferred under that Act, and the greater bulk of the land has passed from one settlement to another.

33,924. There are no official figures upon the subject?—I think there are no figures on the subject.

Operation of the suggested legislation on agriculture.

33,925. Do you consider that the legislation that you have been describing would operate beneficially upon agricultural depression?—Yes, in this way. It would, in the first place, be a great advantage to all existing landowners; it would enable them to obtain a higher value upon the sale of their land; it would give to all classes who were inclined to purchase land thorough confidence in their dealings with it, and the transfer would be less in cost and more prompt in action, and the possession of land by a larger number of persons would bring what, with regard to agriculture, is most desirable—it would bring the effective energy of a very large number of minds to deal with the land for its productive advantage. In this period of depression what we most need is the active interested energy of proprietorship, and that should be given to a much larger area of the agricultural land. Without suggesting that that would be an effective remedy for depression, it does, however, seem to me to be a great advantage in that direction.

Economical position of large and small holders compared.

33,926. As to the breaking up of large estates into smaller ones, we have not yet found from the evidence here that the small landowners or cultivators of the land are in a position of any greater advantage than the larger ones in the present crisis?—If you wish my opinion, I think it would be very difficult to ascertain that, but I suppose it would be admitted that we could produce cases probably in every county in which the smaller cultivator of land had been much more successful than the larger cultivator. That would be my own experience from observation.

33,927. You have not inquired particularly into that point, which is of great importance, of course?—I have noticed the reports from some allotments and some small holdings of the very large crops upon small areas of land such as are not equalled by the cultivation of a larger area. But I am not here to say that all occupations of land should be small. I think many parts of the country are unsuited for it.

33,928. You do not hold the view that the economical position of small holders is any worse than that of large holders?—Certainly I think the small holder is generally better off.

33,929. (*Mr. Lambert.*) In proportion to their means you think that?—In proportion to their means.

Common rights.

33,930. (*Viscount Cobham.*) Are you of opinion that further legislation with regard to commons is desirable, and that popular rights generally, over land and water, require more protection?—I think the general preservation of public rights in common and waste land has been very much greater of late years in the absence of law than it was formerly. I remember very well Mr. Fawcett commented on a Bill that was introduced into the House of Commons in 1871, proposing to enclose 7,000 acres of land, of which, if I remember rightly, six acres were devoted to allotments, and about seven or eight acres to recreation ground. Such a proposal is impossible in the present day, owing to the change of public opinion, but I think it would be desirable in regard to the remnant of common land that some legislation should be proposed.

33,931. Enclosure is not now possible without the consent of Parliament?—I am aware of that.

33,932. In fact the enclosure of commons has practically ceased?—It has practically ceased.

Mr. A. Arnold. 9 Nov. 1894.

33,933. Are you in favour of the enfranchisement of long leaseholds?—I will not refer to the town holdings question, but with regard to agriculture I think it would be certainly desirable that a tenant should have the power, under equitable conditions, of enfranchising long leaseholds. It all tends to give greater security in his occupation.

Enfranchisement of leaseholds.

33,934. Speaking of agricultural land, what do you mean by long leaseholds?—That is the question, what one would mean. Some people have advocated 20 years. That seems to me a short time to obtain compulsory enfranchisement. I would call a long leasehold 50 years.

33,935. Is there such a thing as a 50 years' leasehold held by the cultivating tenant of the soil?—Yes; my memory serves me with instances of the Charity Commissioners having land in the neighbourhood of towns, and small holdings, where the reversion comes to the Charity Commission in about 50 or more years, and I have no doubt that there are very many cases throughout the country. But, however, the opinion of Parliament might vary upon that, and might call it 20 years. I have not been able to accept 20 years as a long leasehold.

33,936. Would not it practically come to this, that landlords would not grant long leases unless they wished to sell?—I have known cases where the Charity Commissioners expressed an opinion that they were entitled to exceptional terms in selling long leaseholds, and were not so anxious, both on public and private grounds, to enfranchise on fair terms.

33,937. You are probably thinking, in connexion with this subject, mainly of public bodies?—I am thinking of public bodies, of course.

Security of tenure.

33,938. Have you any specific recommendations with regard to the amendment of the law of landlord and tenant?—I would only deal with one, and that would be to give the tenant better security in his holding. In one direction especially he ought to have better security against any future rise of rent.

33,939. Is there any particular scheme that has been formulated to which your society have given their approval?—I believe they have generally approved an amendment which I myself introduced into the House of Commons in 1883, when the Agricultural Holdings Act was before Parliament, proposing to omit the words, "On quitting his holding." That would have made the notice of raising rent to the tenant, practically a determination of the tenancy, and would have entitled him to receive any compensation that might be due to him upon the receipt of that notice.

33,940. Sir James Caird suggested something of that kind?—In concert with Sir James Caird I introduced it, but I was largely defeated then.

Land purchase.

33,941. Are there any other means which you wish to suggest for promoting the acquirement of land by the people for residences and cultivation?—I should like to see, under equitable conditions, a system of land purchase established in this country with a larger scope than has hitherto been adopted, and which, while acting something on the system adopted in Ireland, would apply to a holding not exceeding 50*l.* a year.

33,942. Do you think that that would largely operate as respects agricultural land?—I do not think it would at present. But under altered conditions of the law, such as I have previously suggested, there would be, I should hope, a gradual, and in the end, a very signal alteration, in the distribution of land.

Glebe Land Act.

33,943. How does the Glebe Land Act work, in your opinion?—It seemed to me to be the first attempt made in this legislation. I allude particularly to the eighth clause of it to distribute lands of a quasi public character among those who could engage in the operative ownership of the land. But, as the Commission are aware, that has not been the operation of the Act, and although some—probably between 100 and 200—glebe lands have been sold under its operation, not one acre of it has passed under the direction of the eighth clause. I should like to see a very much larger dealing with glebe lands. There was in 1886, I think, a return issued by the House of Commons, showing that the glebe lands of the country amount to about 650,000 acres, and those lands are very widely distributed, perhaps more widely distributed than any other form of public land. The clergy, as shown by the Assistant Commissioners under the Duke of Richmond's Commission, are not generally very good cultivators; indeed the evidence

Mr. A. Arnold.
9 Nov. 1894.

of those practical gentlemen is, that the glebe lands are the worst cultivated lands in the kingdom; and for that and other reasons there could be very little doubt that the clergy would not be unwilling to part with their lands upon equitable conditions, and I think, so far as the interests of the Church are concerned, would be benefited by an exchange of this land for money—Consols. These lands and other lands of a similar public character amount to, altogether, as was shown by the return issued, I think, some 10 years ago—nearly 10 years ago—upon the motion of Mr. Firth, that lands of this character amounted altogether to about 2,000,000 acres. I should like to see those public lands placed by the authority of Parliament at the disposal of the county councils and other local authorities; or, if Parliament in its wisdom thought it would be more operative, then by a special commission. And I should like in that connexion to say that I remember a public Bill dealing with those interests by Lord Randolph Churchill in 1884; it was called the Mortmain Law Amendment Bill. It contained three provisions: (1) Power for persons having the management of lands in mortmain to sell within 10 years; (2) at the end of 10 years, if unsold, the lands to vest in the Land Commissioners for England and the Irish Land Commissioners respectively; and (3) the Land Commissioners for England and Ireland to sell as they shall think fit, with powers of management in the meantime. That shows that such a proposal has some support at least, from both sides of the House of Commons. It does seem to me that no land could be so advantageously and effectively placed at the disposal of local authorities as these public lands. This would involve the least amount of friction and trouble with regard to compulsion; and for these and other reasons, seeing that they are also very available, and that powers of exchange could be given to the local authorities which would enable them, in exchange for the glebe or other public land, to obtain lands perhaps more suitable. I think a very large breadth of land, without creating friction or objection on the part of any one class in the country, might be obtained, and pass gradually into the hands of more productive cultivators.

33,944. Is not it a fact that the Glebe Land Act enables public bodies to deal with the incumbents for the purchase of their glebes?—Yes, but under the existing arrangements that has not proved successful or operative, and I think, as a matter of fact, the glebes sold have generally been annexed to large estates and passed under the disability of Settlement.

Disposal of public lands.

33,945. There is a disinclination on the part of public bodies to make use of their powers then?—I am anxious to prevent and would have strong measures to prevent the passing of public lands into settlement and into large estates. If they are dealt with at all they should be dealt with for the general advantage of the people.

33,946. (*Mr. Little.*) What public bodies are you including in your description?—Colleges, hospitals, corporations, and the Crown, except, of course, as to those lands devoted to Royal dignity, to public recreation, and public offices. When I speak of the Crown lands I mean the agricultural land.

33,947. Would you include the Ecclesiastical Commissioners?—Yes, certainly.

33,948. And all charitable trusts?—And all charitable trusts.

33,949. (*Viscount Cobham.*) You would prevent these public bodies from re-selling their land to private persons?—I think the land should be taken, as Lord Randolph Churchill's Bill proposed it should be taken, by public authorities.

33,950. And retained in their own hands?—And retained in their own hands or disposed of. I think Lord Randolph Churchill suggested the Land Commissioners. I think now we have set up county councils—and district councils—it would not be possible to ignore the local authority; it would be better to deal with them. But the lands which the Honourable Commissioner asked me about are generally set out as amounting to 2,000,000 acres altogether, principally of the best land of the United Kingdom. They are generally set out in the return obtained by Mr. J. B. Firth, the late member for Chelsea.

33,951. Does that include the Crown lands?—Yes, I believe the agricultural lands of the Crown are about 70,000 acres.

33,952. (*Mr. Little.*) And your proposition is that this public authority should have it for the purpose of sale?—For the purpose of sale or acquisition. We propose to promote the acquirement for the people for residence and cultivation. One of my ideas for accomplishing the object of the Free Land League is that these *quasi* public lands should be disposed of in whatever manner the Royal Commission should think best.

Mr. A. Arnold.
9 Nov. 1894.

33,953. (*Viscount Cobham.*) You would allow them to sell the lands for allotments?—Certainly.

33,954. (*Mr. Lambert.*) To prevent their being sold into settled estates, I understand?—That would not meet the object if they were to let these glebe lands go to settled estates.

Allotments and Small Holdings Act.

33,955. (*Viscount Cobham.*) Have you anything else to say before the examination in chief is closed?—I want to say a word or two about the Allotments Act. Recent legislation connected with the land by the Allotments Act and Small Holdings Act appear generally to our society to be extremely valuable and useful, but the results are comparatively insignificant. Supposing, for example, that in a few years past the total number of allotments given by landowners and provided by public authorities amount altogether to say 100,000, and the average size of these allotments is 20 perches or the eighth of an acre. I think an average of that sort would show in five or six years about 12,500 acres. The operation of these Acts is insignificant, and under the system, although they have been extremely useful and are very useful to the class of agricultural labourers as they have no other means of obtaining footing on the first step of the ladder, I think they are insufficient as a general result. What we look forward to is a much wider extent of distribution of land by material alteration of the Land Acts, and that a very much larger breadth should pass into the hands of possessing cultivators.

33,956. How much land is held in allotments?—I have no sources of information beyond those open to every member of the Commission in the returns. But judging from the published returns I suppose we might assume that 100,000—that there was an increase in a recent number of years of 100,000 allotments, which at one-eighth to the acre would give 12,500 acres of land. Unfortunately in the returns of allotments there is a grave omission. There should be an attempt to report, if I may make the suggestion to the Department of Agriculture of the extent of land so devoted. They generally give the numerical amount but not the estimated area.

33,957–8. (*Mr. Dalton.*) And that was an increase—not a total number?—That was an increase.

33,959. An increase of 12,500 acres?—An increase.

33,960. (*Viscount Cobham.*) Are you satisfied with the operation of the Small Holdings Act?—I think that any operation that it has had or will have will be comparatively insignificant. I do not believe that it will or can operate to effect any sufficient or even very considerable change in the distribution of land.

33,961. That no Act drawn upon these lines will succeed?—No Act drawn upon these lines can possibly succeed in effecting a very large material change in the distribution of land.

33,962. The object of the Act might be better carried out by the other measures which you suggest?—To a very much larger extent, but for any material change such as exists in other countries and such as should exist we must look to legislation of a more general character.

Mortgages on agricultural land.

33,963. (*Lord Rendel.*) Have you formed any conception of the extent of the agricultural land generally which is now burdened by mortgage?—Arguing from the evidence given by Mr. Hussey in Ireland, and by persons, solicitors in England of the highest experience and competence, who affirmed that land was as heavily mortgaged in England as it was in Ireland—I think I recall the name of Mr. Frere of Lincoln's Inn, who gave evidence to that effect, and from my enquiry and experience which has been rather long and perhaps somewhat wide I have been led to form the same opinion that land is as heavily charged in all ways in England as it is in Ireland, and I think probably that the encumbrances of land in England amounts to half the National Debt say four hundred millions sterling.

33,964. Do you so far as the condition of agriculture is concerned and so far as you feel able or competent to speak on the question of agricultural prosperity consider that this condition of burden is an element of very

Mr. A. Arnold.
9 Nov. 1894.

great disadvantage?—If it lead, as under freedom of land it would lead, to the rapid sale and interchange of ownership of the land, then I think it would have comparatively fewer evils; but under the present system here is a maximum of evil arising from it, because the land is in a fettered condition, and although heavily encumbered with debt, it remains in fettered condition.

33,965. Do you happen to have made yourself acquainted with the extent to which investors of mortgages in land have found themselves in recent years compelled to become unwilling owners of land?—I have heard of cases of the sort through the depreciation in value of land.

33,966. You have formed no opinion as to the extent?—There are no figures that I know of available.

Registration of title.

33,967. Would a system of registration involve as of necessity the declaration of all burdens on land?—Not of necessity. The best system would certainly involve the exhibition of them to those who had access to the register upon the payment of necessary fees for the examination of the register.

33,968. Would it be in your view of any importance in order to define the position of land that registration should lead or tend to the record of mortgages on land?—Yes, I think so, because it would render a mortgage so much more advantageous to the owner. For example, if an owner has obtained a sum on his estate and there is need for a further sum, under the existing law he is obliged to pay a heavier interest on the second mortgage, but if the system of registration were carried out the security of the second mortgage would be as good as the first mortgage, provided there was sufficient margin. That is not the case now, and a second mortgagee may be tacked out of his security altogether.

Record of mortgage.

33,969. In those countries where registration prevails are you aware whether the record of mortgage is universal?—Yes. The record of mortgage is universal. The record of charge is universally inscribed.

33,970. And practically compulsory for the purpose of giving value to the mortgage?—Yes, but owing to the existence of the system, mortgages of even 5*l.* are not unknown in German experience because the fees are so small that the small proprietor can obtain a loan without an expense which is prohibitory.

33,971. Then would you attach importance to the registration as leading to the revelation of the true state of the ownership of the land?—I think that the public interests in land should rule first of all, and that those public interests demand that such a system should be established. It is of great advantage, and it would be of pecuniary benefit to the owner as well as of advantage to the State.

33,972. Assuming our present landlord and tenant system of agriculture you regard this clearing of the financial position of the landowner as important for the success of agriculture?—Well, it would immediately lead or very shortly lead to the extinction of insolvent landowners, and that would be an evident advantage to agriculture because if land passed into the hands of or was generally held by persons well able to supply the capital for its cultivation such form of ownership might produce the very greatest benefit.

Amount of mortgages.

33,973. So far as what may be called the waterlogged condition of very large areas of agricultural land is concerned, we have at present no means of making any useful inquiry?—I know of none.

33,974. And to the extent to which this waterlogged condition is injurious to the agricultural prosperity of this country this Commission has no power of effective intervention, would that be your own view?—I am unable to define the powers of the Commission. I know of no figures that I could place at the disposal of the Commission to show that waterlogged condition.

Effect of registration of title.

33,975. Do I gather from you that in suggesting registration of title which would involve a revelation of burdens on the land, you are making a recommendation of your own view of primary importance in reference to the agricultural prosperity of the country?—Yes, I think that the system in the changes I have advocated would be of great advantage to the agricultural prosperity of the country, because it would facilitate the passing of land into more favourable hands than those by which it is sometimes held. When you speak of the exhibition of encumbrances that would not be of a public character; that would be upon the books of the Department, and certainly would be no more public than the registration of bills of sale at present. There must be an active inquiry on the part of any one who wished to obtain information upon the subject.

Mr. A. Arnold.
9 Nov. 1894.

33,976. I suppose that at the worst there would be no more public exhibition than the debentures or the debenture mortgages of joint stock enterprise?—Nor the funds in the bank of England.

Transfer of land.

33,977. It seems that the largest measure that you had in view for facilitating transfers of land was that of rendering available for sale something like two millions of land which you described as at present *quasi* public?—It is so.

33,978. Your proposition is simply to render this land saleable, do I understand that to be so?—To place it by the authority of Parliament at the disposal of the local authorities, or if you should find the operation more expeditious by a Land Commission, and that either by sale or by any other form of tenure the local authority should be empowered to deal with them upon equitable terms to those who now have a beneficial interest in them.

Local authorities and transfer of land.

33,979. Then you regard the present creation of representative local authorities as furnishing a convenient channel for the greater sub-division of this large body of land?—Certainly.

33,980. And you think that Parliament might reasonably be called upon to give considerable latitude of power to the local bodies in dealing with this land?—Certainly.

33,981. And that the transfer should be from the present holders to the local body as one which is desirable in the general interest and could have no individual interest?—Certainly.

33,982. Have you considered the position of the two million acres of land as at present held from the point of view of agricultural advantage?—Yes.

33,983. Is it of advantage that that land should not have a direct individual and present owner?—No, that is one of the great disabilities, the owners are generally absentee; in fact almost in all cases absentee, and there is not that effective management of the land which obtains on the best private estates.

Limited owners.

33,984. Your view being that what is wanted in the interests of agriculture is what is called "the master's eye"?—Especially in the case of the clergy, who are limited owners in the worst degree, because they have no knowledge of or special interest in their successors.

33,985. And their own position is one which is hard upon themselves, I presume, as being essentialy limited owners?—Limited owners with practically no real interest in or knowledge of their successors.

33,986. And with another public duty to discharge not consistent with the guardianship of agricultural land?—Yes, and without any education in the management of land.

33,987. And no interest in their successors?—And no interest in their successors.

33,988. And no adequate means to meet changes arising under the circumstances of devolution of the land?—That is so.

Disposal of public lands.

33,989. But returning to the present tenure of the two millions of acres of land that is much more disadvantageous in your view from being held by trusts essentially than it would be if in the hands of the great landowning class in the country?—Certainly, and the expenses of management are very much greater.

33,990. And "the master's eye" still further removed?—Certainly.

33,991. Then you press with great confidence the consideration of this release of the two million acres of land for the purposes which you have generally set forth?—I do.

Settled Land Act.

33,992. You referred I think to Lord Cairns's Act. Have you any direct knowledge of the working of the Settled Land Act of 1882?—I believe there are no figures extant by which we can observe the operation of that Act. So far as inquiry has led me to form an opinion, I have formed the opinion that it has not tended widely to the distribution of land, and that the greater breadth of land has passed from one settlement to another.

33,993. That operates, I presume, universally by the transfer from private persons to private persons?—Yes, but the expense and delay in obtaining the prescribed

Mr. A. Arnold.
9 Nov. 1894.

sanction to projected improvements are calculated rather to hinder than to encourage, I am now speaking of the Settled Land Act, I believe that even at present a limited owner cannot in consideration of a rentcharge or of purchase money payable by instalments effect improvements. I think there is no power under the Act to rebuild or to improve existing buildings or for other agricultural purposes, and consequently the tenant for life of freehold houses, shops, and warehouses cannot expend capital money in improving. Under any possible improvement of that Act the difficulty of the forms of application and the delays attending it will always be considerable, and what I wish to press upon the Commission is that if I have correctly stated it that probably 52,000,000 acres in the United Kingdom are in settlement and that that enormous extent of land is all subject to this disability that a man cannot spend the proceeds of the sale for his own advantage, and, therefore, he has not the interest with respect to any acre of those 52,000,000 acres of an ordinary holder of free land.

33,994. So far as it takes effect by the conversion of any settled land into another form of property this operates?—This operates.

33,995. And widely operative?—I do not think widely operative.

33,996. They are substantially operative?—I understand you to say widely operative.

33,997. Yes?—I do not know that it is operative; my opinion is that it is not.

33,998. Well substantially operative?—The law is in operation and no doubt there are cases occurring frequently of dealings under it.

33,999. Invariably it is a sale by private persons to private persons?—Yes, as a rule, certainly.

34,000. Under very serious conditions for the protecting of interests of future owners?—Under embarrassing and very costly conditions.

34,001. And under conditions leading sometimes to collusion?—That would be possible. I will not impute that when I have no knowledge on the subject.

34,002. But there could be no knowledge aye or no, except the good faith of the party?—Just so.

34,003. No difficulty of that kind would occur under the sales by public bodies?—The sale by public authority or public supervision either of the Land Commission or local authority I think would preclude any such thing.

34,004. And in the sale of 2,000,000 of acres of trust land to public bodies there would be no such embarrassment as would occur under Lord Cairns's Land Act?—Certainly not.

34,005. (*Mr. Everett.*) Generally you would wish to have every acre of land saleable at the will of the responsible owner?—I think that may be described as the existing law—it is saleable. But I should like it to be saleable for the absolute advantage of the holder; that is to say to have free land, and by that I mean that if a man sells an acre of land he is able to dispose of the whole of the proceeds; that is a condition which does not obtain on 52,000,000 acres in the United Kingdom.

Private and public ownership.

34,006. You prefer private ownership to public ownership; that is worth consideration when dealing with the 2,000,000 acres of semi-public land which you think it would be an advantage should pass into the hands of private owners?—I think that public ownership on a very large scale would not be desirable, and would not lead to very good results.

34,007. You have a good deal of knowledge of commons, I think. Do you happen to know whether there are any commons which you call free commons in respect of which no lord of the manor can claim that they are waste of his manor?—I was much concerned in the enclosure of commons 40 years ago, but I cannot speak now of any particular common.

Large and small estates compared.

34,008. (*Captain Owen Thomas.*) Are you of opinion that the breaking up of large settled estates would be beneficial to the farmers generally?—Especially where they are held by insolvent owners.

34,009. Is it not a fact that farmers prefer to be on large estates?—I think so generally.

34,010. Have you compared the rents charged per acre by large owners with small ones?—I think their rents are generally lower on the larger estates, but I have no objection to a rent that will obtain the greatest possible energy from the producer.

34,011. (*Mr. Lambert.*) You said that 400,000,000*l.* sterling in your judgment was the amount to which land was encumbered?—I formed that opinion from taking Mr. Hussey's figures in Ireland, and the statement made by Mr. Frere and other eminent solicitors, that the condition of encumbrances in England was not less than in Ireland, and, taking that basis, it would show that land was embarrassed to that extent.

Mr. A. Arnold.
9 Nov. 1894.

Amount of mortgages on land.

34,012. What would you put the total value of the land so embarrassed at?—That I cannot say at present; I do not know.

34,013. Why, in your opinion, is the Land Transfer Act of 1875 a dead letter, or, as it has been stated, a dead letter?—Well, it was found to be so because there was no compulsion in that Act, and therefore really no sufficient reason for inducing the proprietor of the land to carry it to the registrar.

Land Transfer Act.

34,014. Do you think in any successful Land Transfer Bill, to accomplish the objects that they have in view, the element of compulsion is necessary?—Undoubtedly in order to obtain a sufficient bulk of registration to make it valuable.

34,015. You expressed the opinion that farmers generally prefer to hold land under a large owner than they do under a small owner?—Yes, as a rule I think if you were to ask farmers who are engaged on farms on some of the largest and best estates in England you would find that they prefer their present owner partly because to a much greater extent they lean upon the probability of obtaining reductions of their rent in bad seasons, and they believe that on large estates they are better secured, as a rule, against a rise of rent in very good seasons. But I should like to see farmers much more largely cultivating their own land.

Large and small estates compared.

34,016. (*Mr. Dalton.*) You would abolish the settlement of land altogether?—I would abolish the power in reference to life estates in land.

Abolition of settlement of land.

34,017. Do you include house property?—Although not concerned with that I should include all forms of real property.

34,018. It would be a very severe restriction?—It would be a very severe restriction but it would not apply to charges on land.

34,019. You would not think it right to apply any similar rule to the settlement of personalty?—I am not concerned with personalty to-day.

34,020. But your proposal would compel a man who wished to make a provision for those who come after him to invest all his property in personalty if he wished to settle it?—Or to make a charge in the form of personalty.

34,021. He might create a perpetual charge upon it?—I hope the law would prevent him doing anything perpetual. He might make such a charge if the law permitted it.

34,022. The result would be of course to throw an immense quantity of large estates into the market?—Would it?

34,023. Would it not? These 750 gentlemen who hold one third of England, if they wished to provide for those who come after them, if they desired to settle their property, they would have to convert it into personalty?—I see no obligation to do so.

34,024. How otherwise could they settle their property if they wished to provide for their children?—If they had sufficient means to keep their estates in their own hands, and liked to settle a charge by way of rentcharge on the estate, I see nothing in the law to prevent them.

34,025. But is not the object of the League to throw a considerable part of it on the market?—I believe that a much wider distribution of land would be beneficial, but I am not aware that the result of that change would be to throw large estates upon the market, not an amount to make it disastrous.

34,026. I am not suggesting a disastrous effect; the object is to get a considerable amount of land, we will say, offered for sale instead of allowing it to remain in a small number of hands as at present?—No, the first object is to have the fullest interest on the part of the proprietor; we want the proprietor to have the largest beneficial interest in the land.

34,027. You would not touch existing settlements, I presume?—The wisdom of Parliament would deal with that point.

Mr. A. Arnold.
9 Nov. 1894.

34,028. Is there any suggestion of touching existing settlements?—Under certain conditions I think it might be desirable.

34,029. What kind of conditions?—Such conditions as seem equitable to Parliament, the same sort of conditions that have led Parliament to deal with for example, leases in Ireland.

34,030. But settlements are not contracts?—Settlements are not contracts, but it may be said that a settlement conveys a contract.

34,031. What is the consideration for then? I do not think they are contracts?—I will take your opinion upon it.

Compulsory enfranchisement of copyholds.

34,032. There was one other matter, with regard to copyholds, I wish to ask a question about. I do not quite understand what is proposed. Is it proposed that the copyholder should be forced to pay for the enfranchisement of his copyhold within a limited period?—I adopted Sir James Caird's proposal which was that in a certain period all copyholds should become freeholds, Sir James Caird suggested 30 years, I suggest five.

34,033. But in what way are they to become freeholds?—By the power of enfranchisement ceasing by law. There are now powers of enfranchisement, and they would cease by law.

34,034. Is the copyholder to get his land into freehold without paying for it?—No. During the passing of that period I presume the tenant would obtain his enfranchisement with equitable payment for it.

34,035. Then it would come to this that a copyholder would be compelled, whether he wished to provide the money or not, to pay the lord of the manor for the enfranchisement, and it might be a considerable amount in certain cases?—I do not say that that would absolutely follow; it might follow if he remained in possession of the land, but even in that case it would not absolutely follow; there might be some other arrangement.

34,036. I do not quite understand what the arrangement would be, if the copyholder is not to pay what he would now have to pay if he wished enfranchisement. Is he to get the enfranchisement without paying to the lord of the manor?—If he wished enfranchisement and desired to become a freeholder he would have to pay the lord an equitable sum for the enfranchisement.

34,037. Supposing he wished to remain a copyholder, he would be compelled to buy the enfranchisement?—If he wished to become a freeholder, he would be compelled to buy it.

34,038. But if he did not buy what would happen?—What would happen if the landlord did not sell—it would become a freehold, but the law would facilitate and enable the lord to obtain either his land or the equitable payment for enfranchisement.

34,039. (*Viscount Cobham.*) The suggested procedure was that after the next surrender no further fines should be payable. The initiation of the enfranchisement would be thus thrown upon the lord?—Quite so.

34,040. (*Mr. Dalton.*) Then the lord of the manor would lose his fines?—That surely was not Sir James Caird's opinion.

34,041. I was trying to find out how it would work and I do not quite understand it now. Then with regard to sales; there were to be no sales with an imperfect title?—The amendment of the law that I should propose and hope to see effected would practically avoid that difficulty. I mean in a case where a man has been in undisputed possession for 10 years and can give *primâ facie* evidence that it had a legal commencement. I never heard a lawyer say that there would be any insuperable difficulty with regard to imperfect title under those conditions. It is owing to the present limitations of the law that imperfections in title arise.

Abolition of settlement and entail.

34,042. (*Mr. Chaplin.*) With regard to the existing settlements, you contemplate, I think, that settlement might be interfered with on terms which would appear equitable to Parliament?—Yes.

34,043. In the same way, I think you said, that Parliament had already interfered with existing contracts?—I mentioned a notable instance, very familiar to yourself, of Irish leases.

34,044. Did I understand that you seem to think that settlements were the same things as contracts?—Not the same thing as leases; but I suggest that that matter should be left open to the judgment of Parliament. I have no particular view to set before the Commission.

Mr. A. Arnold.
9 Nov. 1894.

34,045. Your position is this, that you think it very desirable in the general interest that the person in possession of all the land, or any of the land, of the country, should be its absolute owner?—So far as practicable.

34,046. Then you pointed out that there were 50,000,000 acres of land already, which was not in this position?—That is probable, from the return I have quoted.

34,047. How do you propose to deal with that 50,000,000 acres of land, so as to accomplish your object?—By the abolition of settlement and of entail.

34,048. You do not propose to extend that to existing settlements?—That is an open question.

34,049. But it is the crux of the question?—Then the conclusion of it is not in my hands. I think that settlements might be interfered with, but I have said already that I have no precise view to suggest to the Commission with regard to interference with existing settlements.

34,050. Of course you see the difficulties?—I see the great difficulties.

34,051. And you have given great attention to them?—I have given great attention to them, and I should hope that in the end public interest would prevail, having due and proper regard to private interests.

34,052. Then I understand your position to be this, that having given, as we all know, very long and very close and careful attention to this question, you are not prepared to make any suggestion whatever to the Commission for dealing with what you call the great difficulty of existing settlements. You have no proposals to make?—That is so. But at the same time I do make a very responsible suggestion that the obligation of those settlements should be open to Parliament.

34,053. But you cannot suggest for the guidance of this Commission or for Parliament, in spite of the study you have given it, any equitable mode which might be adopted?—I am not prepared to do so at the present time.

Operation of the Small Holdings Act and the Parish Councils Bill.

34,054. Have you paid such attention to the Small Holdings Act as to enable you to say that the operations have been small or otherwise?—Not minutely. But my opinion would be that it has been small.

34,055. I suppose, as a matter of fact, that there was scarcely time for the operation of that Act to be thoroughly tested before the passing of the Parish Councils Bill last year?—That would be my opinion.

34,056. Would the tendency of the Parish Councils Bill be, in your opinion, altogether to override that Act?—To enlarge its operation, to a certain extent—to override the Act perhaps technically, but with regard to its objects perhaps to enlarge the scope.

34,057. Yes, to enlarge the scope of the Act on that Bill; but as far as the operation of the Bill was concerned it would practically render it nugatory?—I would scarcely say that. I say that the objects of the Small Holdings Act would be probably enlarged and promoted by the Parish Councils Act.

34,058. I put the question in another way. Do you think or not it is at all probable that the two Bills would operate side by side?—I think that will be so.

34,059. You think that both of them will operate?—Both of them will operate to a certain extent, but to an insignificant degree as compared with that which I desire to see accomplished by larger and wider changes in the law.

34,060. I understand that. I know you have considered these subjects very carefully, and I wanted to arrive at your opinion for our guidance as to what would be the effect of the Parish Councils Act on the operation of the Bill which passed before it?—I should think the effect would be to promote and enlarge its operation.

34,061. You think that the passing of the Parish Councils Bill, so far as you can judge, would promote the operation of the Bill?—By enabling the local authorities interested to deal with the possession and acquirement and leasing of land.

34,062. But what I want to be clear about is this, will the acquisition of land be promoted by the passing of the Parish Councils Bill under the machinery and

Mr. A. Arnold.
9 Nov. 1894.

operation of the Small Holdings Act, or under the machinery and operation of their own Act; and if it is under the machinery and operation of their own Act will not that practically render useless the Act which was passed before?—I should think not so, for as the Small Holdings Act may be beneficial—if it has any beneficial operation—it may be enlarged.

Modern Doomsday Book.

34,063. (*Mr. Little.*) You commenced by giving us some particulars about the accumulation of land in a few hands, and you derived your figures from the modern Doomsday Book?—Yes.

34,064. Have you any idea as to how that book was compiled?—Not beyond the preface, and my rather intimate acquaintance with Sir John Lambert, who was, I believe, the controlling official.

34,065. It was compiled, was it not, from the returns of clerks to boards of guardians and clerks of Assessment Committees?—Yes.

34,066. And through parish officials?—Yes.

34,067. And do you know whether there is in existence any register of owners from which such returns can be compiled with anything like accuracy?—I do not think there is, but I think substantial and valuable facts, such as I have laid before the Commission, may be obtained from that return.

34,068. But supposing the return is based upon evidence which is bad the value of it is considerably weakened?—Well, land is frequently returned as parish land whether it may belong to a rector or vicar.

34,069. I was not speaking of settled estates; but if there is no list of owners, no register, and no one who has any object in inquiring who is the owner of a particular property, it seems to follow that there can be no correct returns?—It is in consequence of the defective condition of English law that the information is so difficult to obtain.

34,070. Neither the authority that assesses nor that which collects taxes or rates has any relation whatever with the owner—is not that the case?—That is so.

34,071. And though there is a column in the Poor Rate assessment for the name of the owner there is no guarantee that the name inserted is a correct statement?—Certainly not.

Accumulation of land in large estates.

34,072. You view the accumulation of estates as being injurious to agriculture?—This accumulation of land in large estates is injurious to agriculture.

34,073. And that view is not affected by your own admission that tenants prefer to live on large estates?—I am sorry to say that a condition of dependence is very general in the agricultural districts, and one of the evils of that condition always is that those who endure it are more or less too easily satisfied.

Cultivation of land on large and small holdings compared.

34,074. But if it were shown that the land on large estates is on the average as well if not better cultivated than on small estates, would it still be your opinion that the accumulation of land was injurious to agriculture?—Yes, if I wanted to show a large breadth of land which was the best cultivated I should probably go to some large estate owned by a member of the House of Lords or the House of Commons, but if I wanted the largest crop in the United Kingdom I should go to some small estate where it was personally cultivated by the man's own hands.

34,075. When you say a small estate cultivated by a man's own hands, what do you mean?—There was evidence given before the Duke of Richmond's Commission. There was one man, a peasant proprietor of two acres whose evidence was given; and there was no large proprietor produced anything like the same result. This man said, "I have two acres of land. In 1869 I "had 45 bushels of wheat, 62 lbs. to the bushel on one "acre after deducting 2 lbs. for sparrows; 1870, 57½ "bushels on 1¼ acres."

34,076. You think that that is not done anywhere else?—Not over any large breadth of the country; it is done on a field here and there.

34,077. Would you say that the average results of small holdings or small farms are better than the average results on large farms and large holdings taking the same kind of land?—I would not say so. Small proprietorship has not had a fair opportunity either in regard to markets or roads or railways or distribution of produce.

34,078. Take a small holding and a large holding under similar conditions as to land and as to disposing of the produce, would your opinion still be that the produce of the small holdings would be larger than that on the great holdings?—In every county in England and in every country of the world the largest production that you can exhibit is always found on a small holding.

34,079. But irrespective of the nature of the holding?—Irrespective of the nature of the holding, irrespective of nothing. But merely proving that where a man's total energies are given to the cultivation of his own land he therefore produces the results better than under any other condition.

34,080. But supposing that the small holdings that succeed were of more than a fair quality, is it fair to put their produce on the same level as that of large farms?—That would not be done. There are, undoubtedly, vast tracts of land in the East of England that are very unsuited to small holdings.

34,081. You still are of opinion that other things being equal the average produce of small holdings is greater than that on the large holdings?—I say that it can be so. It is a well-known fact that the owner gives greater energy and greater share of his personality in the production.

34,082. It must be to some extent a matter of opinion, it is not capable of proof, is it?—Do you find farmers producing 57½ bushels of wheat to the acre? Take the crops on allotments in different parts of the country; do you find the farmers producing the same?

34,083. Your object, I understand, is to create occupying owners?—To create a more direct interest on the part of all parties in the useful cultivation of the soil.

34,084. You desire to see a larger number of people occupying their own land?—Yes; and landlords, and especially the largest, enjoying a fuller proprietorship.

34,085. But I am now on the question of the large and small farms and occupying owners and tenants. I understood you to say that you desired to see a much larger number occupying their own land?—Yes; and a wider distribution of land.

Encumbrances of small owners.

34,086. You have spoken of the encumbrances on land; are you at all acquainted with the encumbrances of small owners?—Not specifically.

34,087. Are they not equally and as heavily encumbered as those of large properties?—I should think so. But there is this great advantage that when the encumbrances become intolerable they pass away because, as a rule, they are not settled property.

34,088. Are you aware that there are at present hundreds of small holders very heavily encumbered, and who pay as interest on mortgages much more than they would pay as rent, that the mortgagees are afraid to take the land, and the farmer goes on year after year getting deeper and deeper in debt?—I should think no law has considered the advantage of small proprietors.

34,089. We have it in evidence before us that that is the state of affairs in the Isle of Axholme?—That case has always come before us on every Commission.

Disabilities of glebe owners and public bodies.

34,090. You spoke of the disabilities of glebe owners and the other public bodies. You spoke of putting them on the same level as others; having described the difficulties of clergymen as owners are we to suppose the disabilities are the same?—Not the same in degree, but there are difficulties in every case.

34,091. In respect of non-residence?—That of non-residence and that of more expensive management.

Management of college and other estates.

34,092. Is it a fact that the college estates, and the estates of the Ecclesiastical Commissioners, and the Crown estates, are more expensively managed than private owners?—I do not think it would be denied that the expense for the management of the very best estates of the Crown is larger than for the management of private estates.

34,093. You mean the actual expenses of management are more?—The actual expense of management is larger than the average on private estates.

34,094. Are you acquainted with any of those properties, such as college properties?—Rather extensively, yes. It has been for the last 40 years a matter of interest with me, and I have been very much over England.

34,095. Do you think that generally they are worse managed than other large estates?—I would say as a

rule not so well as some of the best managed private estates. There are estates in the hands of insolvent owners that are abominably and wastefully managed estates.

34,096. Is that very general?—It is much too general.

34,097. Is it not the case that there may be an insolvent owner and a well kept up estate?—I cannot say, and I speak with rather a wide knowledge.

34,098. I would say, a very poor owner, and a well-kept estate?—There are very poor owners who have a very strong sense of duty as regards their estates.

34,099. And very strong trustees, who insist upon keeping the estates up well?—But as a rule you may tell insolvent estates by the condition of them.

34,100. Are there many of them?—Yes, a great number.

34,101. Of large estates?—Of large estates frequently insolvent.

34,102. You have seen their condition?—Yes, I have seen them.

Disposal of public lands.

34,103. Then you would place the lands belonging to public authorities at the disposal of local authorities. I presume you would not appropriate the property?—Not without an equitable compensation.

34,104. You would give it to the local authorities on trust?—By the authority of Parliament. The local authorities might retain it absolutely for dealing with as they saw fit.

Number of allotments.

34,105. Only one other question and that is as to the number of allotments. You are aware that all the returns issued have only given allotments under one acre. Are you not aware that many allotments are of the extent of one acre?—Not so many as I could wish.

34,106. But the return is defective?—I am not pretending to say that that return is exhaustive, but it did exhibit an increase of 100,000, and even double that at 12,500 acres would amount to a mere insignificant fraction.

34,107. But if you included a great number of one-acre allotments, now omitted, you would largely increase that amount?—I put it that the total amount of land devoted to allotments is practically insignificant, and yet that such land is more usefully devoted than any other land in the kingdom.

34,108. Probably the return is very defective?—I should not like to say that.

34,109. It represents the number as considerably less than it is in fact?—You would have great authority with the Board of Agriculture, and I think that you should endeavour to get a return of the area as well as the number of allotments.

Modern Doomsday Book.

34,110. (*Mr. Giffen.*) You admit, in reply to Mr. Little, that the return of the owners of land, from which you derive some of your figures, was made by people who had no interest in the truth of the statements as to who the owners were?—That must be so.

34,111. Is it not the case that for statistical purposes a report may be quite trustworthy, although the people who supply it have no particular interest in the truth of the statements provided that they have no interest in making false statements?—Undoubtedly. But the conditions of ownership in England under the existing law are so intricate that difficulty would apply.

34,112. The effect would be then that, although there might be great errors in individual cases, and that it might not be trustworthy for small areas, yet, for the general purposes of the statement which you have made, the return might be correct enough?—I see no reason whatever that they should not be accurate for the purposes for which I have laid them before the Commission.

34,113. But still your return is, strictly speaking, a return of separate titles, and not a return of the number of persons interested in the land; would not that be so?—Yes, that would be so, to some extent.

34,114. A statement would be made that so and so is the owner of this particular bit of land. I say the man who makes the statement has no knowledge of the intricacies of the title or of the different people that might be interested in the possession of the land?—That would be so; it would be substantially a record of the titles.

34,115. So that in your observation, when you speak of so many owners of land, you mean so many different titles to the land, and you do not strictly speak of the number of persons whatever—that is not the point?—No; I gave the example of four persons as appearing in that return as 44 persons.

Mr. A. Arnold. 9 Nov. 1894.

34,116. Still the number of separate titles would be pretty nearly what you have told us?—Certainly.

34,117. I did not quite understand whether you would admit trustees under a settlement to hold land for the purposes of the settlement, but as absolute owners on the face of the title, and without any declaration of the trust. Is that the state of things to which you wish to arrive?—If settlements were abolished there would be no such cases, but while settlements endure, I see no difficulty in the trustees being registered as owners.

Abolition of settlements of land.

34,118. But you wish to abolish settlements?—Settlements of life estates in land altogether.

34,119. Would that apply to other property?—To all real property, certainly.

34,120. Would it apply to shares in railways; would you call that real property?—I have nothing to do with this to-day.

34,121. Would it apply to leasehold interests in houses?—No, the leasehold interests are personal property and it would not apply.

34,122. Is not that an arbitrary distinction, following the arbitrary distinction between realty and personalty, and not an economic distinction?—It is an economic distinction, because the land is a limited quantity, and all that we desire to deal with is the operation in that limited quantity of land. The leasehold interest is a mere interest, and has no geographical concern equivalent to the possession of land.

34,123. But the distinction you gave was not between land and agricultural land, but between real and personal property?—Yes.

34,124. Is there not a large amount of property which is sometimes real and sometimes personal according to the difference whether it is made leasehold or not?—But our aim would be to obtain as nearly as possible one tenure of land which should be freehold, so far as we can, by the enfranchisement of other interests.

34,125. You only propose to apply this to land?—I would apply this to land.

34,126. You do not propose to abolish settlement as regards personal property?—Certainly not.

34,127. Although property may be sometimes personal and sometimes real according to an accident?—We do not propose to carry this to personal property, only to land.

34,128. Not to all real property?—Well, you mean real property, a life interest, you call that real property?

34,129. I mean you have real property in houses as well as in land?—I would apply it to all land, and all land covered with houses, as well as land covered with crops.

34,130. But not covered with houses where it is leasehold?—Yes, I would apply it to possession of these lands certainly.

34,131. You wish to abolish settlements altogether; you do not contemplate a position of things in which trustees under settlements would appear on the title as the absolute owners without a declaration of the title?—We might have for a period to tolerate that system, but ultimately I should hope that it would disappear. I should be sorry to see registration of title hindered by that question. There is no reason why we should not have a thoroughly efficient registration of title. The trustee system might endure for a time, but I hope that that would disappear.

34,132. You wish to abolish the system of settlement altogether?—Yes.

34,133. To interfere with the private disposition of people who make those settlements?—I wish to say in the case of trustees of leasehold estates, that there could be no great difficulty as to the registration. Supposing we had abolished land settlements and the freehold is registered, and on that property a long lease is made and established, and is personal property, there can be no objection to that, or to the registration of the trustees, as interested in the lease. It would not necessarily involve the abolition of the settlement.

Mr. A. Arnold.

9 Nov. 1894.

34,134. I merely wish to get at what you propose to do, and I think now I understand a little better?—There can be no objection to the registration of an interest by trustees in personal property or in rentcharge on land that would be registerable.

34,135. But without a declaration of the trust on the title they would be registered as absolute owners?—They would be registered as owners without succession.

Imposition of charges on land.

34,136. Then with reference to the making of charges on land of that kind, even if they are not perpetual, you still have them for a very long period. Have you considered the objections to making such charges?—I think such charges might continue. I see no reason why they should not. It would lessen the difficulty of passing such a law if every facility were given to the registration of such charges.

34,137. Is not one of the difficulties connected with the ownership of land which have appeared in recent years this very thing, that the nominal owner of land is given a rentcharge, and he has no real interest in the property at all?—That is the case.

34,138. And those rentcharges although when given, although they may be moderate in appearance and leave a considerable margin to the owner, yet as times change and the owner becomes insolvent as far as that property is concerned it creates a difficulty?—And under the system of the Free Land League he would disappear, and now he is retained.

34,139. What do you propose as to these charges?—I do not object to the proposal that any owner of land should have the power of imposing charges upon the land, and those would be registerable; but the land in which the people have an undivided interest, because "land is a kind of property, as Mr. Lowe said, in which "the public must have a kind of dormant joint interest "with the proprietor," is another matter.

34,140. But would not the effect be to restore the state of things that you wish to be abolished; that the land should be nominally held by one person, and really held by other people?—If we had a system of true ownership and a man became insolvent, it would pass from him.

Mr. A. Arnold.

9 Nov. 1894.

Disposal of public lands.

34,141. What is the equivalent that colleges and institutions of that kind would receive if they should be compelled to dispose of their own property to public bodies—a valuation?—Yes.

34,142. And the kind of property that they would have to invest in would have to be defined?—I think that would be desirable, they are trustees for public interests, but that is not a part of my concern.

34,143. (*Sir Nigel Kingscote.*) You think that these large estates ought to be sold and broken up into smaller holdings. Do you think that purchasers enough can be found with money of their own to pay for their purchases?—No, I do not. I think that the first necessity for a limited owner is that he should be placed in a position so to deal with them. I do not contemplate breaking up or disposing of the large estates.

34,144. But for any estate broken up money must be given?—Yes.

34,145. What I want to ask you is, whether you think there are purchasers enough for those estates with money of their own to purchase them?—Some estates, especially in the hands of insolvent proprietors, would undoubtedly go into the market, and if the law were so improved that men were encouraged to undertake dealings in land, I should hope that there would be, perhaps, not a sale of the whole but a steady sale of land.

34,146. But with regard to the purchasers of these lands. Supposing they had to borrow money to purchase this land, would they be in a better position in having to pay interest and pay off their charge than they would be in renting the land?—If they were assisted after the manner of the Irish Land Purchase Act (and I would be willing to assist them up to 50*l.* a year) they would be in a better position.

34,147. And you would give facilities for borrowing the money for those holdings?—Certainly, up to 50*l.* a year.

The witness withdrew.

Mr. J. F. Moulton, Q.C., M.P.

Mr. John Fletcher Moulton, Q.C., M.P., called and examined.

Mr. J. F. Moulton, Q.C., M.P.

34,148. (*Chairman.*) You are a Member of the Bar, and a Queen's Counsel?—Yes.

Land reform.

34,149. You have for many years past given your attention to the question of land reform, have you not?—Yes, I have.

34,150. Have you considered it especially with reference to agricultural depression?—No; but I have considered it generally with regard to what is the most likely method of giving agricultural prosperity. The special depression of late years largely comes from economic causes, which have nothing to do with the question of land reform.

34,151. Would you say that the importance of land reform is increased by the fact of depression existing in a large part of the country?—Very greatly. I think that has developed, or rather rendered evident, the defects of the present system in a most striking manner.

Transfer of land.

34,152. Do you consider it extremely desirable, in view of the depression which exists, that there should be a cheap rapid and easy system of the transfer of property?—Certainly. I think that if there is a cheap, simple, and rapid system of transmission of landed property, the arrangement of the property of land will change with changing social circumstances, and we shall not see, as we do at present, the system of the past continue into a state of things which is economically totally different. It is because of the difficulty with which land is transferred, that those arrangements which were made many years ago still exist; and the evils that we lament so much at the present moment come from that.

34,153. Do you consider that the difficulties in adjustment and, I may say, in liquidation, are greatly increased by the particular form of our land system?—Yes. I think the system was quite inelastic; that land did not get transferred as personal property would be, when it became economically advisable; and that the difficulties of transferring were such that people allowed things to remain until it became almost an economic catastrophe to make the change.

34,154. In that view do you consider that every effort should be made to make the transfer of land simple and cheap?—Yes.

Registration of title.

34,155. What is the first suggestion you have to make in that direction?—I am quite convinced that for that purpose the title of land must be a register title. I do not mean merely that the titles are to be registered, but I mean that the title is to be the entry on the register. And I go further than that. I think it is absolutely necessary that the title on the register should be intelligible to the ordinary person, and should not be a matter of expert learning, as all titles are now. For that purpose it is necessary to restrict the interests in land, which the law recognises, and which are capable of registration, to simple forms of interest, so that everybody can understand them. At this present moment, if you were to register all the interests, if you could at a stroke register them all, the general public would be as much at the mercy of lawyers as they are now, because they could not, without a legal education, understand the nature of the interests that were registered. So that to make a register effective the first thing you must do is to recognise only certain types of interests.

34,156. In that view then, I presume, you would limit the interests in land which are recognised to-day to certain very simple heads?—Yes. I should recognise primarily, of course, the freehold. That means that the decaying system of copyhold, with its fines and its uncertainties, should go. From the freehold a man should be able to carve out interests in two ways; he should be able to carve out the lease, and he should be able to carve out the charge; but I do not think it is necessary that he should have power to carve out any more. The consequence is that the register would be a register of freeholds, of leases affecting freeholds, and of charges affecting either leaseholds or freeholds.

34,157. Then you would not allow interests in land to be carved out of the freehold estate in the form which they now can be done under our laws of entail, and so forth?—No. I should meet that in this way; I should

Mr. J. F. Moulton, Q.C., M.P.
9 Nov. 1894.

not prevent land being left subject to trusts, but the trustee would be for all purposes the owner, so far as the register was concerned, and land would stand in exactly the same position as any other investment forming part of the corpus of the trust. For instance, if at this present moment there are debentures of the London and North-Western forming part of a trust, a trustee would have the power to sell them and change the investment into some other investment of a suitable character. I should say that the law ought to make it essential to the position of a trustee of a trust which contained land that he should have the same power with regard to the land, and that the land in the eye of the law should be regarded only as a form of the investment of the corpus of the trust. If that were so, the trustee would be registered as a freeholder, just in the same way as if he possessed the land, and he would have the power of sale. The difference would come in in the fact that the money arising from the sale would be money affected by a trust, but the sale would not be affected by the trust at all. That would get rid of all hampering of land by means of trusts or settlements.

34,158. Because there would be always somebody on the register who would be absolutely entitled to sell the property?—Certainly.

34,159. Subject to the money being distributed or dealt with according to the trust?—Certainly.

34,160. We have approached nearly to that point under Lord Cairns's Settled Estates Act, I presume?—A good way off.

34,161. At all events we have made some approach to it?—I do not think the idea that a trustee is bound to regard the land solely as an investment in which the corpus is for the moment put has ever been part of our law; but certainly Lord Cairns's Act gave much greater facilities for acting as though that were the condition of things. I should permit no restriction on the power of alienation of land forming the corpus of a trust; such restrictions ought not to be permitted, because they instantly create interests in the land other than the simple types I have spoken of.

34,162. Under the law now, if a trustee under an entail or under a will in respect of land, improperly sells the land, he can give no title to it, I suppose; is not that the case?—If he has no power to sell I do not think he can give any title at all; because, of course, it is a title derived from deeds. A register is not worth anything if it depends on deeds. A register of all kinds of interests in land, permitting all interests in land to be registered, is the same thing as a register of deeds; it is neither better nor worse.

34,163. If settlements are to be permitted at all, you would regard them merely as investments of trust funds capable of being sold by the trustees, just as they might sell any other personal property, the subject of a trust?—Quite so. There is one point to which I ought to make special reference, that is, supposing a life interest is given to a person in certain lands, and the remainder is in the hands of trustees or is vested in some other person; I should regard the life estate in possession as being a case of a lease for a life, that life being his own life. But that, of course, does not bring in any new type of interest, because it is a lease. So the freeholder (who is, of course, in the position of a reversioner who has granted the lease), the leaseholder, and the mortgagee would be the three representatives of the permissible interests in land.

34,164. Then it would result that the only difference between absolute and limited ownership would be in this disposition of the resulting funds, and there would always be an owner with regard to the sale?—Yes. What I should propose would be that the register, in giving the name of the freeholder, might have the word "absolute" or "limited" put to it. That would not at all affect the right to give title to the purchaser; it would only put the purchaser on notice that the money was being paid to a person who was a limited owner; and I should make it possible for him to pay it into court, for the court to say to whom it is to go. But that would not affect the title.

34,165. Then once upon the register the land could always be sold by the person whose name is upon the register?—Yes, always; and the title would be an absolute one.

34,166. The title which he conveys would be an absolute one?—An absolute title. Of course, one can immediately see that there might be cases of hardship where persons were on the register by a fraud or by a mistake. I should not bar remedies in any way which sounded in damages, but I should absolutely bar all remedies which sounded in the land itself. So the title would be the title to the land.

Mr. J. F. Moulton, Q.C., M.P.
9 Nov. 1894.

34,167. If a trustee has improperly sold land he would still be responsible, in money at all events, to the *cestui que* trust?—Yes. For instance, supposing he had sold land under circumstances where he was, unknown to the purchaser, making a profit, there would be the remedy against the trustee for the money improperly obtained by him; or if he had sold it under such circumstances of carelessness that it was negligence to sell it for so small a price, there would be the remedy against the trustee for the damages due to his carelessness; but nothing would touch the land itself.

34,168. That the injured person would not have the right to follow the land itself?—Not to follow the land; he would have the personal action sounding in damages.

34,169. Practically, that is now the case with regard to personal property, Consols, and so on?—It is. For instance, take the case of the Factors' Acts; the Factors' Acts are only called into play when there has been an improper dealing with property. That improper dealing is not to affect the title to the property given by the factor, but it does not in any way bar any remedy sounding in damages; and I do not see any advantage at all in barring such remedies—a man ought to be responsible for his actions.

Mortgages on land.

34,170. Then, with regard to the charges, what do you suggest?—As to the charges, what I have to say is that I am one of those who are very strongly in favour of charges on land. I think that the defect which has led mortgages to be regarded with such disfavour arises from what I might, perhaps, call the inertia of mortgages under the present system. A mortgage under the present system is really an absolute ownership according to the old doctrines of common law; but it is only a charge according to the doctrines of equity which of course now prevail in all courts. But the consequence of that has been that there has been a kind of fixity, a stiffness, with regard to mortgages which has prevented to a very great extent their adapting themselves to the changing circumstances. The same sort of thing that I was remarking with regard to the land applies in that respect to mortgages. Now, in my opinion, a mortgage should have absolutely statutable incidents. It should be impossible to vary a mortgage any more than you can vary a bill of exchange or a bill of sale. You can of course vary it as to the amount of the capital, and as to the mode of paying interest, and, possibly, there may be one or two other points in which a certain latitude might be allowed; but for all the incidents of a mortgage, such, for instance, as the powers of a mortgagee, the public should know them like they know those of a bill of exchange. The consequence would be that in the column "charges" you would put down the amount of the charges, the rate per cent., the date at which it was made, and the name of the person entitled. The effect of that on the land would carry with it no fictions, but simply recognised statutable incidents; and I believe men of business, and not only men of business, but men of ordinary intelligence managing their own affairs, would understand exactly the effect of such an entry as that without going to their lawyer at all; and would be able to read the title of the land from the register themselves. If there was a mortgage it could carry no unseen consequence, but they would know that there was a mortgage for so much, at such a rate of interest, and whether it was a first mortgage or second mortgage—that they would know by the date.

34,171. (*Viscount Cobham.*) And upon so much of the land?—Yes, it must be registered against the land.

34,172. Against the whole or part of it as the case may be?—May I put it in this way—I think I appreciate the point. Supposing there is an estate, a freehold, and a man puts a mortgage on half of it; an entry would then be put dividing that freehold into two plots; on the one there would be the mortgage, and the other would be a freehold uncharged. Of course wherever you carve out an interest from an interest, it appears to me that it is necessary to the idea of a register that you ought not to have, as it were, one interest over one part and another interest over another, but that you ought to start a derived entry dividing the land into the two plots. In the same way, when two come into the same hands, I think it is probable that it

Mr. J. F. Moulton, Q.C., M.P.

9 Nov. 1894.

would be found convenient to merge them into a single entry. Of course your register would easily show that. In this way charges would be readily raised and readily paid off. In Prussia they have gone so far as to make charges purely burdens on the land without personal covenants, and I think there is a very great deal to be said for treating them thus, so far as the register is concerned. A man may have a collateral covenant with his debtor to pay, but that is not a register matter. I think the mortgage, so far as it appears on the register, should be purely a burden on the land. Charges of this kind would be a form of property which would readily pass from hand to hand, and, so far as small mortgages and first mortgages are concerned, would take a place in the investment market, which mortgages do not take at present; because, of course, in speaking of a mortgage now, you do not know what title or what interest you are speaking of until your lawyer has seen it. If I know that land described in the first column of the register bears a burden of 10,000*l.*, I know what burden it has, and if I know that the land is worth more than that, I have got an absolutely certain 10,000*l.*, subject, of course, to questions of depreciation—which are matters one has to consider—as one has to consider them in every investment. I believe that investment capital, therefore, would flow into mortgages from investors of a far wider class than those who can touch them at present. If I am not wearying the Commission, I want to point out what I think to be the great advantage of that. The difficulty of the landed question arises to a great extent from the difficulty of realising how far land is what I may call trade plant. Of course it has got a peculiar fixity, it has got certain social advantages; and people have not realised the extent to which it shares all the vicissitudes that we will say a newly patented loom might experience, which could go out of fashion. The land in England is being beaten by better land, that is to say, by land in Dakota, for instance, which, taking it all round, can be worked more cheaply; and it is exactly in the same position, so far as the trade interest in it is concerned, as if it were a fight between the mills in Manchester and new mills set up in Bombay. That only applies, however, to a certain portion of the value of land; and there is a portion of it which is to be regarded as subject of investment as opposed to trade risk. Now I think the best form of tenure for agricultural land is where the tenant farmer has not got to put so much money in as to buy up the investment part of the value of his holding. That is a kind of investment returning 3 per cent. or 2½ per cent., and a tenant farmer who is a business man is doing unwisely when he invests capital in that half. But suppose we imagine that that half is represented by a charge and that the further portion is in his hands; then that is a portion which he directly operates upon by his skill, and by the pains he takes with his land, and any advantage that he gets by his skill then remains his, because the charge on the land is a fixed one and does not increase. So that if we are ever to have farmers farming their own land and doing it effectively, we must have some way in which they can easily get investment money to take up what I may call the investment portion of the value of the farm.

Ownership and security for improvements.

34,173. (*Chairman.*) I presume you would consider that ownership is the highest form of security for improvements?—I think it is.

34,174. Therefore anything which would tend to multiply ownerships connected with occupation would be desirable?—It would, provided that I am not taking a business man's money and forcing him to put it, or a portion of it, into an investment where he has to compete with 3 per cent. money before he can be an owner.

34,175. Do you think that is at present the reason why there are so few occupation owners?—I think it is so.

34,176. Land having such considerable value as an investment, farmers with capital are unwilling to invest so much of their capital in purchasing what is their plant?—Quite so.

34,177. Therefore anything which tends to facilitate transfer and to facilitate mortgage, and which enables what you call the investment part of the property to be realised quickly and mortgaged easily, would tend at once to multiply occupation ownerships?—I am sure it would. The tenure that I like best is a light mortgage which gives no anxiety to the mortgagee, and therefore for which he takes a low rate of interest; and the balance (which is the margin to be defended by the skill of the farmer) to belong to the farmer, because then he can save his capital and use it for the purpose of making that more valuable.

Mr. J. F. Moulton, Q.C., M.P.

9 Nov. 1894.

34,178. It seems to be an unsatisfactory state of things that as a country becomes richer, the number of persons who are both owners and occupiers becomes fewer?—Yes.

Land transfer and cost of mortgages.

34,179. But that results really from the difficulties of transfer and the cost of mortgages?—Yes, the cost and complexity of mortgages. For instance, supposing by this method a mortgage is understood by everybody and its existence is known to everybody, and a man with a few thousands wants to take a farm, there is a certain portion of the value of that farm which he can be sure to get in this way, because there is no question of title, there is no uncertainty or difficulty at all; it is a straightforward thing. Then he would be able to use his capital as business capital. He would have the risks of business and the returns of business if he is a skilful business man; if he is an unskilful business man, an unskilful farmer, he would lose; but that is because he has gone into a business for which he has not the requisite skill.

34,180. And if he is unskilful the sooner he gets out of it the better?—I think so.

34,181. And an easy and cheap system of transfer would facilitate his departing just as it would facilitate his entering?—I think so.

34,182. (*Lord Rendel.*) On the principle on which almost all other industrial enterprises have their capital divided into debenture and share capital?—Just so, only this I think would have advantages in elasticity and flexibility even above them, because the only question, if you wanted to put a mortgage on your land, would be:—"Is the land worth that, with such a "margin that practically I am safe." Now it has been often said:—"But, look, what a tremendous downfall "there has been in the way of value of land; could "anybody prepare for that." I do not think it is wise to frame a system so that a man can look 50 years ahead. It only gives him the sensation of being able to do it, for nobody can look 50 years ahead. But if the system is such that you can readily adjust yourself even to warnings which are warnings of small change, then there is no danger of coming into a condition where there is a terrible contrast between that which gave rise to the arrangement of interests, but which has passed away, and the state of things which you now have to face. I think it is most important that there should be as it were a ready response to change.

34,183. A fluidity of character attaching to the charges on land?—Yes.

34,184. (*Chairman.*) I presume you would say then that the present time, when the value of land is so greatly reduced, is a very good one for commencing a new system which would aim at facilitating the transfer and cheapening the cost of mortgage?—Exceedingly good. At the present moment, when there is undoubtedly a lack of investments for persons who want purely to invest, and not to go either openly or practically into business by taking business risks, I think it would be a very great advantage if there were these open land charges.

34,185. At the present time a great deal of land can be purchased at 10*l.* an acre, and on your supposition that the facilities of mortgaging would make it unnecessary for a purchasing farmer to buy the investment portion of the land, the amount of capital which he would have to invest at the present moment really for the purposes of trade would be extremely small?—Yes.

34,186. As the value decreases so the margin of what one may call the true plant value would be less?—Yes, that is quite true.

34,187. And it would decrease still more?—I think so.

34,188. Whereas in the case, say, of land, when it is worth 30*l.* an acre, the plant value might perhaps be 10*l.* an acre. When the value of the land is reduced to 10*l.* an acre, the plant value might be not more than 3*l.*?—Yes, that is very true.

34,189. Therefore a very small capital would suffice to enable the occupier to become owner, and to go upon the land in the position in which it is most likely he would do his best for the purpose of improvement?—Yes, that is very true. What I want to point out is this, that you can only get your money at investment rates by mortgaging only to the part which has

Mr. J. F. Moulton, Q.C., M.P.
9 Nov. 1894.

investment value, because if the man is going to put his money in a mortgage on to the full value of the land he is really taking a trade risk. He has got what I call the plant margin in his investment, and all its ups and downs he has to bear. The consequence is you cannot expect mortgages for the full value of the land at investment rates, because they are not investments. If you want to get the low investment interest which makes the money such an assistance to the man of business (by which I mean the farmer) you must be content to leave such a margin in his hands as shelters the other and makes it a true investment.

Scheme of land purchase for tenants.

34,190. Then do you think it might be connected with some scheme for facilitating occupiers to become the owners of the land they farm? I feel sure of that. There, I think, is the error in almost all the propositions for enabling tenants to purchase the land they occupy. The defect is this. They are made to pay so much per annum until they have paid for their property, and the consequence of that is that at first they are paying much too little and that afterwards they are paying much too much. For instance, supposing you take property worth 500*l.*, and 500*l.* is lent, say at three per cent., and you pay back a small amount per year; at first you are only paying three per cent. for money which is equal to the total value of the land, which, as I say, is a trade investment; you ought to be paying very much more. But when you have gone on, and, we will say, paid half or three-quarters of it back, then you are no longer paying too little, because the balance due is secured on land of double its value, or four times its value, and you have got down into the position of a purely investment security. It follows that these systems of purchase are only possible if Government will guarantee, and Government in guaranteeing the payment of the full value of the land, as it does, and at first with no other security than the land, is taking an exceedingly bad investment, and it can only do it in exceptional circumstances.

34,191. It can do it in the case of Ireland, because the tenant's interest there is half the value of the land?—There, of course, they are only paying off what I might call the last half—the investment half—but I am not considering a case like that.

34,192. (*Mr. Lambert.*) That is the exceptional case? That is the exceptional case. Take a system of this kind:—Supposing without any Government guarantee you made the interest which is to be paid by the tenant for the purchase money of the property decrease as he paid off the burden, then you might by a proper scale get a system which at every moment was fair both to the landlord and to the tenant, and that without any Government guarantee. I will take figures to make myself a little more intelligible. I do not believe in agricultural land being an investment that ought to pay only three per cent. That is, in my opinion, a misunderstanding of the case. It is a business risk; and I should have thought five per cent. is about as low as persons ought to invest their money in land at, if they are going to do it, from a business point of view. Supposing it is five per cent. that we take; that represents the over-all risk of capital invested in agricultural land. Supposing that there is a farm worth 1,000*l.*; if we are going to have a system by which the tenant can say, "I am going to purchase," and he becomes the owner, and the 1,000*l.* is a charge on that property, it is quite clear he ought to pay the whole five per cent., because he has not improved his landlord's security one bit, and therefore he ought not to diminish his landlord's return. But if he can put in 250*l.* and reduce the charge to 750*l.*, then it is approaching a condition of a well-secured investment and the five per cent. might be made to diminish to four. What would be the consequence of that? The consequence would be that the rent, *i.e.*, the interest paid on the charge, would fall from 50*l.* to 30*l.* for that investment of 250*l.*, which is an investment at eight per cent., and yet the landlord is receiving a rate per cent. of return proportional to his risk as he was before. Neither has gained an advantage over the other. The eight per cent. that the man receives for his portion of 250*l.* is fair because it is secured on land in the dangerous position of a margin; and therefore it is, if I might put it so, a business risk of the more speculative type. If he adds another 250*l.* and reduces the charge to 500*l.*, then it may well be that the fair return for the risk of the landlord would be three per cent.; and then we should find that a man would reduce his risk from 50*l.* to 15*l.* by the investment of this 500*l.* Such a system would leave the parties paying and receiving at all time the right rate per cent., *i.e.*, that representing the risk that the capital is exposed to; and I think that the consequence would be that tenants would do their best to lower the rate per cent. which they were paying by getting that very trade margin into their hand which it seems to me is the thing that we want to see; and the ultimate result would be low mortgages, representing investment money put in at investment rates.

Mr. J. F. Moulton, Q.C., M.P.
9 Nov. 1894.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Sixty-second Day.

Thursday, 15th November 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant Secretaries.*
Alan Mackinnon, Esq., }

Mr. L. J. Rutter.
15 Nov. 1894.

Mr. Lysaght John Rutter called and examined.

34,193. (*Chairman.*) You are a Fellow of the Auctioneers' Institute and a junior member of the firm of Messrs. Walter and Lysaght Rutter, Land Agents, Auctioneers, and Agricultural Valuers, are you not?—I am.

34,194. You have had a large amount of business connected with the sale of land in Essex?—Yes.

34,195. Especially in the worst parts of Essex?—That is so.

34,196. Have these transactions been specially in that part of Essex which have been reported upon by Mr. Pringle, our Assistant Commissioner?—Yes, that would be so.

Mr. L. J. Rutter.
15 Nov. 1894.

Mr. L. J. Rutter.

15 Nov. 1894.

34,197. The very heavy clay districts?—Yes.

34,198. Have you found that in spite of the general depression, land is saleable there in small amounts?—Yes.

Recent sales of land in Essex.

34,199. And lettable in small amounts?—Yes, in small holdings.

34,200. What size of holdings do you mean?—Under 100 acres.

34,201. Still, not small holdings in the sense of the term that they are holdings for agricultural labourers, but for small farmers, you mean?—For small farmers.

34,202. And in spite of the great fall of prices of land in Essex you think that the land is saleable in amounts under that?—Yes.

34,203. Are you able to lay before the Commission a great number of cases in the last few years, where your firm has disposed of land in quantities of that size?—Yes.

34,204. Will you give some illustrations of it?—The first is Oliphant's farm at Basildon; that comprises 230 acres, and the price was 2,000*l.*

34,205. Will you put in that list of cases?—Yes, they are all as let and sold, and the prices and rents are those we obtained (*handing in list*).

34,206. The list consists of two cases?—Yes.

34,207. One of land sold, amounting to 21 cases, and the other of farms which you have let?—Yes.

34,208. (*Sir Nigel Kingscote.*) May we have the dates when those transactions took place?—Since 1890.

34,209. (*Chairman.*) All of them since 1890?—Yes.

34,210. I see in the first case that on Oliphant's Farm, comprising 230 acres, which was sold for 2,000*l.*, you say there that since that the house has been re-sold, and 66 acres for 2,295*l.*?—Yes. That sale took place this last few weeks.

34,211. When did the first sale take place?—I have not the exact dates, but they are all since 1890, so far as I believe.

34,212. How many in 1894?—Oliphant's was sold in 1894.

34,213. Both the sale and re-sale took place then, did it?—Yes; and Moat House Farm, Basildon, in 1894; Summer's Farm, Laindon, was re-sold in 1894. Then Hill Farm, Laindon, in 1894.

34,214. (*Mr. Chaplin.*) Were any let?—Yes. Lyndsay's Farm, in 1894; and Southall Farm, Ramsey; and Blue House Farm, Laindon; and Page's Farm, Dunmow.

Particulars of Scalders' Farm, Canewdon.

34,215. (*Chairman.*) As to Scalders' Farm, Canewdon; when was that let?—That was sold last year, in 1893.

34,216. You are speaking of Canewdon Farm, Rochford?—It is Scalders' Farm, Canewdon, Rochford.

34,217. That was sold as well as let?—Yes, that was sold as well as let.

34,218. When was it sold?—In 1893.

34,219. 179 acres were sold for 1,250*l.*, and then it has since been let for 140*l.* a year, I see?—Yes, that is so.

34,220. Do you know the condition of that farm?—It was out of cultivation.

34,221. Is it in a very bad condition?—It was in a bad condition.

34,222. Was it falling back into twitch?—Yes, the arable land was overgrown with twitch and weeds.

Sales in 1893.

34,223. May we have what you sold in 1893, as far as you can tell us?—Rose Hill Farm, East Hanningfield, was sold in the beginning of 1893.

34,224. In that case 40 acres were sold for 940*l.*?—Yes.

34,225. Was that land in bad condition?—No, that was in fair condition.

34,226. (*Mr. Chaplin.*) Whereabouts is that; is that in Mr. Pringle's district?—That is in East Hanningfield.

34,227. Where is East Hanningfield?—It is about seven or eight miles from Chelmsford.

34,228. (*Chairman.*) Was that in a bad district?—Yes, there are a great number of farms in that neighbourhood out of cultivation.

Mr. L. J. Rutter.

15 Nov. 1894.

34,229. What else did you sell in 1893?—Canewdon Farm, Rochford, Norpitts Farm, Canewdon, and Scalders' Farm.

Tithe.

34,230. (*Mr. Channing.*) On Scalders' Farm, may I ask whether there is a heavy tithe payable by the landlord?—Yes, there is a heavy tithe upon it.

34,231. (*Chairman.*) Could you give the amount of the tithe on that farm?—The tithe of that is 52*l.* 14*s.* 3*d.*

34,232. (*Mr. Chaplin.*) May I suggest that it would be for the general convenience if you give the dates first, and then the details?—I will give the dates so far as my memory serves me. Had I known that you wanted the dates, I would have had the dates of each farm.

34,233. (*Chairman.*) Perhaps you will supply the dates when you receive your evidence for correction?—Very well.

Condition of Essex in 1884 and 1894.

34,234. You will admit that so far as you know of that part of Essex, the state of things that now exists has existed for the last ten years?—We really did not find any difference in selling the land in 1890—we could sell it just as easily then as now.

34,235. Do you remember the condition of that part of Essex 10 years ago, was not it very much what it is now?—Yes, I do not think there has been any difference in the last four or five years.

Sales in 1893.

34,236. Have you now told us all the cases where there were sales or lettings in 1893?—Claverhambury Manor Farm was let in 1893, and Gooseley's Farm, near Yeldham, was let soon after it was sold.

34,237. In what year?—In 1893.

Tithe.

34,238. Now in all these cases was there a heavy tithe?—On Canewdon Hall Farm the tithe was 101*l.* 14*s.* 9*d.*

Land tax.

34,239. Do you know what the land tax was too?—No; I believe that particular farm was free of land tax.

34,240. (*Mr. Lambert.*) Are there any other outgoings beside the tithe or land tax or anything else?—Yes, but not paid by the owner.

Canewdon Hill Farm.

34,241. (*Chairman.*) That particular farm was also out of cultivation, and there was no valuation?—No valuation.

34,242. (*Mr. Everett.*) And it had two years tithe accumulated on it, and a third beginning to run?—That I could not say. The tithe was paid by the vendors up to the time of purchase.

Tithe.

34,243. (*Chairman.*) I presume in that case of the Canewdon Farm, if it had not been for this high tithe the price would have been very much higher?—Yes; it works out at 5*s.* 10*d.* an acre. It is rather high.

34,244. That being a preferential charge it is almost half the value of the land at 3,000*l.*?—The tithe is slightly reduced now.

34,245. That is the commuted value?—Yes.

34,246. And it would now be rather less?—Yes.

34,247. It would be about 75*l.*?—I believe it is actually 74*l.* and some odd shillings.

34,248. That would represent a value of nearly 2,000*l.* considering that it is preferential charge?—Yes, quite that.

34,249. And if it was free of tithe, the value would have been very much higher?—Yes, certainly.

34,250. Now in the case of lettings referred to I presume that in all cases the land owner would pay the tithe and therefore the rent includes the tithes?—The rent includes the tithe.

Effect of high tithe and land tax.

34,251. Do you consider that the high tithe and the high land tax in Essex is a very considerable burden to those proprietors?—I do.

34,252. And as a general rule it detracts very much from the selling and letting value?—Yes.

34,253. It makes it more difficult to sell?—In some cases very difficult.

34,254. Can you point out any special case of difficulty?—Yes, the Norpitts Farm, Canewdon. The tithe of that was very high, 112*l.* 11*s.* 3*d.*

34,255. I gather from the list that you put in that the smaller holdings from 20 acres up to 60 acres, or thereabouts, sell and let for a much better price, relatively, than the much larger ones?—Yes, that is so.

Mr. L. J. Rutter.
15 Nov. 1894.
Sub-division of farms.

34,256. How do you account for the fact that these larger farms are not broken up into smaller ones?—The owners do not seem inclined to lay out the amount of money that would be necessary in making additional farmhouses and buildings.

34,257. If that could be done, much of this land that is now in large farms uncultivated might be sold or let again?—Yes, in some districts.

34,258. But in the worst districts would that be so?—In some of the districts, no doubt, they would let and sell.

34,259. The difficulty is, that they are let as large farms, and the buildings are only appropriate for large farms; is that so?—Yes; with some of the holdings it would be expensive and difficult to divide them, on account of having no roads.

Sale of small farms in Essex.

34,260. Then should you say, as the result of your experience, that even in the worst part of Essex, if the land is in comparatively small farms, that it can be both sold and let?—Yes, if there is a fair proportion of grass.

34,261. If there is a fair proportion of grass; what should you say would be about a fair proportion?—About a third.

34,262. Do you mean old grass?—In some cases I have sold it, if properly laid down, even with a new pasture.

Grass land.

34,263. (*Viscount Cobham.*) We have been told that there was no grass in the west parts of Essex?—I could not agree to that at all. My experience is to the contrary.

34,264. (*Chairman.*) But in most cases that you have had to deal with, there are some portions in grass?—Yes, in very good grass indeed.

34,265. (*Mr. Lambert.*) Is it a general rule that there is very good grass on the farms?—In some of the holdings.

34,266. Would it be a general rule?—I might say, yes, as a general rule. On these farms of Canewdon, there was a certain portion of land in very good old pasture.

34,267. Yes, but these are farms that you have sold yourself. I am speaking rather more generally of Essex. Is there a fair proportion of grass? You said one third grass, good grass, in Essex?—No, I could not say that there is, because the majority of the farms are arable.

34,268. And these arable farms would not be so saleable?—Not if they are all arable.

Area of land out of cultivation.

34,269. (*Chairman.*) Take the case of Oliphant's Farm, of 230 acres, sold at 2,000*l.*, and since re-sold 60 acres for 2,295*l.* In this plan of Mr. Pringle, I think that farm is indicated as being all tumbled down into bad grass?—Yes, that is not the case.

34,270. Of course, Mr. Pringle in this particular case may have been led astray; but as a matter of fact the land is not in the condition as reported in this map?—No, it is not. This last year there were some splendid crops, last year it was too dry; but there have been some very good crops indeed. There is, roughly, about 50 acres of old meadow land on the farm.

34,271. Out of 230 acres?—Out of 230 acres.

34,272. Would you say, judging from the fact that on some of these farms a certain portion, as in the case of Oliphant's Farm, has good old grass, that it is reasonable to suppose that the remainder could be laid down into grass?—Yes, that could be laid down. That is a catalogue of the particular sale (*handing in the same*).

34,273. Can you point out where that is in this map of Mr. Pringle's?—Yes, that is at Basildon.

Great Gubbins' farm.

34,274. Take the case of Great Gubbins farm, what number is that?—It is not in the list.

34,275. What is the condition of Great Gubbins' farm?—That is out of cultivation, but there is a considerable amount of old meadow land on that.

34,276. Is that marked on this map?—Yes, that is all marked black.

34,277. Have you got it in hand for sale?—We have.

34,278. And have you had an offer for it?—Yes, within the last few days, 20*l.* an acre for sale.

34,279. What is the acreage of that farm?—About 360 acres.

34,280. That is relatively a much higher price for the size of the farm than any of those in your list?—Yes, it adjoins the railway station. We have also had offers to rent it.

Mr. L. J. Rutter.
15 Nov. 1894.

34,281. What offer have you had to rent it?—We had an offer to rent it on lease, 14 or 21 years, at 10*s.* an acre the first year, and 1*l.* an acre afterwards.

34,282. The land owner paying the tithe?—Yes, the land owner paying the tithe.

34,283. What is the tithe there?—I do not remember the exact amount of the tithe on that particular farm.

34,284. I presume it is considerable?—It is about 5*s.* an acre.

34,285. (*Mr. Little.*) And the land tax?—That I do not know.

34,286. (*Chairman.*) And on this the tithe is 5*s.*, an acre, and have you got an offer of 20*l.* an acre to purchase?—To purchase, yes.

34,287. What is the amount of old grass upon it?—I should think, roughly speaking, about 40 or 50 acres.

Sub-division of farms.

34,288. Have you had the experience of the sale of land for very much smaller holdings?—Yes, considerable experience of cutting up farms in holdings of from one to 10 acres.

34,289. Whereabouts?—In that particular district around Laindon and Basildon.

34,290. Could you give any facts with regard to any one of these sales?—Yes, we have cut up Summer's Farm, and resold that in small lots; and we are dealing in that way with Oliphant's and Moat House farms.

34,291. What was the price paid for it, before it was cut up?—Summer's Farm, Laindon, 162 acres, 2,000*l.*

34,292. How near is that to the station?—It is about two miles-and-a-half from the station.

Sale of small holdings.

34,293. And then it was laid out in a sense, I suppose?—No, it was not laid out; we sold it at two or three acres at a time as the opportunities occurred, small holdings for agricultural purposes.

34,294. How much have you sold in that way?—About 146 acres.

34,295. But how many lots?—If I remember rightly, about 16 or 17 lots.

34,296. And at what kind of rates?—At from 15*l.*, to 25*l.*, an acre.

34,297. The purchaser paying the price spread over a term of years?—No.

34,298. Paying down?—Paying down on completion.

34,299. What class of people have bought?—One gentleman was a farmer in Wiltshire, who used to farm about 600 acres; he bought a house and 40 acres. And some of the others are salesmen. One man is a salesman in Covent Garden Market, and the other keeps a small market garden at Deptford and a greengrocer's shop; and another is a retired farmer; and another purchaser has purchased with the idea of using it as a poultry farm.

34,300. Have these persons built houses there?—Yes.

34,301. All of them?—Yes.

Sub-division of farms.

34,302. Have there been other cases of the same kind within your experience?—Yes; we are dealing in the same way with Oliphant's farm.

34,303. How many lots are you going to cut that up into?—We have only sold, up to the present, four or five lots.

34,304. And you have only begun lately?—Quite lately. There was a tenant till last Michaelmas, so that we have not been able to do much with it.

34,305. What size of lots have you sold it in?—From three to eight acres. One gentleman has bought about 40 acres.

34,306. How near is that to the station?—It is about 2½ miles from Pitsea and 3 miles from Laindon.

34,307. Do you transact the sales for them?—That is so.

34,308. The purchaser may have made a good thing. You say he has re-sold the house and 66 acres for 2295*l.*, and he gets the residue for nothing, and he now is re-selling it in lots for which he is getting 15*l.* or 20*l.* an acre?—More than that on that estate. We have sold some at 35*l.* per acre without a house.

34,309. And if he can sell the remainder by degrees at anything like that price, he may make a good thing of it?—A great many more lots would have been sold, but we could not deal with it until the tenant gave it up last Michaelmas.

34,310. Have there been many other cases where farms have been bought and made into small holdings?—We have sold some of the Hadleigh and South Benfleet.

34,311. Have other persons bought and sold in the same way?—Yes, but I believe in small lots, more for building plots.

34,312. (*Mr. Chaplin.*) Is that in the list here that you are speaking of?—Yes, Badger Hall, Hadleigh.

34,313. (*Viscount Cobham.*) How far is that from London?—About 30 miles.

34,314. (*Mr. Long.*) Is Hadleigh the same place where the Salvation Army have their settlement?—It is about two miles from it.

34,315. Their settlement is at Hadleigh?—Yes, at South Benfleet.

Decreased demand for small holdings.

34,316. (*Chairman.*) Should you say that there is a demand for small holdings of this kind?—No, I do not think that it could be done to any extent, because the sale has fallen off very much during the last two years.

34,317. (*Mr. Chaplin.*) The sale of small holdings?—Yes, the sale of small holdings.

34,318. (*Viscount Cobham.*) Do you mean for residential purposes, or for agricultural purposes?—For agricultural purposes.

34,319. (*Chairman.*) Now I suppose you fully recognise that the district is suffering severely from depression?—Yes, I should say so. The land there is rather stiff.

Burdens on the land.;

34,320. Have you any suggestions to make as to what can best be done with it?—Well, there are great drawbacks in selling the land there; one is that the tithe is high, and the rates are very high, and the roads are very bad indeed. In fact, the roads from Laindon Station to Basildon are at times almost impassable.

34,321. Do you here complain of the land tax too?—Yes, the land tax is rather high; but on these particular farms we have been dealing with, it is free of land tax. The land tax has been redeemed.

Sub-division of farms.

34,322. I presume, from the evidence that you have given, that you consider that the fact that so much is laid down in large farms is a further difficulty?—It is a difficulty to lay them out in many cases; the farms would not be suitable for cutting up. On many of the large holdings on account of not having sufficient road frontage, they would not be able to build houses without making roads.

Small holdings.

34,323. When you spoke just now of the demand for small holdings falling off in the last two years, you meant the very small holdings, not the small farms?—I mean very small holdings for sale.

34,324. From one acre up to ten acres?—Yes.

34,325. But for small holdings, which are small farms from 10 acres up to 80, you still find a demand?—That is so.

Deterioration of the land.

34,326. I presume that the very deteriorated condition of the land accounts for the difficulty of selling and letting too?—I should say so.

34,327. Is much of the land in such a condition that it would require 8*l.* or 10*l.* an acre to put it into good condition?—I should say not. Some of the land that has seeded itself down in some cases would be better, I should say, left as it is. I do not think that it would pay to break it up at the present time.

34,328. (*Mr. Chaplin.*) What is it worth in its present condition?—For selling or letting?

Value of land.

34,329. What is its value per acre; what would you take for it yourself?—It depends upon the position—from 7*l.* to 10*l.* an acre.

34,330. I mean the rent?—About six or seven shillings an acre.

34,331. What does the tithe amount to?—In many cases the tithe amounts to the rental value of it.

34,332. (*Viscount Cobham.*) How can it pay to put up the necessary buildings?—I am speaking of larger holdings. Smaller holdings we can let at 1*l.* per acre, but it is the larger farms that we find a difficulty about.

34,333. (*Chairman.*) It is the larger farms in a deteriorated condition with a high tithe where the tithe amounts to almost the letting value of the land that you find a difficulty?—Yes, in those cases it is very difficult to let them at a fair rent, especially when they are all arable land and a distance from a railway station.

34,334. And looking at the condition of the land?—Yes, taking the condition of the land into consideration.

34,335. And there you doubt whether it would be worth while to put the land into good condition?—That would mean a considerable outlay in a great many cases.

34,336. What kind of outlay, 8*l.* to 10*l.* per acre?—No, about 5*l.* or 6*l.*

34,337. (*Sir Nigel Kingscote.*) As to these instances you have given us, have you acted simply as the auctioneers in the matter, or have you speculated and bought some of the land and re-sold it?—We have simply acted as agents for the vendor or purchaser as the case may be.

34,338. (*Mr. Little.*) Are these sales that you have given us particulars of in all cases sales of the entire farm, or portions of them?—They have been sales of the entire farm except where we have sub-divided them and re-sold them.

34,339. In letting the farms the rent in all cases was inclusive of tithe and land tax, if any?—That is so.

34,340. There are no other outgoings falling upon the landlord?—No.

34,341. No sewers rate?—Nothing of the kind.

Conditions of letting.

34,342. What are the general conditions upon which the farms are let? Are they all let on pretty much the same terms as regards wheat cultivation and sale of produce?—No, in some cases there are restrictions as to the sale of produce.

34,343. Is there a valuation to be paid on entry?—Yes, as a rule.

Valuation.

34,344. Is the custom of the country a heavy valuation?—In some parts of Essex it is rather high.

34,345. Where there have been fallows it would be rather a heavy entry?—That would be so.

34,346. But owing to the present condition, the fallows not having been taken on entry, it would be comparatively easy?—Yes.

34,347. What would the valuation amount to on a purely arable farm on the average?—About 30*s.* to 2*l.* an acre if it had been pretty well farmed.

34,348. That on a nett rental of the landlord of how much?—Say about 12*s.* to 15*s.* an acre.

34,349. Then 2½ years landlord's rent would be the cost of the valuation of the incoming tenant?—Yes, where the farm has been fairly well farmed.

34,350. Have you in letting these farms been able to get from the incoming tenant the full amount of the valuation, or have you had to give it?—No, in each case we have always got the full amount of the valuation.

34,351. (*Mr. Chaplin.*) Are you a member of the Surveyors' Institution?—No, I am not.

34,352. Are any of your firm connected with it?—No, we are not.

Deterioration in cultivation.

34,353. When you speak of the outlay that would be necessary to restore this land into good condition, you speak from a practical knowledge of farming?—Yes, I have been a tenant farmer myself.

34,354. (*Chairman.*) Where have you held your farm?—In Surrey and Kent, and Hertfordshire, and in Essex.

34,355. In the west part of Essex?—No.

34,356. (*Mr. Chaplin.*) Take the case of the worst and strongest clay lands in Essex; we are told that in great quantities they have gone out of cultivation and become practically derelict. How much per acre would it cost to restore it to its former condition?—It would depend a great deal upon the soil and the situation of the farm.

34,357. I am speaking of the worst and strongest clay lands?—About 8*l.* to 10*l.* an acre of the very stiff clay lands.

34,358. Such as has been described to us as three horse land?—That would be so.

Mr. L. J. Rutter.
15 Nov. 1894.

34,359. In the case of three-horse land it would cost 8*l.* to 10*l.* an acre to restore it?—Yes, to get it into a fair state of cultivation again.

Sale of land.

34,360. In the case of Oliphant's farm you speak of, that was bought by you for a client, and is in course of being re-sold again?—Yes.

34,361. Does the same thing apply to most of the other instances you have given; are they bought for residences or for purposes of re-sale?—No, with the exception of three farms the others have been all bought for agricultural purposes.

34,362. By the people who farm them themselves, or who desire to let them?—No; in the majority of cases they have been sold to people who wish to farm them themselves.

Condition of farmers.

34,363. In the case of your own sales that you made so long ago as 1890, have you any information as to the present condition of the people farming them?—Yes, I was over one a few days ago, and I found the farmer doing very well indeed.

34,364. Does that apply to most of them?—To many cases.

34,365. The majority of cases?—Yes, the majority of them.

34,366. (*Mr. Channing.*) What size farm was this which was doing well?—173 acres, Westwick Farm, near Farnbridge.

Land out of cultivation.

34,367. (*Mr. Chaplin.*) The majority of these instances which you have given us, I understand, are in the worst districts?—Yes, there is a considerable quantity of land out of cultivation.

34,368. Are the majority of them strong lands?—Yes.

34,369. As a rule there is nothing exceptionally favourable in those particular instances?—No, I should say not.

34,370. They are a fair sample, we may take it, of the bad strong land in Essex that has gone out of cultivation?—Yes.

34,371. On an average what have they given for it per acre?—The farms in Canewdon would average from 7*l.* to 9*l.* per acre.

34,372. Taking the instances that you have given us together, what would the general average be?—I should think about 14*l.* to 15*l.* per acre.

34,373. (*Chairman.*) It would appear from the list that the price of the larger farms is relatively much less than the smaller ones, as you go down the price increases?—Yes.

34,374. (*Mr. Chaplin.*) I understood that. (*To the witness.*) Then 14*l.* to 15*l.* an acre would be about the average for this bad land, and some of it has been bought and gone quite out of cultivation?—Quite. I might mention that that land at Canewdon is not only a great distance from the station and out of cultivation, but it has a very expensive sea-wall to keep up.

34,375. In addition to the 14*l.* to 15*l.* an acre on this extremely bad land, according to you it would take 10*l.* per acre more to restore it into decent condition, which would come to from 24*l.* to 25*l.* per acre?—On some of the farms it would be necessary, but in most cases the tenants have bought them with the idea of using them for grazing purposes.

Condition of farmers.

34,376. In spite of this very large outlay on this extremely bad land, they are making it pay; doing well you say?—Yes.

34,377. What is the character of the grass where it has tumbled down itself to grass?—In some cases rather poor.

34,378. What is the grass worth an acre?—To rent?

34,379. Yes.—Well, not more than 5*s.* or 6*s.* per acre in some parts of Essex.

34,380. How do they make a profit when they to spend 24*l.* to 25*l.* an acre?—In this one particular instance the person who purchased is a cattle dealer and breeder.

34,381. That was an exceptional case; but in the case of the others who are doing very well?—The others doing well are using it for a dairy farm.

34,382. Are any doing well who are not using the land for those two purposes?—Yes; the tenant of Clavorhambury Manor Farm is doing very well.

34,383. What purpose is he putting it to?—He is using it for grazing stock and growing hay.

Mr. L. J. Rutter.
15 Nov. 1894.

34,384. (*Viscount Cobham.*) Is that in the Canewdon district?—That is at North Fambridge, in the Maldon district. That farm also has about a mile or a mile and a quarter of sea-wall.

34,385. (*Mr. Channing.*) Is that occupied by the purchaser?—That is occupied by the purchaser; he is a Scotchman.

Sub-division of farms.

34,386. (*Mr. Chaplin.*) In regard to this farm of Oliphant's, that is rather an exceptional case. I understand that is being sold for the purpose of small holdings?—That is so.

34,387. For market gardens and for poultry?—That is so.

34,388. Do you know how the people who have taken it for that purpose are succeeding?—I believe fairly well. They have not been long enough on that particular farm.

34,389. How long have they had it?—Only a matter of a few months.

34,390. That is an experiment yet to be tried?—But adjoining the Summer's Farm, at Maldon and Basildon, some of them are doing fairly well, and are increasing their holdings.

Demand for farms.

34,391. I suppose there is an enormous amount of land in this district in the market that people would be very glad to sell?—Not that I am aware of; unless they could get their price. I find a difficulty in finding farms in that district for clients.

Sale of land.

34,392. What is the land you have sold altogether since 1890?—The selling and letting amounts to something over 5,000 acres.

34,393. And you found a great deal of difficulty in getting it?—In getting land at a fair marketable price.

34,394. At 10*l.* or 15*l.*?—At 10*l.* or 12*l.* an acre.

34,395. What could you get it for, have you any idea?—Well, I do not know of any for sale in that particular district anything like that price at the present time.

34,396. How do you hear of the land?—As a rule we advertise for it, if we have a client who wants land in that particular district.

Demand for farms.

34,397. Have you plenty of clients wanting it; is there a considerable demand for the land?—We have a great number—we have several clients who would purchase estates.

34,398. At what price?—10*l.* or 12*l.* an acre.

34,399. That is, that there is a considerable demand for this land even now, according to your experience, at a price which, including the necessary outlay upon it, would be something like 20*l.* an acre?—Yes, we find it so. They are principally Scotch farmers, and farmers from the west of England, and they get it into cultivation by degrees, a small portion at a time.

34,400. (*Chairman.*) I understood you to say that many of the purchasers did not intend to lay out the money in improving, but rather to keep the land for cattle and so forth; is that so?—That is so.

34,401. (*Mr. Lambert.*) Is it improved by degrees?—That is so.

34,402. (*Mr. Long.*) Are these cases that you have given us all in Essex?—All in Essex.

34,403. And these applicants that you say you have in such considerable numbers, are they willing to take farms only in Essex, or would they go elsewhere?—No, the applicants that I speak of now, want farms in Essex at a low price. We have not any land in other counties at anything like that price.

34,404. But there is a great deal of land at 10*l.* and 12*l.* an acre?—That is so, considerably further from London.

34,405. How many miles is this from London?—The land round Laindon is 22 miles from London.

Sub-division of farms.

34,406. Would you say that there is a great deal of land within 50 miles of London that has been sold, or would be sold if they could find purchasers even at a less price than that?—There has been some sold in Hampshire; large sheep farms; and we have sold some at 5*l.* an acre. They have been large holdings, entirely arable.

Mr. L. J. Rutter.

15 Nov. 1894.

34,407. Those would be for those purposes you mentioned?—It would not be for cutting up, as it is a long way from the station, and there is not a sufficient road frontage.

34,408. But supposing a certain distance from a station. You are near to a station when you are three or four miles from it?—Well, Whitchurch is two-and-a-half to three miles, at the outside.

34,409. Do you think there is any difficulty in breaking up those large farms? Would not it depend upon the nature of the land?—Some of the stiffer land I do not think it would answer to break up. That is entirely arable where there is not sufficient road frontage to enable an owner to build a house and buildings at the side of the road.

34,410. Are you aware of the chalk lands of Oxfordshire, Berkshire, and Wiltshire?—Yes.

34,411. Do you think that that principle could be applied to the Down lands?—We have tried it in the neighbourhood of Whitchurch, and it has answered fairly well; but not so well as in Essex, because the land on the chalk is not suitable for fruit growing.

34,412. Do you mean Whitchurch, near Andover, Lord Portsmouth's place?—Yes.

34,413. But only a portion of the parish of Whitchurch is land of the description that I am referring to. There is a large quantity of excellent grass land, and water meadow at Whitchurch. The Test flows through and there is excellent grass?—Yes.

34,414. But I am rather directing your attention to the big Down farms; for instance, the district that lies between Andover and Winchester; or take the country that lies between Devizes and Salisbury; or in Berkshire, the country that lies between Churn and Swindon, where those manœuvres have been held on two or three occasions; do you think that land of that character is capable of being broken up into the small holdings that you have been alluding to?—Yes, I should say so.

34,415. I think you said just now that the want of railway communication and road frontage was the difficulty?—Yes.

34,416. Where is the railway communication, on Salisbury Plain?—On Salisbury Plain there would be a difficulty.

34,417. On any of the Down lands there is no railway communication to any of those parts of the country that I am speaking of?—If it is too far from the station it is almost impossible to sell it.

Tithe.

34,418. (*Mr. Dalton.*) Have you had any experience in the sale of tithes in Essex?—No, I have not.

34,419. There is a farm, Claverhambury Manor Farm, in which you give the price of the tithe rentcharge as 100*l.*?—That is a tithe rentcharge, that does not vary, that has been always 100*l.*

34,420. It is not the price given for the rentcharge; that is the annual rentcharge?—That is the annual rentcharge.

34,421. Because it is entered under the heading of prices in your table?—It should not have been; it was a clerical error.

34,422. Can you say at all what the capital value of the tithe is when put up for sale; how many years purchase would be given for this tithe in Essex which is very near the rent?—No, I could not.

Buildings.

34,423. What class of farmhouse and buildings are there on most of those farms?—Fairly good.

34,424. They represent a considerable portion of the purchase money, in some cases?—No. Although I say fairly good, on Oliphant's farm the value of the house was about 400*l.*

34,425. You do not think that in most of these cases the value of the farmhouse has greatly affected the price of the farm?—No, I do not think it has. It has been an inducement where there was a fairly good house, although lath and plaster, for the purchaser to buy, because they have been roomy.

34,426. What is the object that makes the owners unwilling to part with this land for 10*l.* or 12*l.* an acre?—I do not say unwilling altogether, but they do not care to sell; in many cases they have paid a great deal more for the land, and they are trying to see if there will be an improvement, and then sell it.

34,427. (*Chairman.*) They are waiting in hopes of better times?—Yes. *Mr. L. J. Rutter.*

34,428. And in some cases the land may be mortgaged heavily, and the owner has got no margin?—That is so. In a great many cases these farms were sold by the mortgagees. 15 Nov. 1894. Mortgaged properties.

34,429. (*Mr. Lambert.*) What do you consider is the ordinary size of a holding in Essex?—The majority of the farms are large holdings of from 300 to 400 acres. Sizes of holdings

34,430. Are they lettable?—Under 100 acres they let readily.

34,431. And the land that has tumbled down to grass is let for 5*s.* to 6*s.* per acre?—Yes.

34,432. And to bring it back under a proper state of cultivation you say would take 10*l.* an acre; and how much would you let it for then?—It would depend upon the position of the farm to a certain extent.

34,433. Presuming that a man took one of these farms, and spent 10*l.* an acre upon it, and brought it back into a decent state of cultivation, and the land was worth 5*s.* or 6*s.* per acre before, what would it be worth then?—Probably 15*s.* an acre.

34,434. Do you think that the additional outlay would be recouped in additional rent?—It might. It would depend upon the position of the farm and the class of farm.

34,435. (*Mr. Channing.*) I want to ask you whether, in connexion with Scalders' Farm, Canewdon, the nett rental would be about 90*l.*?—Yes. Sub-division of farms.

34,436. I am taking that as an instance merely. In your experience of similar cases, is the present purchase price sufficiently low to enable a landlord in splitting up a farm to leave a margin for putting up the necessary buildings?—Yes, I should say so.

34,437. If he re-let it in small holdings?—For instance, in Oliphant's Farm the present purchaser has purchased a house and buildings, with about 48 acres, and we have a client who would be willing to rent that at 100*l.* a year, although the last tenant only paid 60*l.* for the 230 acres.

34,438. On Westwick Farm would you mention the tithe?—I do not remember the exact amount of the tithe on that farm.

34,439. With regard to the water supply. Is it your experience that the want of water prevents any of those farms being let?—Yes, it is a great drawback in both the letting and selling of farms; especially to those farmers who have come from districts where they have had a good water supply. Deficiency of water supply.

34,440. Is it possible in its present economic condition to provide those clay districts with a water supply?—Not in a district where there are not many houses, but in a district where the land has been cut up I think it would pay to provide a water supply.

34,441. (*Mr. Everett.*) Do you know Laindon Station?—Yes, very well indeed. Sale of land near Laindon.

34,442. There have been farms there both allotted out and sold—a great deal to London people—is not that so?—I believe so, adjoining the station.

34,443. And a good many of the purchasers, after paying the deposit have abandoned the land altogether?—That I am not in a position to say, because I have not had anything to do with the estate; but I see some houses now being put up on the estate.

34,444. Have you been that way in the last few months?—I go down there, as a rule, once a fortnight.

34,445-6. I was there a month ago, and saw a number of plots apparently abandoned, and I was told that the purchasers had washed their hands altogether of them?—Quite so.

(*Chairman.*) I was there too. Some of those farms were put up in lots. Persons were invited from London on the promise of return tickets free and no charge for luncheon, and then after luncheon they put up those things and the purchasers were only asked to deposit five per cent. Under the influence of the luncheon they bought at from 15*l.* to 20*l.* an acre, and having paid their deposit they never turned up again. There are about a dozen cases of that kind in that district, and some of the land is most undesirable.

(*Witness.*) Perhaps I might state that many of those people who buy small holdings do not read the restrictions; and after signing the contract I am told that

Mr. L. J. Rutter. 5 Nov. 1894.

the restrictions are such that they have not capital to put up the houses necessary, and therefore, rather than borrow they let it fall through. I know two cases of purchasers who have done that and bought elsewhere where there were no restrictions.

34,447. (*Mr. Everett.*) I saw places where fruit trees have been planted and the whole expenditure has been abandoned, and they are standing there still and the land is derelict?—I think in some cases the men have bought land and are going down to build houses on it. I know of two cases of men who have bought the land for that purpose, and later on they intend to build upon it.

34,448. (*Mr. Elton.*) These small holdings would be generally purchased for residential purposes?—No, I do not think so in that district, because the roads are not sufficiently good.

Markets.

34,449. I have only one question as to one of your suggested remedies. You say, "better facilities for market;" is it your idea that there ought to be an Act for regulating markets? I think if the authorities of the various towns held a market say, once a week, or once a fortnight, that it would be an inducement for purchasers to go there, and also small farmers could have a stall and sell their own produce.

34,450. That is if the tolls were not heavy?—If the tolls were not heavy.

34,451. And to get markets with light tolls you would have in many cases to alter very much the existing system of markets?—That would be so. It is carried on to a certain extent in several towns in the north of England to an advantage.

34,452. Did you have anything particular to do with the market system of Essex when the Market Commission sat?—No, I did not.

34,453. You have not read their recommendations?—No, I have not.

Mr. L. J Rutter. 15 Nov. 1894.

34,454. (*Viscount Cobham.*) Where else did you farm in Essex?—In the Loughton district.

34,455. Not in this very distressed district?—No.

Grass land in Essex.

34,456. What grounds have you for disagreeing with Mr. Pringle as to the ability of this very stiff land to carry grass?—Well, I have found myself that it carries grass fairly well if properly laid down.

34,457. You have seen the grass growing on those derelict farms?—I have; in fact, I have more than that. I have had some seeded down for various clients.

34,458. Ordinary meadow grass?—Ordinary meadow grass, and they take very well if properly attended to after seeding down.

Drainage.

34,459. I think Mr. Pringle says that those lands are water logged in the winter, and in the summer they get burnt into a brick?—Yes, where the water has not been drained off. That is one drawback in some of the farms in Essex; one owner will keep his ditches all right and the adjoining owner does not drain them and and it is impossible to keep the water off the land in that case.

34,460. It is necessary that the land shall be well drained before anything like good grass would grow; is that so?—That is so; the small furrows that they plough out are almost too small for the grass, they ought to be deeper to enable the surface water to get off.

34,461. (*Chairman.*) When you speak of seeding down, could you do that without steam ploughing and get rid of the twitch?—I think in the majority of cases it could be done with horse labour.

34,462. By seeding it down, you mean that the land should be just cultivated?—Yes, and land should be cleaned.

The witness withdrew.

Mr. W. H. Hall.

Mr. W. H. Hall called and examined.

Mr. W. H. Hall.

34,463. (*Mr. Little.*) You are a landowner in the counties of Cambridgeshire, Oxfordshire, and Buckinghamshire, I believe?—That is so.

Acreage of estates.

34,464. Will you give us the extent of your estates in the different counties?—In Cambridgeshire I am a life tenant of, in round numbers, 5,600 acres.

34,465. (*Chairman.*) Is that the celebrated Six Mile Bottom?—Yes; the game is the most valuable part of it. Then in Buckinghamshire and in Oxfordshire I have 2,500 odd, making in round numbers 8,000 acres.

34,466. (*Mr. Little.*) Have you been in possession of those estates for many years?—I succeeded to the Six Mile Bottom portion—that is practically half, 2,800 acres—to the late General Hall in the year 1872, those acres having been purchased by him about 50 years previously for upwards of 100,000*l.* I am sorry to say I have not the exact figures, but I am certain that I am under the mark. To the other half of the Cambridgeshire—that is 2,800—and the whole of the Buckinghamshire and Oxfordshire estates I succeeded by inheritance to another uncle, Major Hall. These estates had been in our family perhaps a couple of hundred years; in fact, longer than I can go back to. I may mention that I succeeded to the first, which had been purchased, because I think that is an important point as to the figures that are coming. (*See* Appendix III.) Shall I go into those figures now?

Character of estates.

34,467. I will ask you a question upon that immediately. Will you tell us the nature of the land and the purposes for which it is devoted principally?—I may say, roughly speaking, that of the 8,000 acres it is fairly good land; that is including Buckinghamshire and Oxfordshire (about which I am putting in a separate statement) which will be best illustrated by the figures I present. The total rent of the whole estate was about 12,000*l.* a year. The total gross rental at its highest rental——

34,468. Would that be about 1874?—That would be about the time that I succeeded to the Six Mile Bottom estate.

34,469. About 20 years ago?—Exactly.

34,470. But the character of the agriculture in Buckinghamshire and Oxfordshire would differ somewhat from that of Cambridgeshire?—It would. I will first deal with Cambridgeshire, and make a separate statement about Oxfordshire and Buckinghamshire, when I find it necessary to mention those other estates.

34,471. But to deal with the Cambridgeshire estates; will you give us an idea of them?—The whole of that is arable land—some of it excellent. The late Mr. James Howard, passing one of my farms, remarked to me, "Land cannot be better than this," and over the same farm I was walking with Mr. Joseph Arch, who said to me, "Mr. Hall, what do you get an acre for this?" I said, "35*s.* an acre." Mr. Arch said, "It is giving it away." That was in the year 1874—that illustrates the nature of the best of my land.

Rent.

34,472. Can you give us particulars of the rental of your Cambridgeshire estate at different periods?—I have made out here a statement covering particulars of twelve principal holdings into which it is divided containing altogether 4,810 acres of land. Would you like to have each farm?

34,473. You can give us the figures afterwards and the total now?—The rentals in 1879 of those 4,810 acres was 7,068*l.*

Reductions in rent.

34,474. That is the gross rental?—That is the gross rental. The present rental reduced, I may say finally reduced, is 4,139*l.* (*See* Appendix III.)

34,475. (*Mr. Everett.*) I think you laid emphasis on the word "finally"?—Yes, because I shall not be there if it be reduced further. I am really my own agent in Cambridgeshire, and you will see from those figures I could not remain myself if I reduced further. However, that is perhaps not very important; but I could not be a party to it because my legal and other obligations force me to reduce it no further.

34,476. (*Chairman.*) What do you mean by that—that there are charges upon that estate?—There are.

34,477. Which prevent you taking less—do you mean that you would be compelled to sell if you could not get that?—I could not in any sense of the word pay my way. It is not a very long list—would you be kind enough to look at it?

34,478. Farms rental 4,479*l.*, cottages and garden land 231*l.*, allotments, separate, 95*l.*, shooting 300*l.*;

Mr. W. H. Hall.
15 Nov. 1894.

making a total of 5,105*l.* The outgoings are tithe, 447*l.*, rates and taxes 477*l.*, insurance 77*l.*, improvement charges 1,281*l.*, schools, reading rooms, etc., 167*l.*, buildings, 324*l.* What does that mean?—New buildings.

Expenditure on improvements.

34,479. Repairs 980*l.*, miscellaneous 79*l.*, management 200*l.*; what are the improvement charges distinguished from the repairs?—Chiefly for cottages that I have been steadily building for twenty years, and buildings to an extent which was perhaps imprudent only one went on hoping against hope, and I could not bear to have disgraceful tenements on my estate—that is the literal truth. But my agent has been constantly pulling me up, and telling me I was ruining my family, which indeed I have partly done.

34,480. (*Viscount Cobham.*) Have the charges run out?—They won't substantially begin to run out before six years. I began charging in 1873, and was charged for 25 years.

Rent.

34,481. (*Chairman.*) The outgoings reach a total of 4,035*l.*, and deduct that from the income it leaves a balance of 1,000*l.*?—Exactly.

34,482. And do you charge your estates with 20,000*l.*?—That is the Cambridgeshire Estates—that is the round figure.

34,483. The 1,200*l.* is the interest on the 20,000*l.*?—Yes.

34,484. 1,281*l.* is the interest you have charged the estate with?—Yes.

34,485. (*Mr. Little.*) The interest and instalment of capital?—Yes.

34,486. (*Chairman.*) The result of these figures in 1892 is that 1,070*l.* is the nett balance of income out of 5,105*l.* received as rent?—Out of 5,600 acres.

34,487. Out of 5,105*l.* nominal gross income?—Yes, and that does not include subscriptions, or any manner of charge, except strictly estate rentcharge.

34,488. (*Mr. Little.*) Can you compare the gross and nett income from farms at different periods?—I find in 1883 my gross income was 7,258*l.* 5*s.* 2*d.*, and my outgoings then were 3,779*l.* 7*s.* 9*d.* You will observe that there is a substantial increase in the outgoings, because of building new cottages, and that accounts for the main increase in 1892, leaving a balance in 1883 of 3,478*l.* 17*s.* 5*d.* on the Cambridgeshire Estate. In 1888 the gross income—actually what I got in—was 5,551*l.* 18*s.* 5*d.*; the outgoings were 3,255*l.* 17*s.* 9*d.*; that left a balance of 2,296*l.* And now if you come to 1892 the income is 5,105*l.*; the outgoings are 4,035*l.*, leaving a balance of 1,070*l.*

34,489. The effect of that statement is that while the gross rental shows a reduction from 7,200*l.* to 5,100*l.*, about 30 per cent., the net income decreased from 3,479*l.* to 1,070*l.*?—Yes.

34,490. A decrease of 70 per cent.?—Yes.

34,491. And the expenditure you say cannot at present be reduced materially?—950*l.* odd are for repairs, you will observe. I have 167 dwelling-houses to keep in repair, and I have got between 30 and 40 sets of farm buildings. Indeed, if you take the average of my yearly outlay on my estate from income, exclusive of sums charged on the estate, I have not the slightest doubt that it would be much nearer 2,000*l.* than 1,000*l.*

34,492. (*Chairman.*) You have spent 477*l.* for rates and taxes?—Yes, on estate, exclusive of farm, account.

34,493. Is that for the whole of the property?—Only for Cambridgeshire.

Rates.

34,494. Do you pay all rates and taxes?—I do not pay my tenants' farm rates, but all the taxes direct. I began at once doing that, the income tax and land tax. The tenant is never applied to as on most estates, and that is the total amount of them in these eight parishes.

34,495. Do the tenants pay the rates upon their own farm besides?—Yes, certainly. Of course the tenant invariably pays the poor rate and usually pays the income tax, Schedule A, for his landlord.

34,496. What are the rates and taxes then?—They are mainly taxes. But I am rated on all the woods I have in hand and all the cottages, and some dwelling-houses in hand.

34,497. 477*l.* seems a very large amount?—Yes, but I assure you I have not included everything in making out the account.

34,498. I do not question it at all?—Let me roughly show you what it is. I have got my bankers' book here.

Mr. W. H. Hall.
15 Nov. 1894.

34,499. (*Mr. Little.*) Would you supply us afterwards with the particulars of that 477*l.*?—Approximately, I can tell you off-hand, the land tax is about 160*l.* of that.

34,500. (*Mr. Long.*) That would account for the extra?—Yes, in making out an account of this sort it is difficult to include everything. I have been cautious in making this out. I guarantee that there is nothing excessive in it, but there are things left out that I might have put in.

Cost of management.

34,501. (*Mr. Little.*) You have charged 200*l.* as the cost of management, about 4 per cent. on the gross rental?—Yes, I manage my Cambridgeshire estates largely myself. The Buckinghamshire and Oxfordshire estates I have a separate statement of.

34,502. Would you give us similar particulars of Buckinghamshire and Oxfordshire in the gross?—Yes, I can do that.

Rent.

34,503. The diminution of rental gross and net?—Now, for instance, you are asking me to take that sum to pieces. I see on my Buckinghamshire and Oxfordshire estates alone the land tax is 177*l.* 16*s.* on 2,500 acres of land. But that I only received this morning from my agent in Buckinghamshire, and I am prepared to hand that in and this too, but you have no right to be astonished at the amount of that 477*l.*

34,504. Have you a similar comparative statement as to the previous years with regard to the Buckinghamshire and Oxfordshire estates?—I am sorry to say that I have not. All that I can supply is the statement (*See* Appendix IV.) sent up from Buckinghamshire this morning. Those are the present rentals; but I have told you already the broad figures about it, that the rentals of the Cambridgeshire estate was 8,000*l.* a year, and the Oxfordshire and Buckinghamshire at least 4,000*l.* a year, making together 12,000*l.*

34,505. Will you give us shortly what at the present time are the reductions from gross rentals on the Buckinghamshire and Oxfordshire estates?—Here they are. The gross present rental is 2,940*l.* 2*s.* 2*d.* The estate outgoings and deductions are 1,907*l.*, leaving 1,000*l.*, so that from the two estates you get at it that I get about 1,000*l.* net from each estate, and from Buckinghamshire and Oxfordshire, which is mainly grass, I get in proportion twice as much as I get from Cambridgeshire.

Expenditure on improvements.

34,506. And in the outgoings you have the charges on the land amounting to 563*l.* 15*s.* 4*d.* a year?—Yes.

34,507. Is that principally for cottage buildings or for other improvements?—It was not principally for cottage buildings because my pastoral tenants I find do not require anything like the number of cottages, and they are more careless about those they do require.

34,508. It includes general improvements to farm buildings?—Chiefly large shedding. I have a tenant who has 900 acres of very fine grass land, and at one time I have heard he kept one head of beasts per acre, and he required and I put up at great cost enormous yards of shedding for him. That is in Buckinghamshire and Oxfordshire, whereas in Cambridgeshire it is ——

34,509. During the 20 years you have had the estates you have spent very large sums in keeping them up?—Speaking in round numbers, I have spent 50,000*l.*, of which nearly 30,000*l.* is charged, and the other was out of my own pocket. I am very much within the mark in saying that. I am perfectly certain when my income was 4,000*l.* a year I spent very nearly half of it.

34,510. If you have spent 50,000*l.* your present net rental barely represents 4 per cent. upon the sum spent in improvements in the last 20 years?—Precisely. My buildings in the Cambridgeshire estate alone are of the value of 60,000*l.* You observe that at 2 per cent. that would bring in 1,200*l.* a year, whereas my net balance was something over 1,000*l.*

34,511. Have you anything else you wish to state on this first head of the income?—I think we are now on the large farms, are we not?

Arrears of rent.

34,512. Yes?—Perhaps it would be interesting, as I held my rent audit last Tuesday, to show you the banker's receipt.

Mr. W. H. Hall.
15 Nov. 1894.

34,513. That is the rents due at Michaelmas?—No, due last Lady Day. I give eight months' credit, and in spite of that, this was all that was paid up. 1,383*l.* was the total sum paid in by the great and small tenants for the half year.

34,514. The half year being 2,500*l.* or 2,400*l.*, exclusive of the shooting?—Yes.

34,515. 2,400*l.*, out of which you get 1,300*l.*?—I did not say that I shall not get more. I will tell the Commission about how I got some of it. You see the outgoings I have got to meet. I cannot be hard upon my small tenants. I do not press them. I have got several very important tenants who keep hunters, who have shooting, and who live precisely as I do, and it was only out of two of them that I got their half year's cheque.

34,516. As a matter of fact, your largest tenants paid you most punctually?—They only paid 872*l.*, but if those two men had withheld their cheques, and I have been very liberal to them, I should have had a complete collapse. I have to pay the companies for my interest, and the clergyman for my tithe, and so on. One cannot allow oneself to be imposed upon by both great and small; but when it comes to meeting my own payments I am obliged to enforce payment from those who have the means of paying.

Labourers' cottages.

34,517. You take a great interest in the labourers' cottages on your estate?—The greatest possible interest.

34,518. Can you give us some particulars of the number of cottages that you have?—We will still keep to the Cambridgeshire estates for the present, if you please.

34,519. Yes?—I own about 140, of which I have built in Cambridgeshire about half, at a cost of 210*l.* each.

34,520. Is that an average cost?—210*l.* each cottage or 420*l.* a pair.

34,521. What is the accommodation of those cottages?—They all have three bedrooms upstairs, and two of them at least with fire-places, and a living room, a kitchen, a pantry, and so on, and in addition to that each pair of cottages has its separate offices, which might be taken for another cottage. They are very considerable buildings; they include a bakehouse in the centre common to both, which has an oven and a copper. Then it includes fuel places on either side, and in the rear they have earth-closets, to which I attach the greatest importance. I have not got an old privy on my estate to the best of my belief. At all events not one that I could get at. I have adopted the earth-closet system, which gives great satisfaction. I am adapting something better than earth, that is peat dust. That is a valuable suggestion, because it is extremely light, extremely sanitary, and extremely clean.

34,522. Do you get it from the Fens?—Well, I was asked by a person in London to take shares in a company. I told him to send me a sample of it, and I found it a most admirable invention. The next time I came to London, I am sorry to say, the whole thing had broken up, and the man had become bankrupt, no one having taken up the idea. But it is a suggestion that is of immense sanitary importance, and has great manurial value, and a great deal to recommend it in any way. I would not myself use anything else.

34,523. (*Viscount Cobham.*) Do you find that the cottagers use the earth closets properly?—I have never found any serious nuisance. I cannot say that they use much wood cinders, but they empty the pail regularly, and I supply new pails at considerable expense whenever they are required.

34,524. (*Mr. Little.*) Do you have to make a periodical inspection?—As a matter of fact, I myself, whenever I have a chance, just look round to see how the thing is going on. I am sorry to say that it is not a periodical inspection, but I tell you that never have I found a real abuse of it.

34,525. About half the cottages are new and the old cottages have been put in repair?—I have repaired all those that are in my own hands.

34,526. At considerable cost, I believe?—At very considerable cost. Sometimes at a cost amounting to half the cost of a new one.

34,527. What are the rents of your new cottages?—4*l.* a year.

34,528. Does that include the rent of the garden?—It includes 20 poles of garden. They pay extra for anything in excess of that.

34,529. Is the rent of the old cottages about the same as the new?—No, the rent of the old is 50*s.* or 52*s.*

Mr. W. H. Hall.
15 Nov. 1894.

34,530. Are they inferior in their accommodation?—Yes, decidedly. They have two and a half bedrooms; what I call the half bedroom is where there is a landing enclosed, which is used as a bedroom, so that all the old cottages on my estates have two and a half bedrooms.

34,531. Do you think it necessary that all cottages should have three bedrooms?—I do not. But you can only be on the safe side in that way; and it is a very practical suggestion, and I have tried to carry it out to get people to change their houses according as their family changes; but no power on earth will make them.

34,532. Do those 140 cottages fully supply the wants of the labourers?—Yes, fully; it is somewhat over supplied; at all events it is fully supplied.

34,533. And that is a part of your expenditure which brings in a very inadequate return?—Practically nothing at all, because of the number of widows who live rent free, and tenants who pay nothing for the cottages in their hands, and one thing with another, I am confident that I lay out as much on my cottages as they bring in, if not more; adding an extra room at one or two cottages, or putting in a new office, things that cost 30*l.* or 40*l.*, soon run away with my whole cottage rents together amounting to about on the two estates 250*l.*

34,534. There must be a great many estates where such an expenditure as you have made would be impossible?—I am an enthusiast upon cottage buildings, and I have considered it the first necessity of land owning, and I have carried it out perhaps to what is now an excess, but when I had a clear income from my estates of something like 8,000*l.* a year, or even 6,000*l.*, there seemed no imprudence in it.

34,535. Your great inducement was to bring the estate into good condition?—Yes. My income from land is now reduced to 2,000*l.* instead of 8,000*l.*—so that I am suffering from having done an imprudent thing.

Erection of cottages by Local Authority.

34,536. I think you told me some time ago that you have visited that experiment of building cottages by a Local Authority at Ixworth?—Yes; it is the only instance in Great Britain, so far as I know, of labourers cottages having been put up by a Rural Union. I thought it so extremely interesting that I went off and saw the style of houses and inquired as to the cost, and got all the particulars. Unfortunately the houses were not tenanted at the time. The cost exceeded my own by something like 150*l.* You see they have to pay for the site, whereas I have not.

34,537. (*Chairman.*) The difference was 150*l.* for the two cottages?—I mean it would bring it to at least 550*l.* for the pair. I think if you refer to the figures it is over 600*l.*

34,538. That of course includes the cost of site?—Yes.

34,539. That was heavy. They had to buy that by compulsion?—It was not very heavy. I am afraid I cannot give the exact cost, but I think it was 40*l.* an acre.

34,540. You told us the difference is 150*l.*,—the difference between the two cottages?—Yes. I am not positive that the price was 40*l.* an acre, but it was not extravagant.

34,541. (*Mr. Little.*) If the ratepayers have to charge rent which would pay even simple interest upon the expenditure that rent would be beyond what ordinary labourers pay?—I satisfied myself that for those cottages really to pay they would have to pay 8*l.* a year.

34,542. (*Chairman.*) What are they charging?—They have not settled that. I have not heard.

34,543. (*Viscount Cobham.*) They have spent a very large sum in building those cottages?—It is a curious history. I cannot make out what induced any public body to go into such an expenditure.

34,544. (*Chairman.*) Do you think that it included the cost of litigation?—I think the cost of 600*l.* would include architect's fee.

34,545. But the cost of litigation?—I do not think that they had to go to litigation.

34,546. They had some legal proceedings. They came before a Committee of the House of Commons about it?—I do not think that they went into litigation to get the ground.

Mr. W. H. Hall. 15 Nov. 1894.

34,547. (*Mr. Little.*) But the litigation was with respect to the charge—as to the preliminary charge—whether it was to be borne by the Sanitary District or the parish or the County Council?—I do not know.

34,548. (*Chairman.*) The owner, I think, opposed and put the local authority to great expense?—My impression is that no obstacle was thrown in the way by the owner. That is my impression that I got on the spot.

34,549. (*Mr. Little.*) Now we will pass to the next subject; that is allotments?—Before going to that I should like to add a few words. You see what my experience of cottage building has been compared with what my former rental was. I think it was justifiable. In fact my son remarked the other day that I had not built a cottage too much, and that is a great consolation to me; but had I succeeded to these estates in 1894 instead of 1872, with a nett income of 2,000*l.* a year to live upon and to pay all my other necessary expenses, I can only say this: that I should not have had the courage—I doubt whether I should have had the courage to build a single new cottage; and that I am afraid will be found to be the case in the future. I do not see how, with common prudence, an East Anglian landlord can invest a shilling in new cottages. Therefore this question of public bodies putting them up becomes an extremely important one, and one that is deserving of the greatest possible attention, because I think you may take it, with regard to the corn growing districts of England, as a certain fact that landlords' cottage building has come to an end at present. Of course, there are always in East Anglia and other places a certain number of people who have incomes independent of the land—I might instance Lord Cadogan and Mr. Henry McCalmont—who, fortunately, come and settle there, and spend money in a way that I did when I could afford to do it. But these, of course, are very exceptional cases; and with my experience of my neighbours I do not know a single one who has got 100*l.* at this moment to lay out on any kind of improvement whatever. The last thing I heard from my nearest neighbour was that he had put the bailiffs into the house of one of his oldest tenants, and I have no doubt it was done to prevent himself becoming bankrupt. I have told you a sorrowful tale of my own estate. And I could not live at Six Mile Bottom, if I did not let my shooting, if I had not some other means which enable me to live, and that is about all, but not to improve. Therefore it now comes to the point of public authorities building cottages, because they must be built. I have the greatest possible feeling about the necessity of providing decent lodgings for our labourers, and that cannot be done any longer out of the profits of the land.

34,550. May we go on now with the question of allotments which you have on your estate?—May I add one single remark about the public authorities. I have no doubt that they would be able to do it cheaper and more efficiently, because they would be able to borrow money—I should hope, at 3 per cent., whereas, as a landlord, one has to pay at least 5 per cent.

Allotments.

34,551. As to allotments: you were going to tell us about them?—I may say that both in the matter of cottages and allotments, I only carry on the work of my predecessor. General Hall had already built a number of those cottages that I described as having 2½ bed-rooms, and he had granted allotments of a rood in considerable numbers. When I succeeded to the estates in 1872, it was represented to me that it would be a great boon to the labourers if I granted them half an acre instead of a rood, because that would enable them to alternate straw and green crops. I did that as fast as I could. I had considerable opposition from some of my farmer tenants to get them to give up slices of land, but I succeeded eventually to the extent that at the present moment I do not know of one labourer who has not got as much allotment as he wishes, and only one or two who have thrown up their allotments the other day, which surprised me, because the allotments have been the greatest success. There is nothing to regret about that. They have been an almost unmitigated success, and everyone has got as much land as he likes—I set no limit to it.

34,552. Beyond the half acre?—Indeed I do; there are seven or eight who go up to two acres; I know of one labourer who has got seven single roods for instance, and I have seven or eight who have gone up to two acres. But those are men with two or three sons grown up, and rather exceptionally enterprising men, but I set no limit to the size. They do not, as a rule, care to go beyond an acre; I have a great many of an acre.

Mr. W. H. Hall. 15 Nov. 1894.

34,553. And what rent do you charge them?—I charge 30*s.* on one estate and 28*s.* on the other.

34,554. Inclusive of rates and fencing, if required?—Yes, and roadways, and inclusive of everything.

Arrears of rent.

34,555. Are the rents punctually paid?—I am sorry to say I cannot say that. I collect my cottage rents in October, and I give them to the 1st December to pay allotment rents to sell the barley and the pig, but I find that the pig goes on living to Christmas rather frequently and I cannot say that I get my rents punctually, but I get in nearly all sooner or later.

34,556. Are they fore rents?—No, back rents; and they come dropping in intermittently all through the year.

Restrictions on sale and cultivation.

34,557. And they are not restricted as to cultivation?—Absolutely free. I should like to add that the same freedom is granted to the larger tenants. In fact all my tenants can do what they like absolutely with the land provided they pay their rent.

34,558. With regard to the sale of produce, what do you do?—They sell some straw at Newmarket.

34,559. With conditions of bringing back the manure?—I never knew anyone who saw it come back. I do not mean to say that it does not.

34,560. It might come in the shape of artificial manure?—It might, but I do not see the effect of it, I am sorry to say. I do not press them about that.

Allotments.

34,561. Then you have a number of small holdings which you have established, I believe?—With regard to the allotments, I find I have got a note that some allotments have been lately thrown up and no rent recoverable. That is the experience of the past 18 months of serious depression. I must therefore restrict my statement that there was no black feature in it. I have to let several allotments rent free to somebody else the first year because they were so exhausted.

Effect of deterioration in farming.

34,562. Then human nature comes in in the case of allotment holders as well as farmers?—Certainly. Now we are on that subject of letting the land rent free it is a question which would have come better with regard to the large farms, but, as a matter of fact, the only terms on which I can let some of my farm land is to let the tenants have it rent free the first year.

34,663. In consequence of their bad condition?—In consequence of the bad condition in which it is left by the outgoing tenant. A great deal of it we can let at no price, and I have to farm it. That is an increasing quantity every year. About half the land that I am reletting this Michaelmas, I can only get off my hands by letting the fresh tenant have it rent free the first year.

Small holdings.

34,564. We shall come to that under the next head of farming land in hand. Will you give particulars about the small holdings on the estate?—I thought it would be interesting, and I prepared a table on the various occupations of the tenants, because I find it is essential for the small holding that the man should not be wholly dependent upon the land.

34,565. You think that it should be combined with some other pursuit?—That I believe is everybody's experience; I have put in a table of my breakdowns, my failures, that might be interesting.

34,566. (*Chairman.*) We might put in this table, and take it briefly that in every case the holder of small holdings had some other occupation?—Except two or three. Where there is no other occupation stated there is nothing but the land; that is in three or four cases.

34,567. There are three cases of two acres each. They do not live wholly by the land?—For the purpose of the small holdings it would be well to leave out those red figures because they are border land between allotments and small holdings, men with two acres and one has four.

34,568. Fifteen cases of what you call small holdings. They occupy altogether 342 acres and out of all those only three have no other occupations?—Yes, that is in Cambridgeshire. With the seven failures that would make 22. I have about established one small holding a year.

34,569. (*Mr. Little.*) How did you establish these holdings?—I gave out that I was prepared to let land in any quantities.

Mr. W. H. Hall.
15 Nov. 1894.

34,570. When you had land in hand you were prepared to let them in small quantities?—I even went the length of saying that I would advance half the capital to any labourer who had saved the other half.

34,571. And you suited the size of the occupation to his means?—I never particularly inquire as to people's means, not as a rule. I have allowed them to have the land they asked for and thought they could do. I make inquiries with regard to larger tenants, but if a man came to me and wanted three acres of land he has hardly ever gone away without it.

34,572. You have suited the size of the occupations of the tenants to the wishes of the applicants?—Yes.

34,573. Have you built for them?—Yes.

Buildings on small holdings.

34,574. What have you built on the small holdings, say a holding of 25 acres, which is the first on the list?—On the 25 acres I did not require to put any building at all—the man had a house and buildings sufficiently convenient.

34,575. Tell us the cases where you have built?—In most cases I have had to lay out sums varying from 50*l.* to 200*l.*

34,576. For how many acres—how much an acre?—I can hardly tell you that, because a man might want as much building for 10 acres as for 50.

34,577. But that has an important bearing on the question of rent, what you can afford to let the land for?—In the former days, for instance, this man with 51 acres, I laid out about 250*l.* on his buildings. He agreed to pay five per cent. on the outlay, but I have had to let him off since, and reduced his rent from 25*s.* to 15*s.* per acre besides. That is a sort of typical case.

34,578. That is only 15*s.* an acre now?—His rent is now 15*s.*, per acre, and he pays no interest on his building, and the man can hardly get on as it is.

34,579. How many acres are there in that case?—He had varying amounts. When he had most, he had 80 acres; he is now coming back to 50 acres.

34,580. That is 37*l.* 10*s.*, and you have spent 250*l.*?—I have spent 250*l.*

Condition of small holders.

34,581. A considerable charge upon the amount of rent?—Yes, at least that. Then he represented to me that 80 acres were breaking his back, and I took back the worst 30 acres; I took 10*s.* per acre of his rent off, and let him off the interest on the buildings; and if I had not, the man would not be going on still.

34,582. Tell us shortly what the result of your attempts to establish small holdings is?—I should add that, in this case, it was not suitable land. It was light sheep land; but I was eager to have some small holdings everywhere on my estate; and when this man applied for it I did not like to refuse it, and he did fairly well when he could sell his barley at 45*s.*, per quarter. Now that it has dropped to 14*s.* per quarter—only 7*s.* per coomb—he could not go on were I not to reduce his rent considerably. When I let him the 80 acres it was not a bad look out, because the man set up a flock of sheep and grew a lot of barley—he has been holding that land twenty years now—and he did for 10 or 15 years fairly well. Gradually he is going to the bad, because the difference between 45*s.*, or 40*s.*, and 14*s.* per quarter of barley speaks for itself. Barley is the product that our small holders can or cannot exist upon. It is the thing that will not keep their heads above water at 7*s.* per coomb. A man lower down in the list, who paid no rent at all, was very cheerful and confident that he was going to get a better price for his barley, of which he had 64 coombs to sell. I did not press him, but I do not share his confidence.

34,583. Tell us generally what your experience has been?—Well, my experience I might state best by numbers. There are 15 men who keep their heads above water and seven who have gone under already.

34,584. And have you been able to let the small holdings which they have vacated?—On the terms I have just told you of letting it to anyone who would take them rent free for the first year, and then perhaps paying 10*s.* or 15*s.* per acre.

34,585. Under what circumstances have you found them most successful?—Where men keep cows?

34,586. Yes?—But ours is not a cow district. One of my small farmers keeps two cows by my giving him the privilege of feeding on my ride ways and the sides of the roads. He gets six acres of grass that way.

34,587. Without payment?—Without payment; and very good grass it is. The grass by the road side is incomparably superior to any grass on the right side of the hedge. I consider the cow the only certain ladder by which a labourer can rise to a small holding in Great Britain.

34,588. But your sheep land is not particularly adapted for keeping cows?—Of course it is not. But at the same time when people wanted to try it, and in flourishing times when they were getting a good price for barley, I let them have it. I am going to make a suggestion with regard to the price of barley; because everything with regard to the spread of small holdings, or their continued existence, depends on the price of barley. A small holder cannot make much of sheep.

Comparison between large and small farms.

34,589. But your experience as an owner has not been very favourable with small holdings, not more favourable than with large holdings?—The proportion of 15 to 7 in 22 years.

34,590. What is the proportion of the larger farmers who have broken down?—The larger farmers do not absolutely break down so quickly as the small ones for this reason; farming with an indulgent landlord, if you do not distrain or press for your rent, a man may keep on for years. I have got at least one tenant who is practically bankrupt, and he pays me intermittently about half his rent about once in two years, if he has an exceptionally good year. I mean by that they can live on, deteriorating the ground, using inferior implements, inferior cattle, and living more economically; there is nothing to make bankruptcy a necessity provided that the tenant is not in any way extravagant; he can go on almost as long as the landlord will let him without being made bankrupt; but he lives upon charity, and I may say that that remark applies to the whole of my Cambridgeshire Estate, that it lives upon charity, and it applies to most of the sheep estates in the district, that they are only kept going by money spent on them, not earned by the land.

Condition of agriculture in Cambridgeshire.

Results of farming land in hand.

34,591. You have had some experience of farming personally?—Indeed, I have. Roughly speaking, I lose the balance of rent I get from my tenants in farming land in hand. The year of the drought I farmed about 1,200 acres of the worst land I have got, the lightest land. It is now—at the present price of barley—no good to anybody, but I have got to be a sort of residuary legatee of all the worst land on my estate, and the result of farming is not remunerative, so that it is literally a fact that I lose by farming what little I make by rents; and those rents are really not rent of land, because you observe the rents that I do get do not represent 2 per cent. on my building and improvements. They really do not represent 2 per cent. on the building alone.

34,592. Whereas your estate leaves you a net profit of 1,000*l.* a year, your farming absorbs the whole of that?—Happily on my estates in Buckinghamshire and Oxfordshire I am not called upon to farm, and there is more grass land, so that as a matter of fact I get my 1,000*l.* from my Buckinghamshire estates to help me to live.

34,593. How long have you been farming in Cambridgeshire?—This the tenth year.

34,594. And you have got accounts for the whole time?—Yes.

34,595. Has it always been unprofitable?—Always. I took the land which is very thin when it was disgracefully run out by the previous tenant. I would rather let a tenant off his whole rent if he left his land clean, but if he lets his land get full of weeds, as nine-tenths of our people do in the arable part of the county, I cannot stand that.

34,596. You farm with the object of making a profit; it is not experimental?—Most decidedly; I take the utmost pains to make it pay.

34,597. (*Chairman.*) I suppose you have taken this land in hand mainly for the purpose of putting it into good condition and to let it again?—No, I never intend to let it again, not if I can help it, unless prices should go up; but I took it in hand to save it from being absolutely ruined, and the land on my farm is almost the only land on the estate, I think I might say, that is fit to look at. That is one reason why it does not pay me. The rent that tenants do pay is paid by not providing labour. That is how I get any rent at all. If I did not get any rent at all how should I meet all

Mr. W. H. Hall. 15 Nov. 1894.

those burdens and obligations? You might say it is a cruel thing to get rent that is not got out of the land, but if I got no rent, I could not meet my obligations and so the whole public administration would fall to the ground.

34,598. (*Mr. Little.*) You wish to say something on the subject of burdens upon land?—Well, I think that we may revert to the balance sheet which rather startled the chairman.

Burdens on land.

34,599. The first is tithe, rates and taxes, 446*l.*?—Yes.

34,600. What are the rates and taxes?—You observe that this only refers to my estate expenditure; it does not refer to my farming expenditure. The rates on my personal farming are paid out of my pocket.

34,601. They are paid out of the farm account?—Precisely. Speaking roughly, the rates on my farms will approach at least 150*l.*

34,602. (*Chairman.*) What are the rates in the £?—They vary in each parish.

34,603. Take the average?—I must say that I do not profess to be an expert on these questions; but speaking roughly it is about 2*s.* to the best of my belief; it is extremely difficult to say.

34,604. That would represent the fair average 2*s.* in the £?—I think you may say that if you include school rate. I support my schools by separate subscriptions.

34,605. I am talking about the actual rates?—I think I had better decline to say.

34,606. You can add it to your evidence afterwards?—Take it at 2*s.* 6*d.* as near as I can say.

34,607. (*Mr. Little.*) Do you suggest any means of giving relief from those burdens?—I have already said perhaps what would prepare you for what is really the only practical suggestion that I can make; that is with regard to the barley. The success of small holdings in the corn growing districts of Great Britain I believe depends upon the price of barley. People cannot go on growing wheat. What else are they to grow? They cannot grow nothing but oats. Barley is the thing they more readily take to in Britain. The dry climate of the Eastern third of England is the most suitable district for barley growing; and the spread of small holdings, and the avoiding of bankruptcy, depends in those districts upon the price of barley. Therefore although all my life I have been a strong, at all events, consistent free trader, I see no other practical remedy than to put 5*s.* a quarter duty on barley, and to allocate it either to the unions or county councils in proportion to the arable area in their union or counties.

Duty on barley.

34,608. How do you think the grazing counties would like that, where they buy barley?—The tale that I have been telling you to-day does not apply to more than one-third of England. In the grazing counties they can very well look after themselves. If the story I have been telling you were true of more than one-fourth or one-fifth of Great Britain, the thing could not go on. It seems to me that something must be done to avoid a crash. In the eastern third of Great Britain there must be an absolute crash. The poor-rate cannot be paid; your schools cannot be kept up; your hospitals cannot be supported; your tradesmen cannot be maintained in the towns; therefore the only way that I can think of as a practical remedy without taxing the food of the people, is to tax their drink. I was told by a very experienced merchant this morning, that when the price of barley was 50*s.* a quarter, precisely the same price was charged to the labourer for his beer that is charged now.

34,609. (*Mr. Lambert.*) Then the brewers would object?—I have not the slightest doubt—you cannot propose anything that nobody would object to.

34,610. (*Chairman.*) Your proposal is that a tax of 5*s.* a quarter should be levied on barley, and that the produce should be distributed among the arable districts, among the parishes in proportion to their arable land?—Or unions.

34,611. In proportion to their arable land?—Yes, or county councils.

34,612. I suppose you are aware that a very large amount of inferior barley is imported here for cattle?—Yes.

34,613. Would you charge 5*s.* per quarter upon that?—I buy some of it myself, but in spite of that——

34,614. I mean only to get at your proposal?—My proposal is that I would tax barley in order to avoid a greater disaster.

34,615. I only want to know what the actual proposal is?—The proposal is what I stated; was not it plain enough?

Mr. W. H. Hall. 15 Nov. 1894.

34,616. Is that to include inferior barley?—I intend it to include all barleys; but I only suggest that because it is the only practical thing that I can think of. Of course I include the alleviation of burdens, for out of a farm that pays less than nothing you have to pay a heavy poor rate, and a heavy education rate; and I want a general alleviation of burdens. Mind, I would not have it taken off paying farms, but I would have the same alleviation that you get from the income tax extended to the poor rate and highway rate.

34,617. Your proposal would not do much for districts like Essex, which do not produce barley?—You never can tell; they do not now produce barley, but I rather think that more barley was produced in Essex in former days; it is because the price is so inferior that it is not cultivated now. If you could raise the price of barley, I think you would have a great deal more grown in Essex.

34,618. I think that rents have been reduced about 40 per cent. in Cambridgeshire?—Yes.

Reduction of rents.

34,619. Does that represent the reduction to individual farmers, or is that the reduction of the estate considering that you have a much larger amount now in hand?—In preparing these 12 larger farms, I may say that two of them I have in hand myself.

34,620. You have put down the rent to yourself?—The rent that I charge myself in the farming accounts.

34,621. Then it is 30 per cent. reduction on the gross?—I am not prepared to say what the percentage is.

34,622. When do you consider that this severe depression began in your district?—In 1879, I should say, was the beginning of it.

Existence of depression.

34,623. When did you last make your reductions of rent?—I have been making reductions steadily from the time that I succeeded to the Western Colville estate.

Reductions of rent.

34,624. When were the last reductions made?—This year.

34,625. Has your district suffered from two or possibly three bad seasons?—We suffered to a terrible extent last year from the drought.

The drought (1893).

34,626. Did you suffer the year before from the wet season?—My land that I farm, which I naturally know most about, does not suffer from wet, except during harvest, which happens often.

34,627. But it suffered last year severely from drought?—And this year severely from the late frost which practically half ruined both the barley and the wheat crop.

34,628. Then your district has had the misfortune of having had two very bad seasons in succession, one of severe loss from drought and this year from the late frost which cut off half the produce?—That frost was not so general as the drought, because part of my own estate suffered comparatively little, and other adjoining places suffered perhaps less. Speaking broadly, that was the cause of considerable loss this year.

34,629. This year you lost half your produce by the late frost, and there has also been a very severe fall in prices, and the two together have told very heavily upon you?—Yes.

Causes of depression

34,630. And I think you said your two larger tenants were gentlemen very much like yourself?—Except that they hunt and shoot, and I do not.

34,631. Have they been compelled to give up their hunting and shooting for the depression?—Not for a moment, because they are gentlemen of independent means.

34,632. They have independent means?—Yes; I may add that is why I insisted upon their rents was because they could afford to pay.

34,633. With regard to the wages of labourers, have they been maintained or increased, or what?—The wages were 11*s.* per week when I first succeeded to my property in 1872, they went up to 13*s.*, and now they have gone down to 10*s.*

Wages.

34,634. On your own farm?—On my farm I have reduced to 10*s.*, but on some farms they have gone down to 9*s.* and 8*s.* per week.

34,635. What is yours?—They have been reduced to 10*s.* That is the lowest weekly wage. When I say 10*s.* I give one man 12*s.* because he has been all his life on

the farm; I give another 11*s.* because he has been a great many years on the farm, so that I mention the lowest figure.

34,636. When was this reduction to 10*s.* made?—Last week.

34,637. I suppose that the labourers have benefited in your district from the low prices themselves?—Very much; that is the ground of reducing the wages to 10*s.* They gain by more than double, or nearly treble the quantity of bread now that they can buy for the same money.

Characteristics of farming.

34,638. I suppose your district is a very dry one?—That is, the thin chalk district is very dry. When you speak of my district half of my land is on the clay; only half is on the chalk; so that you see it is so extremely difficult to generalize about districts.

34,639. Is either one part or the other suitable to lay down in grass?—No. The rainfall is so small. Even on the clay my best tenants decline to lay land down to grass. One year, I only took 14½ inches, but the average is 18 inches.

34,640. Is it a district where the land can be profitably laid down in grass or not?—No, for these reasons, not because of the nature of the soil, which is heavy clay, some of it, but because you do not get enough rain, and you get frosts which check the spring feed, and we cannot turn our stock out till June, and therefore it is unsuitable for pasture, and therefore for small holdings, except as barley land.

Changes in system of cultivation.

34,641. You said you had laid down some in grass yourself?—I have, because the inferior grass that comes up to a certain extent, for a certain number of years, checks the weeds which come up twice as thick with ploughing the land up. Ploughing the land seems to do very little else than give the weeds a chance. Even poor herbage seems to check the weeds.

34,642. Land being unsuitable for grass, it is unsuitable for small holdings?—Quite so.

Small holdings.

34,643. And therefore any experiments for small holdings have been made at a disadvantage?—Not in every case. There are damp places; but speaking generally, it is so. But if you go into the Fen District on the other side of the river Cam, I rather think there are more small holdings than in any other part of England.

34,644. Is that on account of the greater moisture?—Yes, it is on the Fen land.

34,645. Where the climate is dry, and the district is not suitable for laying down in grass, the experiments in the direction of small holdings are not tried at an advantage?—Not at an advantage, and are only justifiable on social grounds. The land is suitable for small holdings because of the greater dampness. A great many cows are kept in that fen region. We have practically none. I have introduced perhaps 10 cows on my unsuitable land.

34,646. Further, your experience is that the efforts that you have made to create small holdings I think can only be held to advantage in connexion with other occupations?—Yes, in that district; and indeed Lord Tollemache's experience was the same.

34,647. And in that district it is very difficult to create small holdings in which the occupiers are to live wholly by the land?—Yes.

34,648. You have not found it possible to do so?—Only in two or three instances.

Creation of small holdings by local bodies.

34,649. Then I presume that you consider that in such districts as that, to create small holdings artificially through the county councils, or local authorities, to create a class to live wholly by the land, is not likely to succeed?—Certainly not.

34,650. Do you think it would succeed in other districts where the land is most suitable?—Yes, most certainly. I am an enthusiast upon the subject or else I should not try so many in unsuitable districts. I think that small holdings have a great future in suitable districts in this country. I do not know whether you would like to have a word about my experience of small holdings in similar districts in France.

Remedial suggestions.

34,651. I do not think we need go into France. Have you any other remedies to suggest besides a duty on barley?—A general alleviation of the burdens of farms that cannot be profitably carried on.

Assessments.

34,652. Have the assessments of the farms in your districts been reduced in proportion to the reduction of rent?—It is very little use reducing the assessment, because the parish has got to make up the same amount. That is the case with us. So that if our assessment is reduced we have to pay, instead of 1*s.*, in the £, say 2*s.* in the £.

34,653. Is there any other property, such as railways, assessed?—I am in three unions in Cambridgeshire, and I really do not know how many in Buckinghamshire, but in eight parishes in Cambridgeshire and three unions, the Newmarket union is the only one that has any other property that we need take into consideration.

34,654. What are the unions?—The Linton Union, the Chesterton union, and the Newmarket Union; I beg your pardon, the Chesterton certainly has some other property. Two out of three have other property.

34,655. In those two unions where there is other property, do they suffer from the reduction in value in the assessment?—Yes.

34,656. In those unions, have the farmers been reduced in their assessment in proportion to the reduction of rent?—I think not.

34,657. Are they not entitled to have them reduced?—You see I have reduced my rent as I said at the beginning, and the figures come to about 4,000*l.* How much of that am I likely to get? I may put that down as my rental, but it has got to be rated and taxed for practically a certain number of years, and you cannot get your assessment altered with the rapidity required to meet the facts of the case, varying each year.

34,658. As I understand the law, the assessment of land ought to be mainly in proportion to the rent?—It ought no doubt; but you see the difficulty in practice. I pay the taxes before I get my rent, and when the rent comes it is about half perhaps of my income tax assessment.

34,659. I am not talking of the income tax assessment, but the assessment for local rates. In the case of the assessment for local rates, where there is a permanent reduction of rent the tenant is entitled to claim the reduction in proportion?—As a rule your tenant is very careless. I was talking to the collector at Cambridge the other day. He says that more than half the farmers do not fill up the returns necessary to keep the machinery properly going.

34,660. Here is a case where the tenant is entitled to have a reduction of 30 per cent. on the assessment in which the rate is 2*s.* 6*d.* in the pound. It means a very considerable alleviation of the burden in those unions. Do you mean that the tenant had not applied for a reduction of the assessment?—The procedure of getting any of your assessments reduced properly, and in time, practically makes half the relief inoperative. Most farmers are more or less illiterate, and the forms are extremely difficult to fill up.

34,661. Would not it be worth while to advise them as to their rates?—I have done so; but there is no use advising a tenant without doing it for him, and often you cannot get at him. The upshot of what I have been saying is that I am more capable of filling it up than they are, and I find it extremely difficult, and practically impossible to get the relief that I am entitled to.

34,662. Have you in respect of the land in hand, had the assessment reduced?—Yes, to some, but not an adequate, extent.

34,663. In the case of the income-tax, is it not the fact if you have made no profit you are not bound to pay; or rather, you are entitled to claim a reduction?—As a matter of fact, I do get all the reduction that I can get in the particular way that it must be filled up in the form, but I find myself hampered by rent applying to one year, and taxes applying to another. You see, for instance, I shall be called upon in January next to pay about 700*l.* altogether, one way and other, for my estate in rates and taxes. Well, I shall have to pay those in advance, the tax said to be due on the 5th of April 1895, while I have to pay in January.

34,664. If for five years you have been farming 1,000 or 1,200 acres of land, and you have made no profit out of it, you are entitled, as I understand the law, to be relieved from the payment of income-tax?—About that I was misinformed until about the present year; the local people can rarely give you the latest information. I was told, for instance, with regard to remissions of

Mr. W. H. Hall. 15 Nov. 1894.

rent, that unless I made a remission of rent for three years definitely——

34,665. I am not talking of remissions of rent, but of the land in hand—your own farm—and you told us that you have for some years made no profit, and I ventured to point under under those circumstances you are not bound to pay income tax or you are entitled to get it back?—I did pay, as a matter of fact, for years, because it was too difficult, or I did not know what repayment I was entitled to.

34,666. (*Mr. Long.*) You could not get that back. It is only quite recently that you could get this back?—Yes.

34,667. (*Chairman.*) There is no doubt about the law; a man who farms his own land and makes no profit is not bound to pay income tax?—But with regard to the point of law, it is not carried out by all Assessment Committees.

34,668. I think you seem to be rather confusing the assessment of rates with the question of the income tax?—The fact is that the things in themselves are so infinitely confusing. If we had one assessment for both, then we could understand, perhaps, where we are; but when I have a farm—several farms in three or four parishes, I have one assessment for income tax and I have another for rating, and on a different basis.

34,669. (*Mr. Long.*) You assessed yourself for income tax?—But I did not get that attended to.

34,670. (*Chairman.*) I would merely suggest to you that you should be fully advised what your rates are, because it is a pity to pay income-tax for several years when you are not under any liability?—You may be perfectly sure that if I did it, I am not an exception, because of the difficulty of the thing. The whole question of rating and taxing is so infinitely complicated, that if in 15 parishes I endeavour to set the whole thing right I should not have any spare time at all.

Reductions of rent.

34,671. (*Lord Rendel.*) Your reductions of rent have been permanent, have they not?—They have been on an increasing scale. I have given temporary remissions, and permanent reductions. Now the figures that I have put in are permanent.

34,672. But throughout the tenants have been in a position to claim the benefit of the reductions in regard to their assessments?—Not in the case of temporary remissions, as far as I have been advised, because I was distinctly told that no reduction could be made unless given for a distinct period of three years; but that was false information, it seems.

34,673. The general inference is, that you have reduced about 30 per cent. of your own total rental?—At least that.

34,674. And that reduction is a permanent reduction?—Yes.

34,675. And to that extent your tenants might have availed themselves of the advantage in the assessment?—It is only done permanently and finally at this Michaelmas 1894, and that practically applies to the rents that they pay eight months hence.

34,676. You do not consider that you form an exception to the general rule on the East Anglian estates as to the failure of tenants to take advantage in regard to rating or assessment owing to the reduction of your rent?—Certainly not. I may observe that I do not offer this as a subject to be examined upon, I prefer to confine myself to things that I understand, and I am not prepared to be examined on this question. The the whole question is so complicated for farms and estates such as mine are in 15 parishes. I am myself often both owner and tenant; and then the tenant pays at a different rate to what you do as owner. One must be an expert to unravel the complications of such a muddle as the incidence of rural burdens.

34,677. But your experience of those similarly placed, with the difficulty of elucidating this question, leads you to a very considerable unnecessary loss?—Rather than be worried from morning till night you submit to pay about twice what you could be called upon strictly to pay.

Assessment to local rates.

34,678. And as a remedy, so far as it goes, you would welcome a simplification of the machinery?—I should welcome the taxing and rating assessment being the same. You must see how complicated it is when it is totally different, and calculated on several different principles. That is a suggestion I intended to make to enable owners and occupiers to get the advantage. The thing could be made simple enough to enable them to get it without wasting half their time.

Mr. W. H. Hall. 15 Nov. 1894.

Cottages.

34,679. I think, passing to another subject, you stated you had 140 cottages in your Cambridge estate?—Yes.

34,680. And that half had been built by yourself?—Not quite half; I think between 60 and 70.

34,681. For the newer cottages the rent was about 80*s.*?—The rent is 4*l.*

34,682. And for the older cottages of the inferior kind the rent was something like 50*s.* or 52*s.*?—Yes.

34,683. Do you let cottages with your farms to any extent?—Yes, I let about a third of them. The cottages that are detached on the land away from the villages that are practically almost part of the farm building, I let with the farm.

34,684. With regard to the cottages which let with the farm, have you reason to believe that the farming tenant charges more than 1*s.* 6*d.* per week, or 1*s.* per week?—I think he generally deducts 1*s.* a week from the wages.

34,685. One shilling a week in the inferior and 1*s.* 6*d.* in the better class of house?—I rather think 1*s.* for both classes of cottage.

Wages.

34,686. And therefore when you give the wages as 11*s.* and now 10*s.*, that is subject to a reduction of not more than 1*s.* or 1*s.* 6*d.* for the house?—Yes.

Cottages.

34,687. Is 1*s.* or 1*s.* 6*d.* above the average rent payable by agricultural labourers for their cottages in your district?—Yes, I think 1*s.* 6*d.* a week. I should think probably 3*l.* a year the average between my superior cottages and the old cottages. If my cottages belonged to anyone else they would be no doubt charged 6*l.*

34,688. You are of opinion with your views as to the necessary character of the housing of the agricultural labourers, it is impossible that that rental can be remunerative?—Absolutely impossible.

34,689. To that extent, to the extent of the difference between the economical rent, and the actual rent, the wage of the district must be benefited?—I stated if I got 4*l.* nominally for a new house, that the result of my cottages altogether is, that I get no net rental from my cottages at all, what with the repairs, and the necessity of painting, and one thing and another, it simply swallows up the rents that I get. I explained that they did not all pay rent, as there are a certain number of people living rent free, widows and others.

34,690. In fact the labour of the district has largely the advantage of extremely cheap accommodation?—On my estate it has.

34,691. But not, as far as you know, in the district generally?—There is a great need for it.

34,692. (*Mr. Long.*) Do you desire to put before the Commission that your district is specially favoured with regard to the cottages from the lowness of the rents?—I do not desire to put anything before the Commission, but simply to state the facts of the case.

34,693. Have you compared houses in Cambridgeshire with other parts of the country, with the rents of your own?—I cannot say I have. My impression is, if you want that, that the rate in East Anglia generally is for an old cottage 1*s.* per week and 1*s.* 6*d.* per week for a new cottage.

34,694. (*Lord Rendel.*) You have therefore the coincidence of unremunerative rents of cottages in districts which are peculiarly suffering from agricultural depression?—Certainly.

34,695. That applies to your district, and may probably apply to many other districts in the same circumstances?—From my general acquaintance with East Anglia that is so.

34,696. (*Mr. Long.*) Are not the rents practically the same in every agricultural district of the country as you have told us in Cambridgeshire?—I cannot say positively, though I am inclined to believe it is so. I can state this from my observation in travelling about, that my cottages are exceptionally good; when I go about I do not see commonly such a provision of cottages.

34,697. (*Mr. Elton.*) Just one question as to the cottages not being remunerative, I think you have about 94 cottages in your own hands. What was the gross number?—140 cottages.

Mr. W. H. Hall.
15 Nov. 1894.

34,698. And half belonged to the farmers?—I think I said a fourth; I cannot speak with confidence.

34,699. Say it is 80 or 90 you have got in your own hands?—Yes.

34,700. And some of these were for pensioners, you said; you said that they were unremunerative, that is as a cottage built for an investment?—Yes.

34,701. How about the idea of a cottage for stocking the estate, or improving a neighbourhood; would you call it unremunerative because it was not remunerative *quâ* cottage?—It is a remunerative cottage socially; and if you ask me that question I may say that I am perfectly astonished to see the change in the habits of some of the cottagers going from the old into the new ones. I am amply remunerated in that respect, but not financially.

34,702. Might it not be remunerative to an estate to have the necessary accommodation for labourers but yet *quâ* labourers paying such rent it would be unremunerative from them if that was your only property. Is not the usual way to build cottages on an estate which would be unremunerative by themselves, but might improve your estate because you want cottages. Is that your experience?—I really can only say financially unremunerative. They are quite remunerative in other senses; but I do not think it is quite a fair use to give to the word, because remunerative seems to suggest finance, money, does not it?

34,703. That was what I was trying to bring out—that is what you were answering about?—I should rather put it in this way that it is financially unremunerative but morally remunerative.

34,704. Why do you call it financially unremunerative if it might be remunerative to the whole estate. Why insist upon treating the cottages as an investment *per se* by bringing in the question of the remuneration of the cottage if it benefits the estate?—It does benefit it morally, but not financially. I have no other answer to give.

34,705. Let us take a 'non-moral' farmer or landowner; he has got an estate, and he wants cottages to enable him to work that estate?—But he would not build new cottages.

34,706. (*Chairman.*) Take the instance of a man who has not got enough cottages, and without any philanthropic regard he builds cottages for the purpose of improving his estates?—I say that he would not—that is in my experience.

34,707. (*Viscount Cobham.*) If you had not built the cottages would the rents have been much lower than they are?—I do not think that they would. Mr. Elton did not put it quite fairly because things are done from moral and financial motives, and if I had been guided by the sole object of the improvement of my estate, I should certainly not have laid out one-third of the money—the cottages that were there would have done for many years for the financial position of the estate.

34,708. (*Mr. Elton.*) I see the mistake. I had not your case in mind; I was speaking generally of cottages as to their being unremunerative, and I took it from a totally abstract neighbourhood. A person must have cottages if he wants to keep up his estate?—No, he must not; his labour may be got from outside.

34,709. You could not admit that there is such a case that a man would build cottages to improve his estate?—I do not go that length.

34,710. Let us take that case; and let us ask a very simple question, which is: May not those cottages be an improvement to the estate where, if regarded as a building investment by themselves, they would bring in less than the carpenter's bill for repairs?—Certainly it may be regarded as an improvement, but that is a different thing to a remunerative outlay.

Settled Estates Act.

34,711. About the limited owners' charges for improvements which are so heavy. Do people in your neighbourhood that you know apply settled money or anything of that sort under the Lands Act to get rid of those charges?—No. I have laid out considerable sums under the Settled Estates Act. For the last few years I have spent what is called capital money on these improvements.

34,712. One question on that. Do you find it a relief that the law now allows capital money to be applied for redeeming the limited owners' charges?—I did not say I had redeemed charges. I said that I had applied the capital money to fresh improvements instead of borrowing.

Mr. W. H. Hall.
15 Nov. 1894.

34,713. I said do you know that by the law the capital moneys can be applied to redemption of those charges?—I have not been able to apply it to the redemption of those charges. My solicitors have advised me that it could not be remuneratively done.

34,714. Has it struck any of your neighbours that they would reduce the amount perhaps from 5 to 3 per cent. by doing it?—Very few of my neighbours have borrowed money—in fact I am about the only one. I beg your pardon if I misunderstand what you are driving at. But this is a point worth consideration: since the Act was passed I have left off borrowing from the Improvement Companies and I have spent capital money on the improvements.

34,715. But supposing there are charges, which of course of late years there are a great many, owing to a very recent Act, the capital money can be applied in redeeming the charges?—My solicitors and agents have advised me that in most cases it could not be profitably done.

34,716. (*Viscount Cobham.*) In fact the lenders of the money under Land Improvements Acts will never allow redemption—at least they put great difficulties in the way?—Yes, they put difficulties in the way.

34,717. (*Mr. Elton.*) The question to which I was leading, which is the practical one to us, is this: Supposing that other people can generally apply capital money towards redemption of those charges, would it be advantageous for estate moneys to be lent for the purpose of such redemption?—I think it very likely might; but how could I give any other answer when in my own case I was told it could not be done.

34,718. You have not considered it?—My solicitors have considered it. Those charges are a terrible burden to me.

34,719. Of course the great trouble a year or two ago was this. The tenant-for-life's interest and the remainder-man's interest had to be apportioned in a very complicated and injurious way; and now it is very much simpler, but you have not made use of it?—I wanted to; and I think it would be a great practical convenience to allow borrowing further without having to pay those extravagant rates.

34,720. You will find that of real use?—I may find it of real use.

Profits of farming.

34,721. (*Mr. Everett.*) I understood you to say that the land you farm yourself, and so far as you can judge of what you see that of your own tenants too is not paying anything to the farmer—it is not being farmed at any profit now?—Not by the ordinary farmer. A man must be an exceptional man or have some exceptional product either in stock or in grain to make money. The ordinary farmer of arable land may be taken to make no honest profit at all—I can call it dishonest to maltreat the land. I do not see that the farmers are to blame; for the money has got to be raised to support public institutions.

34,722. I think it follows from that that low as the wages are that are paid to the men, a good deal of that money is not paid out of the earnings of the land, but either out of the capital of the farmer or out of the deterioration of the soil itself; it is not a living wage to those who pay it?—Certainly not. I go on farming mainly to provide for my labourers, to avoid cutting them adrift.

Reduction in labour.

34,723. Looking at that state of things, is it not highly probable that the sphere of employment of the labourers will a good deal diminish in the next few years?—It is certain; and not only farm labourers, but bricklayer's labourers, carpenters' assistants, or gardeners, every sort of labourer will be thrown out of employment from want of anyone having money to employ them.

34,724. In fact, I understood you to believe that unless prices mend and, still more, if prices still continue to descend, we shall soon have a general crash in the eastern counties?—Most certainly, I consider that absolutely certain.

34,725. We have heard in some evidence which has been laid before us that if we make a change in our standard it will be followed by a crash, but in your view we are going towards a crash now?—In the corn-growing districts, and especially in East Anglia, because there are corn-growing districts in the north in populous places and in the proximity of great markets where arable farming is less ruinous.

Mr. W. H. Hall. 15 Nov. 1894.

34,726. The Chairman questioned you a great deal about getting the assessments reduced on farms. Now in districts where farms are nearly the only property assessed, if those farms which have been got into a very bad state are relieved of their rates, would not that swell the burden on the remaining farms and drive them out of cultivation too?—That is why I made the suggestion that there should be some outside aid from unions.

Tithe.

34,727. (*Mr. Dalton.*) What is the average amount of the tithe per acre on your estate; do you know at all how many shillings?—Only a comparatively small part of my estate is subject to tithe.

34,728. Has it been redeemed in the other places?—I suppose so. Most clergymen are supported by glebe; but, as a matter of fact, my tithe varies from 2*s.* 6*d.* to 5*s.*, or 4*s.* 9*d.*; it used to be 6*s.*

34,729. (*Mr. Little.*) The tithe owner in many parishes has been compensated by land in lieu of tithe under the Enclosure Act, is not that so?—Yes. I might say that the clergy are more supported by glebe than tithe on my estate.

Rates.

34,730. (*Mr. Dalton.*) Are your rates higher than they used to be or lower?—Will you excuse me, my impression is that the old rates are not higher, but the education rate, for instance, is an addition. I should think on the whole, if you add the education rate, that they are rather higher than lower, if you take the total of the rates.

34,731. But you have no positive information?—I would rather not say.

Price of straw.

34,732. Do you get a good price for straw in your neighbourhood?—My tenants I presume do, or they would not sell it. I have never sold any myself, but my tenants get a good price at Newmarket, some of them; by good price I mean 2*l.* to 50*s.* per ton.

34,733. You cannot say to what extent the rise in the value of our straw has compensated for the fall in the value of the wheat?—To a small extent I have no tenant who grows straw for the purpose of selling it, and none that send it to London They only take advantage of the Newmarket racing stables, which is a limited market.

Reduction in rents.

34,734. (*Viscount Cobham.*) Does the reduction of rent on your estate represent pretty fairly the reduction throughout the neighbourhood?—I think the reduction in the neighbourhood has been in excess of my own. My estate has generally speaking much better buildings, better farmhouses, and better general accommodation than my neighbours; and I believe that is more the reason why my tenants stay with me and pay a higher rent than they would to some others.

34,735. You have treated them with almost excessive liberality?—I have made it more desirable for them to stay. As to the deductions mine is certainly one of the least reduced estates, I should say, in my neighbourhood.

Restrictions on farming.

34,736. And you allow them to farm precisely as they please?—Practically.

34,737. And you are practically keeping on many bankrupt tenants?—I will not say many. I have but once distrained in 22 years, and that was one tenant, not because he did not pay his rent, but because he was——

34,738. But still you say you have several tenants who pay a fraction only of their rent once in two years?—I have at least one large farmer and several small ones.

34,739. And you give for your rents eight months' credit?—Yes.

34,740. How long has that been the practice?—I used to have an audit before Christmas, and my tenants asked to put it off till after Christmas, so that they might have the benefit of the markets; and then my personal convenience came in, and it has kept on. I am not going to defend it as a good system.

Deterioration in farming.

34,741. And you have every reason to believe that the soil of your property is being considerably deteriorated?—I am certain of it.

34,742. I am afraid that the prospects of your estate do not point to any improvement in its circumstances?—I see no bright spot whatsoever in the future—I could not expect a crash if I did. If people were logical, and land had been on a commercial footing in this country, half the farmers would be declared bankrupt at this moment, but they are not; they just escape being declared bankrupt; and I think that might be fairly said to apply to one-half of the tenants in East Anglia.

Mr. W. H. Hall. 15 Nov. 1894.

Management of estate.

34,743. The system of managing the estate which you have described has been forced upon you; it is not the system you would adopt if you could help it; for instance, the eight months' credit?—I am not prepared to say that that is the right thing to do.

34,744. But, in fact, you are managing from hand to mouth?—Just to show I am not a careless landlord, I have had several farms reported upon by land agents as to the state of them. Although indulgent, I am not careless; in fact, I am strict; I try to remedy the situation. I had reports from agents, but I have utterly failed to put a stop to the thing. Now I may just mention on that point the other day I was crossing the farm of one of my tenants and I could hardly see the turnips for the weeds growing there. I did not go to the tenant and complain of that, but I happened to meet him, and I said, "I hope I shall not see so "many weeds on your land"; I said it rather in a chaffing way, not as a serious complaint. The next day there reached me a letter to the effect that it was bad enough to be losing money on my estate, and then to be insulted like that about his weeds. In this tenant's case I have reduced his rent from 30*s.* to 15*s.* You see I am not a careless person about weeds.

34,745. (*Mr. Everett.*) And you have a few instances like that?—Yes.

Allotments.

34,746. (*Viscount Cobham.*) On the question of allotments, are they mostly taken by agricultural labourers, pure and simple?—Yes. Tradesmen who do not apply for small holdings take two or three acres, something between an allotment and a small holding.

34,747. Do the greater number of the agricultural labourers on your estate take allotments?—Yes, I only know two or three who do not.

34,748. Do they make it pay commercially speaking?—I have no doubt whatever that they do. I do not quite like your word "commercial." It pays them as consuming everything on the spot, and not paying anything for carriage. It works in with pig keeping.

34,749. With the present prices and charging for their labour could they show a balance sheet in their favour?—I think so; they grow greens, potatoes, and nearly all the labourers keep pigs, and they all grow barley to feed the pig, and straw to put under it.

34,750. When do they do their work on those allotments; after their work on the farms is done?—Yes, they as a rule do it after the work on the farms. I have no doubt whatever that the allotment pays them admirably. I should say that it would not be putting it too high to say that the allotment is worth 8*l.* at least, and I might go up to 10*l.* a year, for the produce of an acre.

34,751. Are they assisted in any way by yourself or the farmers?—Not as a rule.

34,752. Do they get any ploughing done for them?—Not as a rule. When a man has a whole acre he sometimes gets it ploughed; if he has two acres, he always gets it ploughed.

34,753. Are not the holders of allotments apt to become mere jobbing labourers so as to have more command of their time?—If they did that would apply to the whole of my estate; where there are two or three acres he is practically a jobber, but that does not create any difficulty.

34,754. The farmers would not regard that with satisfaction if that was the case?—No.

34,755. (*Mr. Little.*) Where do they keep the pigs?—They generally put up some sort of stye for themselves.

34,756. On the allotments?—More often at the bottom of a garden, because they have a garden as well as an allotment.

Results of farming.

34,757. (*Viscount Cobham.*) I do not think you have given any details as to the result of your farming?—I am afraid I told you that I lost about 1*l.* an acre.

34,758. Is that one year with another? Have you got any figures during the last four years?—My loss last year was about 1,200*l.*, and this year it came out exactly the same; that is, taking one year with another, you could not put it at less than 1*l.* an acre; but I farm the worst land I have, the thin land.

34,759. (*Mr. Little.*) If you charged yourself no rent you would still be out of pocket?—I should. I charge

Mr W. H. Hall. 15 Nov. 1894.

myself a very low rent. I charge 10*s.* for a portion and 15*s.* for another portion, and I have never made it.

34,760. (*Viscount Cobham.*) Are the last two years typical years?—No. You can hardly have a good year for farming that land, but I quite recollect three really bad ones. 1887 was a year of drought, almost as bad as 1893.

34,761. The whole loss over a series of years was 1*l.* an acre per annum?—That does not mean I have to pay 1*l.* out of pocket. I do not make my rent or my tithe, or interest on my capital; and I do not make my rates, and I have some out of pocket loss besides. That does not mean that each year I have got to put 1,000*l.* into the farm to fill up the gap.

Mr. W. H. Hall. 15 Nov. 1894.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Sixty-third Day.

Friday, 16th November 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. BARON RENDEL.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant Secretaries.*
ALAN MACKINNON, Esq. }

Mr. R. STRATTON called and examined.

Mr. R. Stratton. 16 Nov. 1894.

34,762. (*Chairman.*) You are a tenant farmer residing at Duffryn, Newport, Monmouthshire?—Yes.

34,763. How long have you farmed in that disirict?—Since 1865.

34,764. What is the size of the farm?—My farm at Duffryn is about 800 acres; I also occupy another farm near Portskewett of about 700 acres, and another hill-farm between Chepstow and Usk, something over 400 acres, and I am half owner and occupier of an estate in Gloucestershire of 1,200 acres under cultivation.

34,765. Under your own cultivation?—Yes.

Description of district.

34,766. Then the district in your neighbourhood consists of four classes between Cardiff and Chepstow?—Yes, I have classified them in that way.

34,767. Will you state what they are?—In the first place there is a belt of grass land running from Cardiff to Chepstow and running on again; of course up to Gloucester it is deep alluvial land, all grass. This is naturally very good land and is farmed generally speaking by graziers, dairymen, and hay growers; and I may say at once that the farmers occupying that land have maintained their position very fairly well, and that though of course that land has deteriorated in valuc to some extent it still lets readily and sells readily.

Reduction of rent.

34,768. What has been the reduction of rent upon that land?—It varies considerably, but I should say the general reduction of that grass land does not amount to more than 10 or 12 per cent.

Cheese-making.

34,769. Then the farmers of that land have done fairly well?—They have done fairly well. There is a considerable amount of dairying upon that district. The specialty of this dairying is what they call "Caerphilly cheese"; it is a soft thin cheese which goes to the market very quickly, and is readily bought by the miners, the colliers, and so on. There is room for great improvement with it.

34,770. It is not a high quality of cheese?—It is not a high quality of cheese; there is no uniformity of goodness about it; some of it is very good and a great deal of it very bad.

34,771. It is capable of considerable improvement?—It is capable of improvement. We are hoping that there will be some improvement under a system of technical education they are adopting in our county.

34,772. Is there any attempt at co-operative management?—No, nothing of the sort.

Mr. R. Stratton. 16 Nov. 1894.

34,773. Would it be capable of improvement in that direction by that method of co-operation?—Do you mean the factory system?

34,774. Yes?—I think this is a kind of cheese which can be made quite as well in a farm-house as in a factory. In fact factory cheese as a rule is a low quality of cheese in my opinion.

34,775. What extent is that district compared with the others?—It is running something like 30 miles, and it varies in width from a mile to four miles. The exact number of acres I do not know.

34,776. Is it about one-fourth of the district you are describing?—Not nearly so much; probably nearly a tenth, but it is the cream of our county.

Description of district.

34,777. Then the next district?—The next district is one adjoining this, and situated principally upon rising ground on the old red sandstone and limestone formation. There is a considerable portion of arable land on this, and rather nice upland pasture. On the arable portion it is peculiarly suitable for barley and sheep, what you may call "rotation farming," and the farmers of that district have held their position very fairly well. Barley has been a great speciality, especially in the Chepstow and Portskewett district—perhaps one of the best barley districts in the country.

Reduction of rent.

34,778. Then in this district also the farmers have maintained their position fairly well?—Fairly well. There have been reductions of rent of course.

34,779. What reduction?—It has varied pretty much in proportion to the arable land, but I should say that that district generally has been reduced something like 15 per cent.

34,780. And with that reduction does the land let easily?—Yes; there is no land in the landlords' hands, and when farms come into the market they are re-let, often, of course, at a reduction.

34,781. Does land sell readily when in the market?—It sells fairly readily.

34,782. What kind of number of years' purchase is it?—About 27 or 28 years' purchase.

Barley-growing.

34,783. Not much reduction in the number of years as compared with a few years ago?—No. Of course, at the present moment, owing to the fall in grain, our speciality in barley seems to be somewhat at a discount. For instance, one of my farms is situated at Chepstow, a district which is peculiarly fitted for good barley. When I took that farm I recollect a 50 acre field of barley made 60*l.*; the same field this year, and just about the same crop (five quarters per acre) will make 35*l.*; the former crop made 48*s.* per quarter.

34,784. The very low price of barley is against that district?—Yes.

34,785. But apart from this year the farmers have done fairly well?—Yes, in that district; last year of course they lost money.

34,786. Is there any dairying in that district?—Yes, a certain amount of dairying.

Land laid down to grass.

34,787. Is there any land laid down to grass?—A very considerable portion is laid down. All the poorer portions have gone down, also the heaviest portion, that is, the least easily cultivated.

34,788. Does it lay down in fair grass or not?—Very fair grass.

34,789. How soon does it come to value?—It depends entirely upon the treatment. If properly treated it comes into value immediately and continues so. A large majority of land which I have laid down to grass, has given me, I may say, every satisfaction. If I had not done as I did—laid a quantity of it down as soon as I saw what was coming—I should have been in a worse position than I am in at present.

34,790. What do you consider it costs to lay down per acre?—Well, I have never been an advocate for expensive seeding or laying down. My seeding has never cost more than 12*s.* per acre.

34,791. (*Mr. Lambert.*) Permanent seeding?—Yes.

34,792. (*Chairman.*) Do you feed sheep with cake upon it heavily so as to improve it rapidly?—Yes, and I manure it occasionally.

34,793. Feed the cattle and sheep with cake?—Yes, and sometimes roots, and I feed them so in winter.

34,794. It is not a costly process in your district to lay down grass?—No, not on this particular land.

34,795. (*Mr. Little.*) Principally rye-grass?—I use some rye-grass, and some cocksfoot, and timothy and clover.

34,796. (*Chairman.*) Is there permanent grass?—I am speaking now of permanent grass.

Description of district.

34,797. What is the third district?—There is a third district of inferior land with a strong dash of clay in it. This is very poor land, and a good deal of what was arable on this kind of land has gone down to grass. A good deal of it is somewhat poor grass. It has a rather poor class of tenantry upon it. Very little money has been spent with a view to making this poor grass into good grass, and even if it were spent upon it the probability is that a good deal of it would be wasted. It is naturally poor land.

34,798. What did it grow?—Wheat to a certain extent, and oats occasionally, and occasionally roots. Arable was always in a small proportion to the amount of grass on the holding, but that small proportion has grown very much smaller.

34,799. Is this poor soil as compared with the others?—Yes, altogether poor as compared with the others.

34,800. What proportion of the district is this, one-fourth or what?—Well, it is rather a large district, running from the River Rhymney up to the northern part of the county before we come to the hills; that is to say, 25 miles. And then again, in another direction—I am speaking of the high ground between Newport and Monmouth.

34,801. Is that farmed generally by small farmers?—Principally by small farmers.

34,802. Without much capital?—Without very much capital.

34,803. And they have hardly done justice to the land in laying it down?—Frequently not.

Reduction of rent.

34,804. What has been the reduction of rent upon this land?—Generally speaking about 15 per cent.

34,805. Not more than that?—I do not think more than that.

34,806. Still they let it with that reduction?—They are pretty nearly all let.

Mr. R. Stratton.
16 Nov. 1894.

34,807. When the farms become vacant are there applicants for them?—Yes, there are.

34,808. And does the land sell?—There is not much selling in the district.

34,809. But it is let with the reduction of 15 per cent.?—I think it has been doing so, about that.

34,810. (*Mr. Little.*) What is the rent?—They vary very much, from 5*s.* to 15*s.* per acre.

34,811. (*Chairman.*) It is rather a low rented land?—It is rather a low class of land.

Tithe.

34,812. (*Mr. Everett.*) What is the tithe?—The tithe on that land would be probably 3*s.* 6*d.* per acre.

34,813. (*Chairman.*) But in speaking of the rent you include that?—When I was speaking of 5*s.* I was not contemplating tithe; it would probably make 8*s.* to 18*s.* including tithe.

Description of district.

34,814. Then we come to the last district; what do you say about that?—These are small enclosures abutting on the hills, and for the most part the occupiers have a run on the mountain for their sheep and cattle, as the case may be. I think they have held their position perhaps as well as any class of farmer in the county. Of course their life is a hard one, and they live very economically; they work hard and they do not aim to save much money; if they can make a living, and a rough living, they are fairly well content, and that remark applies to the former class of farmers.

34,815. What sized holdings have they?—They vary very considerably, but, generally speaking, they are rather small, I should say 100 acres would be an average.

34,816. And then besides that, they have the run of the hills for a considerable number of sheep or cattle?—Yes.

34,817. And what does 100 acres consist of, is part of it arable?—A very small proportion would be.

34,818. Is it mostly grass?—They sometimes keep one plot, five acres out of 100, in arable, just to grow potatoes, oats, and a few roots.

34,819. Is there any recognised stint of the cattle so turned out as to what they can feed?—There is a recognised stint.

34,820. Is that kept to?—I think so.

34,821. Do the small holders not have some advantage over the large ones?—I do not know that they have. If a man is very persistent I daresay he might have an advantage.

34,822. And turn out a larger proportion to their quantity of land?—There are certain complaints of that kind, but, generally speaking, things work fairly well.

34,823. And in these cases has the rent been maintained?—Yes, as well maintained as any part of the county.

34,824. Is it mainly devoted to sheep or cattle?—Mainly sheep.

34,825. In spite of the fall in prices the rents have been maintained?—Yes, the fall in prices in sheep has not been so excessive as in other things, you will observe.

Result of farming.

34,826. Then what is your own land mainly in, the first and second?—The first and second class, about 1,500 in those two classes.

34,827. Have you found in the first class of land that you have done fairly well?—I have just managed to hold my own, but for the last 10 or 15 years I may say nothing more.

34,828. You have made moderate interest upon your capital?—I consider that I have made a living and nothing more.

34,829. (*Mr. Everett.*) And is your capital intact?—I consider so, it was not last year, I think it might be this year.

Value of stock.

34,830. (*Chairman.*) Your cattle have somewhat depreciated in value owing to the fall in prices?—I thought so last year, very much so; but the price of stock having gone up this year, if I go into the values I shall be in a better position.

Mr. R. Stratton. 16 Nov. 1894.

34,831. Has the stock gone up as much as it fell last year?—Sheep have gone up about as much as they fell last year.

34,832. Of course the fall last year was due to the drought in England?—To a great extent.

34,833. And that led to a great diminution of the stock?—Quite so.

34,834. This year the stock is not adequate for the feed, and therefore the price has gone up again?—Especially for sheep and store cattle, the latter have gone up for a certain time, and they have gone back, and are selling exceedingly badly at the present time.

34,835. What is the cause of that?—The very low price of beef which of course is crowding in from America. Also the low price of corn. There is no money realised by the farmers for the corn to invest in stock, so that at the end of the harvest the farmers expect to thrash some corn, and convert that corn into money, and put it into stock; but this year corn is simply unsaleable.

34,836. But apparently, from what you say, comparatively little wheat is grown in the country?—Very little, but other kinds of corn is grown almost in the same proportion as wheat. Of course the price of stock does not depend upon the price of corn in our county.

34,387. Do you buy any feeding stuffs?—I buy largely.

34,838. And the low price tells in your favour there?—Certainly, from a stock point of view.

Sale and purchase of corn and feeding stuffs.

34,839. Do you buy as much as you sell of corn and feeding stuffs?—I think about as much—very nearly about as much—I am speaking now of Monmouthshire.

34,840. Is that generally the case in your district, that farmers buy as much as they sell?—I say not.

34,841. Do they sell more?—They sell more; it depends entirely upon the nature of the farm; the proportion of arable to grass.

34,842. Then you have laid down rather more grass in proportion than other farms in the district?—I think I have.

34,843. Perhaps you would say a word with regard to tenant farmers. You say in your brief that they are free generally from hampering conditions and sell the produce?—Yes.

Condition of farmers.

34,844. Then you have the two markets in close proximity and the railway rates are saved in consequence?—Yes, I attribute what I may term a comparatively satisfactory condition of agriculture in our county principally to the fact that we are free from all hampering conditions with regard to farming, in the first place, and selling; and, secondly, that we are in close proximity to good markets which we avail ourselves of for all kinds of produce.

Wages.

34,845. Then with regard to the labourers, have the wages been maintained?—Yes.

34,846. Or have they increased as compared with 30 years ago?—They are fully maintained; generally speaking there has been an increase certainly during the last 20 years. I am bound to say that in my own case there is very little increase per day in the last 20 years; but I think I am in a rather exceptional position. When I took to the place wages were very high. I have a considerable milk trade, and milkers have always been rather highly paid class of labour. It was so when I took the place, and it is so now, but wages have not gone up more than 1*s.* per week in my own case.

34,847. What are they?—I pay the milkers 15*s.* a week and a house.

34,848. Rent free?—A house rent free and a garden.

34,849. For an ordinary labourer, how much?—13*s.* a week.

34,850. Without a house, I suppose—I mean paying rent for his house?—That would be with a house rent free. The ordinary agricultural wages would be 2*s.* 6*d.* a day. If you want a man for the summer you would have to pay 2*s.* 6*d.* per day; and allow them beer money in hay-making and harvest extra.

34,851. That is ordinary labourers, not milkers,—have their wages gone up somewhat?—Yes, I should say they had until lately; perhaps during the last two years there has been rather a tendency the other way.

34,852. What was the rise, 2*s.* a week?—I think so.

Mr. R. Stratton. 16 Nov. 1894.

34,853. And now there is rather a tendency to fall you say?—Yes, in fact, there is not the demand for labour.

34,854. (*Mr. Giffen.*) Since what time do you count the rise?—I am speaking now of the last 20 years.

34,855. (*Chairman.*) I suppose the rise occurred first about 1873 when agricultural labourers' wages rose very much?—I should go back further than that—I should say from 1861 there was a general tendency to rise.

34,856. (*Mr. Whitehead.*) Has the contiguity to collieries affected your wages a great deal?—Yes, the high price of labour in the towns which, of course, is kept up by the unions undoubtedly must affect the keeping up of the price of agricultural labourers' wages.

Employment of labour.

34,857. (*Chairman.*) The small farmers that live on the hill sides, I suppose, do not employ much labour?—Very little.

34,858. The small farmers in the various districts who rather farm more arable land, do they employ much labour?—No.

34,859. The labourers mainly are confined to the two better districts that you speak of?—Yes, the extra labour, and in the summer time they get men out from the towns for haymaking and harvest.

Condition of labourers.

34,860. Looking at the price of food and all kinds of things, and the great fall in wheat, and the cheapness of sugar, and so forth, the labourers must be much better off?—The labourers who have employment were never so well off as now, in fact, my farm labourers, I consider, are far better off, and have many more comforts than the small farmer undoubtedly.

34,861. What should you put the improvement at in per-centages compared with 20 years ago when the prices were high?—The condition of the farm labourer?

34,862. Yes?—The per-centage of the improved condition?

34,863. Yes?—25 per cent. at least.

34,864. I suppose the lower class of labourers have benefited more than the higher ones?—They have all benefited much. The lower ones—those with large families—have benefited more.

34,865. They did not consume much meat formerly?—They did not; they do now.

34,866. They spend what they have saved in the purchase of corn and bread, and sugar, and so forth, and in meat?—In meat and clothing. Women formerly did a good deal of work in the fields; now they do none, and it is very difficult to get a woman to assist as a charwoman and that kind of thing.

Employment of women.

34,867. And the improvement has shown itself in the women withdrawing themselves from the field work?—Yes.

34,868. Do they occasionally assist in the harvest time?—The native women who live in the cottages do no work at all. I get some Irish women to do work and so on, but those who live on the farm and in the cottages do no work on the land, neither do they let themselves to the gentlemen's or farmers' houses to assist as they used to do.

Reduced labour.

34,869. Has there been any decrease in the employment of labour in the district?—Undoubtedly.

34,870. Is it owing to the conversion of arable land into grass?—Yes.

34,871. Has there been otherwise a reduction?—Yes; the improvement in machinery would account for a very considerable reduction.

34,872. Then the farmers have been able to make some economy in that direction?—Certainly.

Unemployed labourers.

34,873. Are there any agricultural labourers out of employment in your district?—They are not in my immediate district. It is difficult to say who are agricultural labourers, because, sometimes, if a man loses his employment, he goes into the town or becomes a collier, and we get men from the colliery districts in the summer time to assist, and for the time being they are agricultural labourers.

34,874. As compared with 20 years ago is there any difference?—I see a good many without employment and a good deal of begging, and so on, about the towns. I think that the labour market is altogether overdone.

Mr. R. Stratton.
3 Nov. 1894.

As a matter of fact, I may point out that I have a man now who is by trade a fitter, and is not allowed by his Union to work under 10*d.* an hour, and he has been working for me for 14*s.* per week, and he is very glad to continue; he is a perfectly able-bodied and capable man. But these Unions keep up the price of labour if they have to be idle three parts of their time, they will not reduce their price.

34,875. You are speaking of labourers in the towns?—Yes, the unions of the towns and colliery districts.

Cause of depression.

34,876. Then what, in your opinion, is the cause of the depression, such as it exists in your district?—Well, low prices of course, are the prime cause. The cause of low prices, is rather a big subject. I suppose, over-production in the first instance; and there are some other causes as well, we think. We do not think that it can be entirely over-production. There has been over-production before to-day, but never such low prices as we have to-day.

34,877. Well, then, do you think that the charges on land are too heavy?—Yes, I think so. It was all very well to tax the land to the extent it was taxed when we had a monopoly of supply of food to the people, but as soon as that monopoly is taken away it seems to me that, at all events, we ought not to be charged higher than other kinds of property. I am inclined to think that it is over charged.

Rates.

34,878. Has the assessment of land been reduced in proportion to the reduced rent?—Yes, generally.

34,879. What do the poor rates average in your district?—3*s.* in the £—something over 3*s.* in the £.

34,880. Is that the same as it used to be?—In my parish of Duffryn the rates in the £ were 3*s.* 10*d.*, 2*s.* 10*d.*, 2*s.* 4*d.*, 2*s.* 8*d.*, 2*s.* 6*d.*, 3*s.* 2*d.*, 3*s.* 8*d.*, during the last few years.

34,881. As compared with 20 years ago, what do you say?—I do not think there is much difference.

34,882. In spite of the reduction in the assessment?—The assessment per £ is much about the same.

34,883. I thought you said the assessments had been reduced?—They have been reduced.

34,884. But the aggregate assessments are about the same?—We are paying the same in the £ as before.

34,885. But your assessment has been reduced?—Yes; agricultural assessment.

34,886. How much has that been reduced for the whole union?—I should say about 10 to 15 per cent.

34,887. (*Mr. Whitehead.*) Have the assessments been reduced down to rentals?—Yes, I think so.

Deteriorated farming.

34,888. (*Chairman.*) Do you think there has been any deterioration of farming in that district?—Yes. I do not think that the farming is as good as it was 20 years ago. There is no encouragement to spend money upon land now that there was formerly.

34,889. Do you consider that the present system of tenure has had any effect upon the depreciation?—The system of tenure in vogue in our county do you mean?

Tenure.

34,890. Yes?—No. I think the system of tenure in our county is as fair as it will be found in any county.

34,891. Is land held in yearly tenancies generally?—Generally.

34,892. Under leases?—Very few.

Scale of compensation in Monmouthshire.

34,893. Is there a custom of the country better than the provisions of the Agricultural Holdings Act?—I would hardly say that. The custom of the country is not very clearly defined. With regard to compensation for unexhausted improvements, the Monmouthshire Chamber of Agriculture, after the passing of the Agricultural Holdings Act, drew up a scale of compensation which was agreed to between landlords and farmers at several meetings, and it has very generally been accepted. This is a copy of it, which I shall be happy to put in (*see* Appendix V.).

34,894. How does that compare with the Agricultural Holdings Act?—Well, the Agricultural Holdings Act simply lays down a principle, I think.

34,895. And this scale applies that principle?—This defines that principle.

34,896. (*Lord Rendel.*) Does it resemble the custom of Glamorganshire?—The custom of our county is not the same as Glamorganshire, but the custom of our country varies in almost every parish; it is difficult to say what is the custom of the county as a county. I think before the passing of the Agricultural Holdings Act there was a very inadequate compensation for unexhausted improvements. Perhaps I may say the general system was that the outgoing tenant should sell off everything, or that was so in a certain district; at all events, he should sell off almost everything and the incoming tenant had practically nothing to pay. In another district straw had to be taken at a standing price; also certain proportions of hay, and the outgoing tenant had a right of one-third of his land in wheat as an off going crop which he took free of all expense.

Mr. R. Stratton.
16 Nov. 1894.

34,897. Would the Glamorganshire custom be regarded as a good one?—It was favourable to the outgoing tenant.

34,898. (*Mr. Little.*) Were they Lady Day entries?—Generally Candlemas—the 2nd of February.

34,899. Then the out-going tenant had possession of a certain portion of arable for a crop of corn to the Michaelmas following?—Yes.

34,900. Paying rent only up to Candlemas?—Yes.

34,901. (*Chairman.*) What do you consider the remedies for the depression, as you describe it?—We look to the Commission to inform us on that subject.

34,902. What do you suggest yourself?—I really cannot see at present that there is any practical legislative proposal that can be made to remedy agricultural depression. I suppose you cannot make prices larger by legislation, or you are not prepared to do so at all events; and it is the lowness of the prices which causes the difficulties of the present time.

The Agricultural Holdings Act.

34,903. (*Mr. Channing.*) I take it from your brief that you approve of the recommendations of the Central Chamber of Agriculture as to the amendments of the Agricultural Holdings Act?—I do so generally.

Land laid down to grass.

34,904. (*Chairman.*) You think more land will be laid down in grass?—I think it is absolutely certain that there must be an enormous quantity of land laid down to grass eventually, because growing corn at this price on any land must be a ruinous business as compared with the prospect of what you can keep on grass land. The tendency will be to lay down as much land to grass as possible, to keep stock and save labour, and cut down the labour bill. Agricultural labourers in a few years' time, if things go on as now, will be very scarce indeed.

Labourers and landlords.

34,905. (*Mr. Everett.*) The land cannot maintain the labourer and the landlord—it cannot pay wages and rent too?—No, I think not.

34,906. (*Mr. Lambert.*) Which do you think will have to go to the wall?—Well, I think the going to the wall of the landlord will not put the labourer in a better position—I do not see how it will.

34,907. But Mr. Everett asked you whether the land could bear both wages and rent. You replied that you thought that they could not bear both, so I ask which of them ultimately will the land bear?—I think it is very likely it will bear very little of either with the land laid down to grass, and the landlord will very likely farm it himself.

34,908. (*Mr. Everett.*) If the land is laid down to grass it will bear rent, but not carry wages?—It may bear rent, but the landlords may have to carry on the farming themselves.

34,909. (*Viscount Cobham.*) But hitherto rents have fallen and wages have not fallen?—That is so; but there is less labour employed upon the land than formerly.

34,910. (*Chairman.*) That is partly due to improvements in machinery?—No doubt also to the large quantity of land laid down to grass.

Reduction of rent.

34,911. But, according to your evidence, the reductions of rents so far have not been considerable?—Not very considerable. In common fairness I ought to say that I am renting under an exceedingly good landlord—Lord Tredegar—and his reductions have been, and are at the present moment, 20 per cent.—10, 15, and 20 per cent. We have 20 per cent. now, but it ought to be understood what that means. Of course, a reduction of 20 per cent. from a highly raised rent of, say, the years 1872 and 1873, might not mean very much sacrifice to a landlord; but it is only fair to say that Lord Tredegar's rents have not been raised since 1860, and then a general revision took place, and, as far as I know, without a general increase. Therefore his Lordship's reduction is a much more meritorious reduction

Mr. R. Stratton.
16 Nov. 1894.

than a 50 per cent. reduction might be on a highly raised rent of 1872 and 1873.

34,912. I think you said in the best district the average reductions have not been nearly so much. They do not amount to more than 10 to 12 per cent.?—In the low grass district.

34,913. And in the case of small farms on the hill sides I think you said there had been no reduction?—I hardly say none, but it has not been so general, and in many cases no reductions have been made. I would like to put in a little pamphlet which I wrote for the Royal Agricultural Society on Economy in Cultivation.

34,914. Do you make any suggestions there?—Yes, I do. I do not know that I need trouble you with this, but if the Commission would like, I would be happy to send copies to members of the Commission, but I think there is room for very considerable economy in the cultivation of land, and I am alluding here especially to the system adopted in ploughing. The lighter lands are the lands which now are almost the only lands that can be made to pay anything at all for cultivation, and those lighter lands I think may be cultivated very much more economically then they are at present. In advocating here a light plough on a gang system, a man to ride and drive three horses abreast. I have adopted that system in Monmouthshire and Gloucestershire with many good effects, and I think there is room for a very considerable saving by doing so.

The "gang" plough.

34,915. (*Mr. Lambert.*) Would that plough the land that is not level?—I am using it on very unlevel land.

34,916. What would you term a "gang" plough?—Well a plough which a man can ride. That is what I understand by a "gang" plough. This is a plough that you can either ride on or get off and walk behind it.

34,917. How many furrows has it?—Three furrows.

34,918. And three horses?—And three horses abreast.

34,919. (*Mr. Whitehead.*) The same system is adopted in America very largely?—Yes. I do not say that it is a suitable plough for all kinds of operations, but I maintain that a great deal of the ploughing now done deeply and expensively might well be done at half the depth, and would be for all practical purposes as well, and it can be operated upon by this plough quite as well as it can with the ordinary plough.

34,920. How many acres do you say can be done by three horses?—Three acres.

34,921. One man and three horses?—Yes.

34,922. (*Mr. Clay.*) You have no stones to disturb the gang plough, have you?—I have used this plough on as stony a farm as you will find on the Cotswold Hills, and I am using two or three of them with excellent effect on stony stubble.

34,923. (*Viscount Cobham.*) Whereabouts is it on the Cotswold Hills?—Nine miles above Cheltenham.

34,924. (*Chairman.*) You think in this way there might be considerable economy?—I do.

34,925. And one pair of horses out of every four might be dispensed with?—It is quite possible.

34,926. And inasmuch as a pair of horses and a man's wages, and interest on money, and depreciation of horse and harness varies from 75*l.* to 100*l.*, you think that that would result in a very considerable economy?—Yes.

34,927. Then you think also that a large amount of land would be laid down in grass?—Yes.

34,928. And then you might go in for butter-making, dairying, or cheese-making?—And stock raising and sheep farming.

Cheese-making.

34,929. Is there much opening for cheese making in your county?—I think there is a very large opening for cheese making. I do not see why the cheese produced in this country should not vastly be increased.

Dairy factories.

34,930. Would you advocate the extension of factories for the purpose of co-operative cheese-making?—I am not prepared to advocate that. I see no particular necessity for that. I think cheese-making can be done very well in the farmhouses, provided they have suitable farmhouses and dairies.

34,931. Is there much butter made in the district?—Not as much as there should be.

34,932. Do not you think that it would be possible to improve it, and maintain the average quality of butter in the district?—Undoubtedly.

34,933. Would not that be better done by factories?—Well, I am afraid it would be making an average low quality from factories, because they have a way in factories of mixing other deleterious articles with butter. I was told the other day by a great authority on butter-making that 20 samples of butter were taken from first-class hotels in London; and in 18 out of the 20 there was adulteration by animal fat. I am told that this is a very prevalent system in butter factories.

Mr. R. Stratton.
16 Nov. 1894.

34,934. (*Mr. Lambert.*) The imports of margarine have gone down, and the imports of butter have gone up very considerably?—Yes.

Technical instruction

34,935. (*Viscount Cobham.*) Are the county council doing anything to improve the manufacture of butter?—Yes; we have a dairy school, and I think that it is working very well. We have a competent teacher—it is an itinerant school, and there are plenty of applicants for learning. This has been going on for three years, and next year we propose to teach cheese-making. Especially Caerphilly cheese-making under an improved system.

34,936-7. Are these classes well attended?—The dairy schools for butter-making are fairly well attended.

34,938. By the right sort of people?—Yes; farmers' daughters and wives.

Laying land down to grass.

34,939. Do you notice any improvement in the butter produced?—They say there is considerable improvement.

34,940. I suppose there is a good deal of land in Monmouthshire that is well adapted for laying away to grass?—I think so.

34,941. It is an expensive process for a number of years. How soon in your opinion should it become remunerative to a tenant farmer?—I am bound to say that I have not found it an expensive process. I mix Dutch, Alsyke, cow-grass, perennial rye-grass, timothy, and cocksfoot. That is all I put in; about 3 lbs. of each of the clovers, and perhaps 10 lbs. of each of the others.

System of cultivation.

34,942. (*Lord Rendel.*) You feed rather heavily?—Yes, and manure too. I think farmyard manure is better expended upon young seeds than anything else.

34,943. (*Viscount Cobham.*) You put in a corn crop?—I sow it in a corn crop, and I put a dressing of farmyard manure on and graze it.

34,944. How soon do you put sheep on it?—After taking the crop of hay off, do you mean?

34,945. Yes?—Any time.

34,946. (*Mr. Lambert.*) When farmyard manure is used is it after the young seeds in the spring?—Whenever I have it to spare.

34,947. You would not take it out in frosty or wet weather?—I would take it out in wet weather, but not in frosty weather.

34,948. Do you use the manure with the straw quite long?—Sometimes. I prefer short manure for young seeds, because if you have long stuff it is apt to cake down and kill the plants.

34,949. Which do you think is the best time for dressing young seeds with farmyard manure?—I am hardly prepared to say when. I like farmyard manure on seeds at any time, but I never do it except at leisure time—I never stop farming operations in order to haul out manure.

34,950. Do you let the manure rot for a whole winter?—I take it out as soon as it is made sometimes.

34,951. Then it would be long straw; it would not be rotten?—Sometimes we have manure made from short stuff, and odd manure of that sort; and I take on to the grass land road scrapings and any odd stuff.

34,952. On the question of weeds, do you calculate weeds in the manure would have a detrimental effect for putting upon seeds?—No.

34,953. Say charlock?—If they had the mowing machine it would settle that.

34,954. Would it grow?—Yes, but if the land was ploughed deep down it would not.

Technical instruction

34,955. (*Mr. Whitehead.*) Does your county council do much in the way of practical agricultural teaching?—We have this dairy teaching, and we have a teacher to instruct in horticulture, fruit growing, and all matters pertaining to gardening. We have had a very competent man recently, and we have

Mr. R. Stratton. 16 Nov. 1894.

done very good work. He also teaches at two industrial schools where they have a garden in connexion with those schools, and the children are taking readily to the teaching and appreciating it; and I think he is doing very good work there.

34,956. Has there been an improvement in dairying and cheese making from the education given?—Our teaching of cheese making has not yet commenced; and in butter making it is generally admitted that there is an improvement.

Butter-making.

34,957. Have you a good sale for butter in your district?—Yes, we have a fairly good sale, but I am bound to say that there has been, and is generally a want of uniformity, and an absence of good quality, which has rendered the butter less saleable than it should be.

34,958. In your opinion could butter making be extended in this country?—Yes, very largely.

34,959. And would it be a source of profit to agriculturists generally?—I think a living could be made out of dairying at these prices.

Poultry-keeping.

34,960. Would that apply to poultry-keeping also?—Poultry-keeping in a moderate way. I am bound to say not in large flocks of fowls or anything of that kind, but with small farmers and labourers I think assistance af that kind works very well. There is a good deal of it done in our county.

Fruit and vegetable culture.

34,961. You spoke of fruit culture just now; could that and vegetable growing be extended to the advantage of agriculturists?—Yes; in a country such as ours where we are close to large towns, and where railway carriage can be dispensed with, I may say where they can get a distribution of those things straight to the consumer, which they do now to a very large extent in the neighbourhood of our towns, it could be profitably extended.

Flax growing.

34,962. I notice in your proof that you have advocated the culture of flax?—Yes.

34,963. Do you think that is likely to be a profitable culture in this country?—I cannot see why flax cannot be profitably grown in this country to a far greater extent; in fact it is not grown at all now. I grew flax for some years, as much as 80 acres in a year. Then I had an excellent market for the straw at 4*l.* 10*s.* per ton for paper making. But, like everything else, they found something cheaper, and I lost my market, and I had to give up flax growing.

34,964. That is the great difficulty—the getting rid of the straw?—Yes, it is. But as you know there are thousands of tons of flax imported into this country; it is brought from the centre of India, the centre of America, and continental countries, and it can just as well be grown in this country.

34,965. (*Mr. Little.*) Is not the difficulty of labour one of the deterrent causes, to get children to do weeding and pulling?—That would be necessary, no doubt, if you are going in for very fine flax for linen purposes, but in the neighbourhood of large towns there is plenty of labour available now; and, I think, in the northern parts of England, near the manufacturing towns of Bradford, and so on, where flax is used, and where the carriage might be dispensed with, or saved to a considerable extent, it might be grown. There is a very large amount of linseed imported, and there is no doubt that we can grow flax just as well as other countries can, and I have grown excellent flax, 20 bushels of seed per acre, and two tons of straw.

34,966. (*Mr. Whitehead.*) It is not the difficulty of climate or soil but it is the disposition of the fibre?—For fine linen?

34,967. Yes?—But then flax fibre is now used for so many things. I cannot help thinking that there must be a market for a moderate fibre as distinguished from the very fine fibre for fine linen.

34,968. You also advocate beet culture, that is sugar-beet, I suppose?—I merely threw it out. Why sugar-beet should not be grown in this country, and sugar manufactured, I do not know, except that the foreign bounty system, I suppose, would kill it.

Course of prices.

34,969. (*Mr. Giffen.*) You told us, I think, that you had done rather better than some of your neighbours because you saw what was coming, and you anticipated them in laying down land to grass?—Well, I said, I think that I had done better than I should have done—not better than my neighbours that I am aware of—but better than I should have done myself if I had not laid it down to grass.

34,970. At what time did you begin to see what was coming?—As soon as I saw the prices of corn dropping, I cannot tell you offhand, any time, but something like 20 years ago.

Mr. R. Stratton. 16 Nov. 1894.

34,971. As long ago as that?—Yes.

34,972. You began to think there was something in the price of corn that you could not depend upon, and you began to lay down to grass?—Yes.

34,973. Can you give any idea what is coming now similar to what you thought then?—It looks like very general ruin, that is what it seems to me now.

34,974. You have no similar calculation as to the future, similar to what you had 20 years ago?—It is no good prophesying unless you know.

34,975. In this case you seemed to know?—I happened to guess right, but it is impossible to forecast at present.

Foreign competition.

34,976. And you have no idea as to what the nature of the foreign competition is, and the nature of foreign agriculture that would throw a light upon the probabilities of prices?—Well, so far as I can understand the position with regard to foreign corn growing, we are now being driven out of the corn market by a class of labourer in India who is content to live upon a handful of rice per day with a rag round his middle. And as to the Argentine Republic, I met with a man who has had more experience of that district and of corn growing in that district, a man named Goodwin, [who has managed to get up and work a great trade in grain by the system of grading the corn which is now brought to great perfection; and a large corn growing business is now carried on from that country] and he told me that it would increase to a very large extent. The Italian labourer in that country is quite content to work from sunrise to sunset for something about 1*s.* to 1*s.* 6*d.* per day, and so long as he has enough to eat, and just a trifle of clothing that is all he cares for, simply to eat and live in a very low way such as our labourers in this country would scorn to adopt. We have nothing to expect but a continuation of that sort of thing, because Mr. Goodwin tells me that they will go on growing corn at present prices.

Foreign competition and labour wages.

34,977. Then the condition of things is that whereas the agricultural labourer in this country has improved his position very much in the last 20 years, there is a vast mass of labour elsewhere which has not improved its position, and which is still at any rate in a very inferior condition, and that we have to compete with that labour?—Yes.

34,978. That is what it comes to very much, the agricultural depression at the present time?—Yes, and the effect of it will be (and it has now already driven a great many of our agricultural labourers off the land) that it will drive a good many more off the land. The present rate of wages is kept up because the rate of wages in the towns is kept up owing to the trades unions, owing to their protective system, it is kept up. As soon as that comes down, or in case that system should be broken through what the circumstances will be I do not know, and I may say there will be millions of men thrown out of employment and no agriculture to go to, and in case of war or anything of that sort the situation would be to my mind absolutely ruinous. It looks like national ruin.

34,979. Would not the position be much the same if prices had not fallen, but the agricultural wages had gone on in kind instead of money, would not that have come to very much the same thing?—If the price of agricultural wages have gone up that would be the result of more land brought into cultivation or land being kept in cultivation and a larger demand for labour.

34,980. Possibly not. If all wages have gone up, if money wages have gone up generally and agricultural wages were expressed in money, would not it have had much the same effect as what has really happened when money wages have remained pretty much the same, but the prices of produce have fallen?—I do not quite understand your question.

34,981. Supposing you were to give the labourers now 30*s.* per week instead of 20*s.*, would not that put you into much the same position as when produce has fallen in price, but the wages have not gone up?—You mean the farmer?

34,982. Yes?—Possibly. I am not complaining of the farmers' position at the present moment. I thought you were talking of the labourers' condition.

Mr. R. Stratton. 16 Nov. 1894.

34,983. I am talking of competition with foreign countries—I am talking of the competition with the Argentine labourer, and I will put it to you that you might have had the same competition without any fall in prices provided that the wages of labour here in money had gone up along with other wages?—That is to say the farmers' competition; the farmer of foreign countries——

34,984. Would have been much the same if that had happened?—Well, I am not prepared to say how that would work out, but there is a general feeling that high prices are in favour of the farmers rather than low prices.

34,985. But have you thought that out very carefully yourself? Would it not be the case if prices were to go up for farm produce, and all other prices and wages were to go up alike, you would not be any better off than you are now?—I should like to try that before passing an opinion.

34,986. You have not worked that out?—Not in that way.

34,987. Because it is quite easy to see if the prices of agricultural produce were to go up, and nothing else was to be changed you would be much better off; but if your prices were to go up, and all wages were to go up at the same time and in the same degree, what better off would you be?—As a matter of fact all I can say is that when prices were higher I was much better off than at present.

34,988. That is because your prices were higher and other things were in a different relation to them from what they are now?—You are speaking of feeding stuffs and manures.

34,989. Generally?—Well, farming at one time was in fact always looked upon as a 10 per cent. business, which I think many years ago was the case, but it is more like a 2½ per cent., that is how it works out at the present moment, or 10 per cent. the wrong way in a year like 1893.

34,990. It has shared the falling off of profits that has been going on in many other businesses?—In some other businesses.

34,991. Then you have made no calculations as to what the probabilities of the competition are likely to be in future, as to what the general effect of all the threatening is likely to be?—It all depends upon whether any disturbing element may turn up. The very rumour of war would alter the situation of everything; but so long as we remain at peace probably lower prices will prevail.

34,992. That is an answer to my question, that is what I wish to get at?—Quite so.

State loans.

34,993. (*Mr. Clay.*) I see one of your remedies has reference to State loans; what is your opinion upon that?—Well, I do not know that anybody wants them in our part of the world, and whether land in any part of England is sufficiently valuable property to invest borrowed money upon it to a large extent is a great question to my mind.

34,994. But for building or draining the loan companies were very excessive, their interest being about 6½ per cent., was not it?—Yes.

34,995. If Government would lend money at something like 3 to 3½ per cent., would not that benefit the landlord and perhaps the tenant?—I think it is extremely doubtful whether any land that requires draining would pay for an expenditure of borrowed money even at the per-centage that you are speaking of now. I am speaking of the general system, and I do not think that landowners have any particular desire, certainly not if they are wise, to go in for encumbering their estates by borrowed money for improvements with the present prospect of things. If prices were high of course there would be every inducement to spend money on their land and increase their produce in every shape and form.

34,996. But from the landlord's point of view what is the land worth undrained, and what is to become of the buildings if they are left unrepaired? What is to be the ultimate effect upon the agricultural tenant if these things are left without money being spent on them?—What is the value of the land as it stands at the present moment? I suppose you would be alluding to some of the strong lands of Essex and the heavy clay, for that must be drained in order to be made suitable for cultivation. Probably such land would be only worth, to sell, 6*l.* to 7*l.* an acre, and a man would be a bold man to spend money like 10*l.* in permanent improvements upon such land as that. I question whether it would not be better, as an economical process, to lay the land down to grass, and cut down all expenses, and let him get what he can for it at present.

Mr. R. Stratton. 16 Nov. 1894.

34,997. You do not think it would benefit agriculture in all classes of land to have cheap money for repairing buildings and draining wet land?—I think it would be well that money should be available if wanted, but I do not think that it would be availed of to any large extent at the present time. There is no spirit left in the landowner to invest anything in his land.

Malt tax.

34,998. Regarding another question as to the growing of barley. Have you ever considered what effect the taking away of the Malt Tax, and putting it on the beer has had upon the value of barley?—I do not think that it has increased it.

34,999. Has it diminished it much?—I am afraid it has.

35,000. To what extent?—It is very difficult to say to what extent, but I am afraid it has been a very bad measure for farmers, all kinds of barley now come into competition, and we have no longer the monopoly of supplying, I may say, the chief ingredient of the brewer, that we had formerly—foreign barley is coming into that. I do know something about that, because I happen to be chairman of a big malt company, and we are using more foreign than English barley.

35,001. But with regard to the abolition of the Malt Tax what benefit do the general public get from it?—They get drunk cheaper.

35,002. Do they get their beer any cheaper?—Yes, I should think so.

35,003. And as a farmer would you like to see the Malt Tax renewed again?—I think farmers would, but they do not expect it.

Laying land down to grass.

35,004. You have been questioned very closely upon laying down to grass. Do you consider that it is of very vast importance, considering that corn farming does not pay?—Yes, I do.

35,005. And you take the view that you cannot get grass land into condition without feeding it?—Yes.

35,006. And you consider the most important thing for feeding it is through the original farm yard manure?—I prefer that.

35,007. You consider that the basis of laying down to grass?—I will not say that.

35,008. It is one of the principal bases of getting grass land into condition?—But I will not say farmyard manure is the only thing. There are plenty of manures as well as farmyard manure.

35,009. Do you consider that feeding of sheep on cake and corn liberally, both winter and summer, is of great benefit?—Very great. I think that is one of the principal lines of the future to endeavour to improve our grass lands by the feeding with artificial feeding stuffs, and cake, corn, and so on. I have done it on this grass land to an incredible extent, and it is a profitable operation.

35,010. You consider that more land should be laid down to grass, and the remaining arable land be more highly cultivated?—Yes.

The Agricultural Holdings Act.

35,011. As regards the Agricultural Holdings Act you say it has not been taken great advantage of in your district?—I would hardly say that. I am farming under the Agricultural Holdings Act. My landlord, Lord Tredegar, adopted it in its entirety as soon as it was passed. I am also farming under the Agricultural Holdings Act at Portskewett under Mr. Lewis, and if it has not been adopted in its entirety, the general principles of the Act have been adopted to a very considerable extent.

35,012. But you have never gone out of a farm and had the advantage of the Agricultural Holdings Act?—No.

35,013. Regarding this disputed question about getting articles for going in and working that Act, has it not been that the procedure has proved very expensive, and the arbitration itself has also been expensive?—I believe so.

35,014. What do you propose; do you propose an official referee in each county?—I am hardly prepared to recommend that.

Mr. R. Stratton.

16 Nov. 1894.

Official referees.

35,015. What would you recommend?—Who is going to appoint the official referee?

35,016. I am going to ask you that question?—That would be a rather difficult point, I think we should be getting involved in political questions or something of the sort. I do not see why these questions should not be determined as they crop up by local valuers who should undoubtedly be thoroughly qualified men, but I do not think there need be any official appointment in regard to determining all questions with regard to the Agricultural Holdings Act.

35,017. Who deals with this question in local Chamber of Agriculture?—The local valuers; they are sometimes farmers and sometimes land agents, and sometimes auctioneers who determine this question.

35,018. Would not it be as well to have, set aside, two or three men, who would naturally become experts in working out this business, like the Drainage Commissioners?—Well, it all depends upon how they were appointed, and the class of men they were; I think the less officialdom we introduce into our system the better.

35,019. Would it not be better to have one referee to decide between the parties rather than to go to the expense of two referees?—Yes, but the usual practice in leaving a farm is, for the outgoing tenant to appoint one arbitrator, and the incoming tenant to appoint another, and they appoint a third party, and that in general works satisfactorily.

35,020. (*Chairman.*) The result is that three men are employed on this arbitration?—The third is not generally employed. The third is appointed as a referee, but it is only in case of a dispute that he is called in.

35,021. (*Mr. Clay.*) But in this business I want to save expense. Do not you think that a sound substantial referee, a strong man, would be sufficient to arbitrate between the two parties?—He might be sufficient, but there is always a feeling among farmers that unless they have a special man appointed by themselves to look after their interests that their interests are not looked after at all; and I do not think that they would be satisfied with an official referee appointed by anybody.

35,022. Would not that increase the expense?—It would increase the expense somewhat.

35,023. With regard to this schedule that has been handed in dated 2nd February 1884, have any alterations been made upon it?—No alterations have been made, but it is the opinion of some that certain alterations should be made. I drew that up myself, and I do not know what alterations they suggest. It seems to me tolerably fair, and it has been generally adopted in cases of dispute.

35,024. But considering that the Agricultural Holdings Act has been passed since then, you think there might still be improvements?—Possibly there might, but I am not prepared to particularise.

35,025. But still it is open to improvement, you think?—Yes.

Rent.

35,026. (*Mr. Little.*) You gave us the rent of some of the districts that you described, but I do not think we have got any particulars as to the rent of the first district lying next to the sea?—Well, that varies from 30*s.* an acre to 3*l.* 10*s.* per acre.

35,027. According to the proportion of grass and the nature of the grass?—According to the nature of the grass, the elevation above the sea, generally speaking, and also the treatment that it has received. There is a large tract of land which has been mown year after year and no manure put upon it, and that land has somewhat deteriorated in value. There is other land which has been done better, the value of which has been more fully maintained.

35,028. Is that land subject to any heavy charges for sewers rates or sea wall?—Yes, some of it is liable to certain charges, but they do not amount to very much, perhaps a couple of shillings per acre.

Laying land down to grass.

35,029. You were asked if your land did not take kindly to grass. Is not there something in the climate that you have, much more moisture in it than the east of England, and that makes it more easy to grow grass?—No doubt.

35,030. You do not suffer from spring droughts to the same extent as we do in the east of England?—Our rainfall throughout the year is greater than yours by 12 inches; but we get droughts occasionally—we thought so last year at all events. I think we suffered last year as much as any district in the country.

Mr. R. Stratton.

16 Nov. 1894.

Scale of compensation.

35,031. You told us that the Monmouthshire Chamber of Agriculture had settled a scheme for compensation; that was a fixed scale based upon expenditure?—Based upon the expenditure of different articles.

35,032. That was thought to be a practical working out of the Act of 1883, which contemplated compensation not on the basis of expenditure, but on the basis of the value to the incoming tenant?—Yes.

35,033. Regardless of expenditure?—I think so, regardless of expenditure.

35,034. But this was thought to be the practical way of ascertaining what was left for the incoming tenant?—Yes.

35,035. And it was really reverting to the principle of the Duke of Richmond's Act, which was compensation based upon expenditure?—I do not remember what that was exactly. Our point is this: that the tenant should be allowed to sell anything, provided that he returns the manurial value.

35,036. But in the case of the man who sells nothing and uses artificial food, the question of returns would not come in?—No, it would not. But then he would be compensated for the manurial value of the stuff consumed.

35,037. Did you contemplate that manurial value being ascertained by deducting a proportionate part of the cost, or by some theoretic calculation as to the residue?—Well, neither one or the other exactly. I think I handed in that scale of compensation.

35,038. I have it here, "Compensation for feeding "stuffs," the manurial value of certain articles consumed?—We classify the different stuffs, those being highly nitrogenous we place in one category.

35,039. The point I want down on the notes is that you gave, or recommended for general adoption, compensation on the basis of the expenditure?—Yes; yet not entirely on the basis of expenditure, because we put one class of feeding stuff on a higher scale than others.

35,040. But you begin your calculation by taking the bill and saying, here so much has been spent, and we give one-third or one-sixth, or whatever the case may be in respect of that expenditure?—Yes.

35,041. You said you approved of the recommendations of the Central Chamber of Agricu ture; did you refer to the recommendations of the Committee of the Council?—I meant to say the Committee.

35,042. Did you include the resolution of the Council that was arrived at at its last meeting?—I forget what that was.

Compensation for disturbance.

35,043. In favour of compensation for capricious disturbance?—No, I do not say that.

35,044. When you said you approved of the Central Chamber's recommendations, you did not include that latest decision of theirs?—No, I did not.

Official referees.

35,045. Mr. Clay put some questions to you about the expense of arbitration, and he asked if the expense would not be lessened by having a single arbitrator. But do you not think that if a single arbitrator was appointed the farmer would want some expert or professional man to state the case before the referee?—I am sure he would.

35,046. In 99 cases out of 100?—Yes.

35,047. And probably this expert would charge the same as the valuer who is now employed by the farmer?—Precisely; he would be the same man.

35,048. Where does the saving come in?—I do not quite see.

35,049. In that case there would be always the official referee to pay in addition to the two experts?—Yes.

35,050. Whereas now the two experts frequently settle the case without any reference whatever to the official referee?—Yes.

Prices and wages.

35,051. Then with regard to one question which Dr. Giffen asked you, "if prices rose and wages rose," would you be any better off. Is it your experience that wages do adjust themselves to the rise and fall of produce?—Not at all; not in the least. Formerly it was thought that bread was the standard that regulated wages; it has nothing to do with wages.

Mr. R. Stratton.
16 Nov. 1894.

35,052. (*Mr. Dalton.*) I do not think that we have had the rent which you pay for your own farm?—I pay for 1,500 acres, including tithe, 22*s.* 6*d.* per acre.

35,053. And what is the tithe?—The tithe varies from 3*s.* to 3*s.* 6*d.* per acre.

Sale and purchase of corn.

35,054. You buy as much corn as you sell, I think?—Yes, about so.

35,055. Then in what way has the fall in the price of corn affected your profits?—In what way has it affected it?

35,056. You gain as much as you lose by it?—I do not quite see that. I should not have used so much, probably, if prices had been higher I should have grown very much more corn in all probability and sold more, and I should have consumed less corn and bought perhaps more artificial manures.

35,057. You would have bought less corn and grown more?—Yes.

35,058. (*Mr. Lambert.*) You come from Monmouthshire?—Yes.

The Welsh Land Commission.

35,059. Have the Welsh Land Commission taken any evidence upon agricultural subjects in Monmouthshire?—On agricultural subjects?

35,060. Yes?—They have held sittings in Monmouthshire, and I have been before them.

35,061. And what was the nature of the evidence you gave?—Well, my opinions were given in respect of questions such as proposed land courts and that kind of thing, the burdens of land and so on, but there was very little to be said about farming or remedies for agricultural depression or anything of the kind.

The "gang" plough.

35,062. Now I want to know about your three-horse plough. Would it cover farmyard manure when it is placed on the ground?—Not a large amount of long stuff—anything like short manure would not interfere with it at all.

35,063. Do you think that you could plough heavy land, fairly stiff clay land, with three horses?—It depends how deep you want to go. I think you would not plough stiff land deeply, but anything like heavy land ought not to be cultivated at all.

Ensilage.

35,064. You say here that roots will give way to hay and ensilage, have you tried ensilage?—Yes.

35,065. Do you largely practice it now?—It depends upon the seasons. I do not as largely practice it as I ought to do, but I do a good deal in the way of selling hay, and I think that it is perhaps the best part of my business, in fact, if it had not been for the selling of hay I should have been a heavy loser. Last year I sold 200 tons for 1,400*l.*; that saved me from heavy loss.

35,066. How do you make your silage, is it done in stack?—In stack.

35,067. Is it adequate to replace roots in the winter?—Yes.

35,068. Do you prefer a stack to a silo?—Yes, the stack process is far the best and most economical; you take the carts over the slope and tip them and treat it as a big muck heap.

Co-operation.

35,069. You think that something can be done in the way of co-operation by means of farming in the country and having a place to sell in centres of population?—I think it would be possible to have co-operation in this way; a limited liability company, if you like, occupying an estate of 5,000 acres and having stores in a town for the sale of your produce and selling it as English produce and nothing else. I think there is a very strong feeling throughout the country that English produce ought to be patronised more than it is, and people would like to know that they are securing English produce; and it would give a considerable advantage in the market if they declared it was English produce.

35,070. Do you think there would be any advantage in a number of farmers sending their produce to such a store as you suggest?—No, I do not; I think the difficulties of working would be insuperable. One farmer would wonder why he did not get the same price for mutton or other produce got by another farmer, and he would not be satisfied with the explanations given him, in fact the difficulty of working the whole thing would be insuperable.

35,071. Would it be possible for a man to take a large farm himself, who had the capital and to produce the commodity, and then sell it all under one concern in the town?—Yes, I think it would be the most economical and proper thing to do at the present time; I think that the present prices, the present times all tends towards big occupations, because clearly big occupations can be more economically worked than small ones. Small occupations might be possible and no doubt advantageous, but they can only be carried out to any extent when prices are tolerably high, because the system of producing under such conditions must be uneconomic.

Mr. R. Stratton.
16 Nov. 1894.

The Welsh Land Commission.

35,072. (*Captain Owen Thomas.*) You gave evidence before the Welsh Land Commission?—Yes.

34073. Did they hold many sittings in Monmouthshire?—Yes, several.

34,074. Were you selected by the tenant farmers to give evidence on their behalf?—No, I was not. I was invited by one or two members of the Commission to come forward. I was deputed by the Chamber of Agriculture to watch the proceedings, and, if I thought it necessary, might tender my evidence.

35,075. What was the general scope of the inquiry in Monmouthshire made by the Welsh Land Commission?—Well, I can hardly tell you what was the scope of their inquiry.

Freeholders.

35,076. Are there many freeholders occupying land in Monmouthshire?—Not a very large number—there would be some.

35,077. Would there be any mortgaged freeholders?—I have no doubt that some of them are mortgaged freeholders. A considerable amount of land is in the hands of small owners and it is mortgaged to some extent, no doubt.

35,078. What interest do you pay for mortgages?—I can hardly answer that—I should think about 4 per cent.

35,079. Do you think it would help those men if money was advanced at a lower rate of interest by Government?—With a view of encouraging freeholders?

35,080. Yes?—Small freeholders?

35,081. Small freeholders?—I do not see the advantage of especially encouraging small freeholders. I do not think the farmer is any better off in occupying his own land, or as well off as in renting land; as a matter of fact land is rented undoubtedly cheaper off a large owner than off a small owner; and if a farmer is what you may call a farmer proper and goes in for farming as a business, and he was to lock up something like four-fifths of his property in purchasing land, I do not quite see how he can be in a better position than he would be if he invested the whole of his money as an occupier.

35,082. Are farmers satisfied with the present system of land tenure in Monmouthshire?—I think so quite.

Land courts.

35,083. Are there any advocates of land courts in Monmouthshire?—I should think not. That question was brought before the Monmouth Chamber of Agriculture and was unanimously answered in the negative. Of course, when you get further away, nearer Ireland, there are a certain number of farmers who think that land courts would be desirable.

Rent.

35,084. How are rents generally fixed?—Between landlord and tenant or between the tenant and the agent, in the same way as other values are fixed between buyer and seller.

35,085. Would you say that rents are too high at present?—Yes, I should as a tenant farmer, certainly.

35,086. Have they applied for reduction?—Some have. Most have probably.

35,087. Do you think that they are paying too much?—Yes, it is difficult to understand how land can be worth anything at all if you are to judge of the value of land by the value of the produce of the land. If it is worth anything at all now it must have been worth very much more in the years gone by, and tenants certainly have not made much out of land in the years gone by, and it ought to be worth now nothing at all.

The "gang" plough.

35,088. (*Mr. Everett.*) With regard to these gang ploughs, you contemplate fleet ploughing with them from what you said?—Yes, I contemplate their working much faster than with the old system.

35,089. You mean fleet ploughing as opposed to deep ploughing?—Yes.

35,090. We have had it in evidence that if we had deeper cultivation we could double or treble the produce of the land. You, as a practical man, do not believe in that?—I think that it is perfect nonsense.

Mr. R. Stratton.
16 Nov. 1894.

35,091. (*Chairman.*) You go in for exactly the opposite?—Yes.

Large farms.

35,092. (*Mr. Everett.*) You consider that the large farms can produce most economically?—They ought to be able to.

35,093. The small farmers work hard and live hard?—Yes.

35,094. But he is not the most economical producer?—Certainly not.

35,095. Were you a farmer in 1853?—No, in 1865 I began on my own account.

Farming from 1865–78.

35,096. Do you remember the times from 1865 to 1878?—Yes.

35,097. Farming was in excellent condition then, was it not?—Yes.

35,098. So far as your knowledge goes, were the other industries of the country also in a flourishing condition?—I should say they were.

35,099. And employment quite as abundant as it has been lately?—Yes, more so.

35,100. And by consequence of the activity of industry and the plentifulness of employment would you say that progress was then proceeding more rapidly than it has been in the last twenty years?—I think so certainly.

35,101. And speaking of agriculture there was more produce out of the earth to divide between the different classes who shared it?—Infinitely more.

Low prices.

35,102. And your view is that the low prices are the main cause of the present depression in agriculture?—Yes.

35,103. And that if the low prices continue, and especially if they continue falling that something very near general ruin will be the lot of the landed classes?—That is my opinion, and not only the lot of the landed classes, but of the country altogether. It seems to me—I am not a political economist—but I should think the first principle of political economy would have been to get as much produce as possible out of your land, and to do with as little of foreign produce for your own consumption as it were possible to do; instead of which we seem to be going on the principle that it does not matter if this country becomes a barren howling wilderness, so long as bread can be had for a mere trifle, and meat in the same ratio.

35,104. (*Mr. Giffen.*) Does that apply to more produce?—More especially to the food of the people.

35,105. You would not grow cotton in this country?—I do not think so; flax can be grown.

Corn-growing.

35,106. (*Mr. Everett.*) With regard to corn is not it a fact that the soil and climate of England are eminently suitable for growing corn? Can we not beat almost any other country in the world on equal conditions?—I should say so, judging by the returns per acre of England as compared with other countries of the world.

35,107. It is not from any deficiency of soil, or climate, or skill as agriculturists if we are driven out of the field?—Certainly not.

The currency.

35,108. You referred to the competition with India; have you any knowledge of the great advantage that the Indian farmer possesses by reason of the difference in the money of the two countries?—I have a general idea.

35,109. (*Chairman.*) Have you gone into the currency question?—I have no opinion to give about it except that generally I have formed the opinion that currency must have a good deal to do with the prices; and in reading the history of agriculture in the times after the Great War, Sir John Sinclair points most distinctly to the withdrawal of the paper currency as being the cause of low prices there, and I cannot believe that it can be only a question of supply and demand, because this country must have had an excessive supply long before to-day, when prices were quite satisfactory.

35,110. Do you wish to give evidence generally on the currency question?—No, I do not.

35,111. (*Mr. Everett.*) Have you paid some attention to the depression in agriculture after 1819?—Yes. Might I say that there is a general growing opinion among farmers that the currency question has a great deal to do with the prices of commodities. More than that I do not wish to say.

35,112. Does your reading enable you to say that the same opinion prevailed in the great depression of agriculture early in the century?—Yes.

Mr. R. Stratton.
16 Nov. 1894.

Malt tax.

35,113. You were questioned about the malt tax, and the injury that some gentleman supposed had been done to the farmer by the repeal of the malt tax. Is there any part of the produce which has fallen less since 1880 than good barley?—No.

35,114. On the whole is not that the most remunerative thing that the farmer grows?—It has been up to now.

35,115. Everything else has fallen heavily on the farms?—Yes.

35,116. And that has retained its old price nearer than the others?—That is so between the best malting barley and the lower grades of barley. But I take it that there is a much smaller proportion of English barley which is now used as malt than there was formerly.

35,117. We have had, on the whole, bad seasons in England now for several years, unfavourable to the production of the very best barley?—That is so.

35,118. Have you considered the benefit that the repeal of the malt tax conferred upon the labourer who brews his own beer; he can now, if he lives in a house, under 8*l.*, be absolutely free from all taxation whatever as regards his beer?—Yes.

35,119. And the re-imposition of the malt tax would put a burden again upon the beverage, which is a favourite beverage?—Cottage brewing is not prevalent at all in our county. In Gloucestershire it is adopted to some extent, but it really does not apply to the county of Monmouthshire.

35,120. Yours is a cider county?—Yes.

35,121. And that bears no taxation?—No.

35,122. And where the cottagers brew beer they get it free, owing to the repeal of the malt tax?—Yes.

Markets in Monmouthshire.

35,123. (*Lord Rendel.*) Your modified success as a farmer you attribute largely to your immediate proximity to the great Glamorganshire mining population?—And Monmouthshire mining population; in fact, I am four miles from the town of Newport, which takes nearly all my milk; and there is a very large mining population throughout Monmouthshire and Glamorganshire who are good customers for all kinds of produce; and hay sells very readily there.

35,124. In dealing with this population you deal more directly than is commonly the case?—I do not say that that is the case more commonly than in other districts; but what I wished to convey was, that a large number of small occupiers within a considerable radius of these large populations in big towns, take their stuff right into the towns, and deliver it about the houses, the market gardeners and small farmers with their dairy produce, and their poultry, and so on, and undoubtedly they have got an advantage by doing so.

35,125. The middleman is not so general?—That is so.

Small holders.

35,126. I think you spoke of the small holders upon the hill land as being very hard working men generally?—We are all hard working men, all the farmers in Monmouthshire and Glamorganshire. I do not know that he is any harder working than the rest of them; he is a hard working man, as a rule.

35,127. You spoke of him as a hard living man, and his being thrifty and prudent?—Yes.

35,128. You spoke of the rents in that district as being well maintained?—I should say that they have been better maintained than in any other part of the county, simply because this hill man is, to a great extent, a stock farmer, and especially a sheep farmer, and the prices of sheep have been fairly well maintained all through.

35,129. Then it is rather the condition of farming, in his case, than the fact that he has specially hard living, and equally hard working, that has led to the maintenance of rent?—Yes.

35,130. You do not suggest that any advantage has been taken of him as a small man?—No.

35,131. His circumstances are more favourable?—Just so.

Mr. R. Stratton. 16 Nov. 1894.

35,132. And you would contrast his position with that of the labourer to the latter's advantage?—I would; I consider my labourers with 15*s.* a week, and a cottage free, with other perquisites live more comfortably and work distinctly less hard than those small farmers.

Labourers.

35,133. With regard to labourers is it your custom to look to the question of cheapness or dearness of labour; to the quality rather than to the wage?—Of course we expect them all to be up to a certain standard of excellence, though as a matter of fact you cannot get them all equally good. I am bound to say that the labourers I have on my farm are as a rule good labourers, and thoroughly good respectable men; but I am in an exceptionally favourable position as regards cottages. I have a large number of cottages, consequently I am in a position to select my labourers, and in fact I am in a stronger position with regard to labourers than most other farmers.

35,134. Does the neighbourhood of a large labouring population assist you in selecting men?—Perhaps it would do. I have no difficulty with regard to the labour question, and if I am short of a man it is only to put an advertisement in the paper, and plenty of applications are sent in, and they are generally from the colliery districts. My farm labourers who have had experience of colliery work as well as farm work, are well content with their position with me, rather than with the collieries, where they can earn double or treble the wages. The drawbacks of a collier's life, and of one who works in the ironworks, and steel works, are very great as compared with that of the farm labourer.

35,135. So far as that goes, it is a set off against the disadvantage you are under of the wages being determined for agriculture by the prevailing wage of the district for mining?—To a certain extent, yes.

35,136. And would you say that you have been able to notice any distinct rise in the quality and character of the intelligence and work of the labourer?—I cannot say that he does more work, or is a better workman than formerly but I cannot complain of any deterioration as far as my own regular men are concerned. I see an absence of young agricultural hands coming on very generally around, but I feel no difficulty or inconvenience in any way from scarcity of labour.

35,137. Generally the condition of the labourer is better?—Yes.

35,138. His work, where he has service, is more permanent?—I do not know that that is so, that it is more permanent. That would only apply to cases where the houses are on the farm, and the farm requires a certain number of hands. But in farming generally the farmers employ a good many more hands in the summer than in the winter, whereas in the colliery works and ironworks they are working all the year round.

35,139-40. But you consider him more favourably situated than the farmer on hill farms?—I do.

Mr. R. Stratton. 16 Nov. 1894.

35,141. (*Chairman.*) I should like to put on the notes a paragraph in your pamphlet giving the reason for adopting what you call the gang system?—Yes.

The "gang" plough.

35,142. The part I wish extracted is as follows:—"I "would here say that my idea from the outset was to "adapt what is known as the 'gang' system to the "plough already mentioned, viz., making it so that "the ploughman could ride, if so inclined. Having "long considered this matter, I have come to the con- "clusion that ploughing, as hitherto practised, is "altogether too slow an operation; and my experience "goes to prove that if in these days you want work done "quickly, it must be done with the least possible "exertion to the individual who has to do that work. "Ploughing is always associated with the slowest "speed, heavy horses, heavy implements, heavy, slow "action in the ploughman. The necessity for all this "I am unable to discover, but the result of it is utter "demoralisation of men and horses. It may be said "that allowing ploughmen to ride is more demoralising "still. I differ from this view. Is it demoralising to "allow the driver of the mowing machine, the horse "rake, the reaper, &c., to ride? Why should he not "ride the plough as well? In winter he may be "unable to do so on account of the cold, then let him "get off and walk fast to keep himself warm; but in "summer, when the weather is hot and dust abundant, "it is absurd to expect anyone to walk fast with four "pounds of hobnailed boots on his feet for eight or nine "hours a day. The gang plough system has long been "used in America, where wheat appears to be pro- "duced more cheaply than anywhere else, and where "labour is dearer than, perhaps, in any other country "of the world. Here the labourer never seems to walk "after an implement if he can ride it, whether it be a "reaper, mower, drill, plough, or harrow; and I think "the Americans can be trusted to get work done as "economically as possible. Why, then, should our "chief operation on the farm be effected so slowly and "expensively"? And then you say:—"The mere "saving of so much cost per acre, however, is not all; "expedition is sometimes all-important. A good or a "bad crop may depend upon the fact of its being got "in properly in the nick of time, which it might be "impossible to do without means such as I have "described; success or failure may depend on this"?—Yes, that is quite true.

Cottages.

35,143. (*Mr. Little.*) One question about the cottages. You said that you were better off than most farmers in respect of the number of your cottages?—Yes.

35,144. They are part of your farm take?—Yes.

35,145. And you give them rent free. Have you found any objection on the part of labourers to occupy cottages under you as a condition of their service?—No. I would not be encumbered with the cottages at all if I had not them entirely under my control.

35,146. (*Mr. Dalton.*) How many cottages have you?—I have altogether about 24 cottages I think.

The witness withdrew.

Mr. J. H Nicholas.

Mr. J. H. Nicholas called and examined.

Mr. J. H. Nicholas.

35,147. (*Chairman.*) You are the secretary of the Technical Instruction Committee of the Essex County Council, are you not?—Yes.

Technical instruction in Essex.

35,148. Have the County Council made efforts to improve the education in agricultural matters in the county?—They have in different ways.

35,149. Can you describe what they have done and how they have spent the money allocated to them?—The amount of the money that came to Essex for the year was about 16,000*l.*; of that about 10,000*l.* was allocated to different committees for districts spread over the county. The county is mapped out into districts that have been formed for technical instruction under local committees; and the amount apportioned to those local committees has been at the rate of a penny in the £ on the county rate assessment making 10,000*l.* so apportioned. I have estimated that about 6,000*l.* of that money has gone to the urban districts.

35,150. You could not say anything with regard to the urban districts, but merely the rural districts?—Probably 4,000*l.* in the year has gone to the local committees in rural districts.

35,151. And what has it been spent on?—It has been spent on classes held in different parishes. I will hand in to the Commission the report of the first year's work, and also the report of the committee for the second year. In the second year the local committees arranged for 15 classes in bee keeping, garden, and fruit culture; 24 classes; ploughing, 10 classes; and in the rural districts about 60 classes in wood-work and manual training of different kinds, from rough carpentry as applicable to the farming industry, up to ordinary woodwork for the youths.

35,152. But they have classes in dairying?—Yes, the classes in dairying have been arranged by the central, not by the local committees; and the travelling dairy has been at work; this is the third year for it.

35,153. What has been done by the central committee?—The central committee have taken in hand the dairy work of the county; also they have established at Chelmsford central laboratories with two departments of biology and chemistry, and a staff instructor and an assistant for each of those departments.

35,154. What more have they done?—They have held classes, and arranged lectures in different parts of the county; and also they have had Saturday classes for elementary school teachers in chemistry and biology and woodwork.

Mr. J. H. Nicholas. 16 Nov. 1894.

35,155. What more?—They have also in connexion with the departments for chemistry and botany, had experimental plots carried on in different parts of the county, but owing to the drought they were not successful last year. That was done in connexion with the Agricultural Society—a joint experiment was carried on.

35,156. What sized plots were they?—Only a few acres in different parts.

35,157. What kind of experiments were they?—Some experiments in regard to barley and wheat and other plants.

35,158. (*Mr. Little.*) And certain manures?—Yes; but that has been carried on by the Essex Agricultural Society; and we made a grant to them of 50*l.* on condition that our instructors should be associated with them in their work.

35,159. (*Chairman.*) But last year they were not successful?—No.

35,160. And this year have they been carried on?—Yes, they are being carried on again.

35,161. With what result this year?—We have not the report upon that. We have very interesting experiments with pot cultivation in connexion with the chemistry department, and that was exhibited at the Agricultural Society's Show at Colchester, and it created a good deal of interest. It showed the effect of the artificial manures upon beans and wheat and other crops. They were simply grown in pots, and it was a source of very great interest at the show. We also took a party of farmers to Rothampstead to see the experiments of Sir John Lawes and Sir Henry Gilbert, and they were exceedingly interested in them.

35,162. What were those experiments?—Grass land, wheat, roots, and other crops.

35,163. Experiments in laying down land in grass?—Yes, and the effect of the manures on the different grasses; also the growth of wheat—the effect of manures on wheat as well.

35,164. They have not done anything in the way of experimental farms?—No, we have not commenced that.

35,165. Have there been any proposals to treat the derelict land in Essex?—No, we have not made any progress.

35,166. Has the question been considered by the central committee?—Not directly.

35,167. Have any proposals been made to the committee from that district as to what encouragement they could give or what kind of experiments they could make?—Except that it was suggested that experiments in laying down pasture should be made, but nothing really from that part of the county.

35,168. Has any advance been made in Essex in the way of creameries and co-operative dairy farms?—No, there have not been, not outside the council. There was a factory started at Colchester, but it was, I believe, not quite a success financially—a limited company; they attribute that chiefly to the fact of purchasing the milk from the tenants, instead of paying so much for the quantity of cream that was taken from the milk, and having the separated milk returned to the farmers.

Tithe.

35,169. (*Mr. Everett.*) You express in your brief your opinion that a revaluation of the tithe is wanted in the county of Essex, as to the reduction of the amount of it?—Undoubtedly.

35,170. Do you express that opinion after any study of the question particularly, or is that what comes to you from the farmers generally?—The notes which I had drawn up I have submitted for your consideration at the suggestion of the secretary, who was kind enough to ask me to come down to see him, and they are based in a great measure upon the opinion of farmers and others connected with land in the county, and living in the county of Essex. The depression is the chief topic of conversation at the present time, and as to its ruining farmers. These points are continually cropping up at every meeting, and the paragraphs in my brief contain the more general views which are not of a debateable character, as it seemed to me, in which some relief might be given to the farmer at the present time.

35,171. The tithe is at present felt to be a very grievous burthen in the present state of agriculture?—It is very heavy; in fact the tithe on some farms is as much as 10*s.* an acre.

Mr. J. H. Nicholas. 16 Nov. 1894.

35,172. And the land tax also, there is a complaint of that there?—The land tax is as much as 4*s.* in the £ upon the assessment of agricultural land in some parts of the county. Of course it varies very much. In some places it is 4*s.*, and in other places it is very small, because the land tax you understand is a fixed sum charged upon the whole parish.

Land tax.

35,173. In regard to light railways, have you any practical knowledge of the cost of them?—I have no practical knowledge.

35,174. (*Captain Owen-Thomas.*) Have you had any experience of agricultural matters?—None, except being a solicitor, I have been in connexion with certain estates, not very large ones, and the depression in connexion with them.

35,175. You have not been farming?—No.

35,176. Are you managing an estate?—No, I am not.

35,177. How have you formed your opinion? After hearing others?—Yes, in a great measure. Agriculture is the chief industry in Essex; outside the urban districts of course it is a matter of common talk; and being connected with the county, and meeting the farmers in the County Council, and knowing what I do of some of the different estates of the county and their reduction in value I gather my ideas chiefly from them. I felt somewhat a delicacy in submitting myself for examination on this difficult subject.

35,178. (*Mr. Dalton.*) You advocate the allocation of a Government grant for the establishment of creameries in villages?—Well, with this view ——

Technical instruction.

35,179. Do you mean that you should be authorised to apply to this purpose your present funds for technical education?—No. They are not quite sufficient for technical education for the whole county as it is.

35,180. What do you get from the technical funds?—16,000*l.*

35,181. And you only use 6,000*l.* for the urban districts and the rest goes to the rural ones?—Yes, of the amount allocated for local grants.

35,182. (*Viscount Cobham.*) Does any of it go in relief of the rates?—No. We expend the whole 6,000*l.* in scholarships and grants, and the endowment of schools in the county, and on our laboratories at Chelmsford, which cost about 1,500*l.* at least a year, including the staff instructors and apparatus.

35,183. (*Mr. Dalton.*) You apply it all in technical instruction?—Yes.

35,184. And do you raise any rates besides for technical education?—No, we do not.

Manual training.

35,185. (*Mr. Whitehead.*) You say you have manual training, what does that consist of?—It varies very much; woodwork and manual training. It is in some places plain carpentry, and in others rough carpentry, such as the making of ladders and rough things for farming. That is an exception, and is only done in a few cases as an experiment; but for plain carpentry there is a good deal done in connexion with the city and guilds' courses for manual training.

35,186. (*Viscount Cobham.*) Have you sent any teachers to Germany?—We sent two teachers for the Sloyd woodwork; they have come back, and are training teachers for us; but we have converted the Sloyd woodwork into the city and guilds system; we find the Sloyd woodwork is good enough for children up to 10 or 11 years of age, but after that they want something different.

Instruction to labourers.

35,187. (*Mr. Whitehead.*) Do you give any strictly technical agricultural teaching to labourers and small farmers?—What do you call strictly?

35,188. Hedging and ditching, &c.?—No; but ploughing. There was a competition last autumn where 60 ploughmen and farming youths in one centre competed, after having received eight lessons.

Dairy instruction.

35,189. What has been the result of your dairy teaching?—In what way do you mean?

35,190. As to the result of it, as to the improvement in the quality of the butter?—At the competition for the whole county at the last show, where Mrs. Lord was the judge—I will read from the report—"Mrs. "Lord expressed herself as much pleased with the "work done as being, in her opinion, far beyond an "ordinary competition, and more like that to be seen

Mr. J. H. Nicholas. 16 Nov. 1894.

"in a dairy county such as that of Somersetshire. "She considered that the county council and the "teachers ought to be congratulated on the improve- "ment in butter making in Essex." Essex is not a butter making county at all, and we consider that there has been a great improvement in the butter. In fact, it is generally acknowledged. Now we have gone in for cheese making.

35,191. Do you teach dairying by a travelling dairy?—Yes; but now we have made a centre at Colchester, we are trying that and sending pupils for a month's training who are taught cheese making as well as butter making at our dairy school there. It was said that we could not make cheese in Essex.

35,192. (*Viscount Cobham.*) What are the pupils charged?—The pupils are charged 10*s.* a week for board and lodging and 10*s.* a month for their fees.

Technical schools.

35,193. (*Mr. Whitehead.*) You spoke of the establishment of technical schools as being desirable in the county; is that the opinion of agriculturists, or is it your own opinion?—It is the opinion of some of the active agriculturists that such a thing would be an advantage in the county. To what extent it is rather difficult to say. They think experiments should be made in different parts of the county with regard to pastures, and, possibly, experimental farms, but if so it should be started on a moderate scale.

35,194. Is it likely that such a station will be established?—I am afraid that it will not be established unless there is some grant from Government in some way or other to assist. Whether it would be worked in connexion with the laboratories at Colchester where we have chemistry and biology, I hardly know; we have not enough money to do it ourselves.

35,195. (*Viscount Cobham.*) Do you charge fees generally for the instruction given?—In some cases we do. We do not charge fees for those who attend the central laboratories for chemistry and biology, and we pay the travelling expenses of those who attend them, so that it is practically free.

Agricultural lectures.

35,196. You have got no general agricultural course of lectures I understand, have you?—Except those arranged for by our staff instructors in their syllabus.

35,197. On soils and stock?—There is a general bearing upon it in the courses in the syllabus that I handed in to the Commission.

35,198. Have you a travelling lecturer?—We have one, but he takes classes as well at the central station at Chelmsford where the laboratories are. There is one class specially for farmers.

35,199. How have your classes succeeded on the whole?—This year, those who come to the central classes at Chelmsford, seem far better and more interested, and we get a larger number of tenant farmers than before. It is very difficult to get the farmers in Essex to take any instruction.

35,200. They do not much believe in theoretical teaching?—Not very much; the experimental farm and the experimental plots, they seem to take to much better.

35,201. But you are going on with the system of agricultural lectures?—Yes, and it is improving, decidedly.

Lecturers.

35,202. How do you get your lecturers, how have they been provided?—By nomination and selection. When we decided to have a lecturer on biology, that was the first, it was referred to a sub-committee, and we happen to have a very good committee with Sir Henry Roscoe, Mr. Shenstone, Mr. Spiller, Professor Meldola, and Professor Stuart added outside the Council, and in a great measure, through those gentlemen, we were able to get two very able men, Mr. Houston and Mr. Dymond.

35,203. You got science teachers then from London?—Yes.

35,204. With regard to dealing with agricultural lecturers, do you not find a great difficulty in finding competent men?—We have not what you would call an agricultural lecturer outside those two men. Teaching agriculture, as agriculture, does not do at all, because farmers know more about it practically than the lecturer sent down to them. It was thought at first best to teach biology and chemistry, and then it might do to have special agriculturists to build on to the top of their work.

Mr. J. H. Nicholas. 16 Nov. 1894.

The agricultural grant.

35,205. Have the farmers in the county been pretty well satisfied with the administration of the agricultural portion of the grant?—A great many of the farmers do not trouble themselves much about it. I hardly think that they consider it does a great deal for agriculture, but what more can be done in the shape of teaching it is difficult to know. We have offered scholarships to take them up to the Agricultural College at Cambridge, and advertised them well, but we cannot get a farmer's son to go there; and we have also advertised to give scholarships to send them to an agricultural college, but we have only had one application.

35,206. Is there much pressure upon the county council to devote the whole or part of the money to the relief of the rates?—There was last year; it began at one of the boards of guardians and ran quickly through to the different rural boards, and they passed resolutions. At the Chelmsford Board they adjourned the question, and gave notice to every guardian that it would be considered at the following meeting, and after a very strong debate they carried a resolution against appropriating it to the rates, saying that it should be continued to technical instruction, and when it came before the council there was not one there to support the idea that it should be devoted to the rates at all.

35,207. Have you any suggestions for the better administration of the Agricultural Grant?—No. I think if we have a thorough inspection of those local committees it will very materially assist us in getting probably better classes and getting more efficient work; but I have no suggestion to make to alter the principles on which we have been acting.

35,208. Do you think you have got adequate results from the money expended?—I think we have considerable results, as much probably as one might expect, and I hope we shall have increased results. It was a most difficult thing to arrange for technical instruction in the counties at a moment's notice. It has to find its own legs and everything else.

Technical instruction in national schools.

35,209. (*Mr. Dalton.*) You have not found any legislative difficulties in the way?—Except that we do wish to get closer in touch with the elementary schools, we want the Local Government Board to move, and the Education Department, with the view of allowing technical instruction being given to children who have passed the compulsory standard and have not left school.

35,210. But I mean as to the application of your grant; do you wish to apply any part of your grant for the purpose?—Yes, beyond the Fourth Standard, and where the parents are anxious to keep them on at school, to the Seventh Standard. We are not allowed to give that child instruction because he is at school; a child who has left school may not be as good a child, and he is allowed to attend the classes whilst the other is not.

Gardening instruction.

35,211. (*Viscount Cobham.*) Have you a special gardening instructor?—No, not one retained for the whole county. We have several gardening instructors for different local committees engaged at different places. In some cases they inspect the gardens and allotments and give a lecture.

35,212. Do they actually show the cultivators how to prune and graft?—It has been done by some of the lecturers; they very often take some parts of small trees into the hall where they give the lecture and show how it is done there. But there is one man I know who has gone into the gardens and shown them how to do it.

35,213. Is that instruction a good deal appreciated?—Yes. In certain cases it has been appreciated almost as much as anything—the horticulture; they have very good audiences.

35,214. Do they inspect allotment gardens as well as cottage gardens?—Yes. He has inspected cottage gardens, and the same would apply to poultry.

35,215. Are they local men?—No, not local men; we have one local man who has come out within the last 12 months, and he is a member of the Horticultural Society.

35,216. And I suppose you engage them for a limited time?—Yes, so much for a course of lectures.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Sixty-fourth Day.

Thursday, 22nd November 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
ALAN MACKINNON, Esq., } *Secretaries.*

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

Mr. RICHARD FINNEY and Mr. SAMUEL OSBORNE called and examined.

35,217. (*Chairman to Mr. Finney.*) You are chairman of the Derbyshire Dairy Farmers' Association, I believe?—I am. I am also a member of the Leicestershire County Council, and Mr. Osborne, who is with me, is a member of the Derbyshire County Council.

35,218. Are you a farmer yourself?—Yes.

Description of witness' farm.

35,219. What size farm have you?—I farm 435 acres.

35,220. In what part of the country?—Leicestershire. I should like to explain that the Derbyshire Dairy Farmers' Association has its centre in the town of Derby. The town of Derby is within a few miles of the border of the county, and it takes in a large area of Leicestershire and also of Staffordshire.

35,221. You just come within range?—Yes.

35,222. I suppose the system of cultivation is the same?—It is pretty much the same, but we get a little more arable land in Leicestershire and Staffordshire than they do in Derbyshire.

35,223. How long have you held your farm?—Since 1866.

35,224. Has there been a reduction of rent upon it?—Yes.

35,225. What has that been?—It has varied. There have been two or three reductions on that farm.

35,226. What does the reduction amount to now?—About 100*l.* a year.

35,227. What is the present rent?—I have two farms; the rent of one is 34*s.* with a house, and the other 26*s.* with a house.

35,228. Has the reduction been at about the same rate in both?—Yes, at about the same rate.

35,229. Has it been about 25 per cent. or 30 per cent. or what. I want to get a rough idea of the proportion?—I should think about 15 to 20 per cent.

35,230. Is it a pasture farm?—About two-thirds pasture and one-third arable.

35,231. Is it very much the same as the farms in the district?—Yes, with the exception of the northern part of Derbyshire, there it is principally grass.

Reduction of rent.

35,232. Has the general reduction of rents been from about 10 per cent. to 30 or 33 per cent.?—I may say that the Derbyshire Dairy Farmers' Association made inquiries amongst the whole of its members; they sent out a circular which perhaps I might hand in (*handing in print of circular*); and we got a great number of replies to it. I think I may say that there are rather over 600 members of the Derbyshire Dairy Farmers' Association, and that we got 155 replies, which we have had tabulated.

35,233. What was the result as regards rent?—The result as regards rent you will have in the evidence that I shall give when we get on to the question of rent. We have tabulated those replies according to the circular you sent out.

35,234. Would you say the reduction has varied from 10 per cent. to 33 per cent.?—Yes.

35,235. I presume, according to the nature of the farm?—Yes, the locality, and a lot of other things; the distance from a station or town is also a very important matter just now, especially in the milk trade.

35,236. Then we may take it that in the case of those farms which are near to stations or near to towns, the reduction of rent has been much less?—Yes, they have been better to let.

35,237. Have the landowners generally met their tenants?—Yes, they have met them in every way I think they possibly can.

35,238. And made permanent reductions?—Yes, generally.

Assessment to rates.

35,239. Have the tenant farmers had the benefit of those reductions in their assessments for the local rates?—Yes, they have most of them taken the advantage of getting the assessment of the farm reduced accordingly; I should say that all of them have done that.

35,240. Would you say generally that they have obtained full advantage of the reductions on their rent in the reduction of their assessments?—Yes.

Condition of farmers.

35,241. Then with regard to the condition of the tenant farmers, what have you to say?—Where the tenant farmer has the ability, and a sufficiency of capital, he has not suffered more than other classes. In Derbyshire the farms are comparatively small, and chiefly grass; they have suffered materially; there is no doubt the tenant farmers of Derbyshire as a class are not so well off as they were.

35,242. Profits are not so large as they were?—No, they are very much diminished.

35,243. Still are they holding their own?—They seem to get on the best they can.

Average rent.

35,244. What should you say the rent now averages in that district per acre; you said in your own case it was from 26*s.* to 34*s.*; would that represent a fair average of the district?—I think the average would be rather higher than that. (*Mr. Osborne.*) About 30*s.* I should think would be about the average.

35,245. After the reduction?—Yes. (*Mr. Finney.*) After the reductions at the present moment. (*Mr. Osborne.*) I have no doubt, as far as those 155 who have sent us in returns, you would have the average stated in the table we have prepared.

Size of farms.

35,246. Are the farms generally small and chiefly grass?—(*Mr. Finney.*) They are small compared with what they are in some parts of the country. I see the average size of the 155 returned was 170 acres.

35,247. What is about the smallest amount a man can live upon there?—I do not know; "to live upon," that is rather an awkward question, because, as a rule, the small farms are occupied by men who do other work, who have either some kind of business or do something else in conjunction with it.

35,248. At what point do they begin wholly to live upon the farm?—I should say at not less than 40 acres.

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

35,249. Are there many farms in your district of from 40 to 100 acres?—Yes.

35,250. A good many?—Yes, a good many from 40 to 100 acres.

35,251. Occupied by men living wholly on their farms?—(*Mr. Osborne.*) A good many of that class of farmers endeavour to assist themselves by carrying to market, or by doing some other cartage, or something else. (*Mr. Finney.*) They do something besides.

35,252. I am wishing to find out at what point you think that a man could live wholly by his farm?—(*Mr. Osborne.*) That class of men I should consider worse off than the regular labourer; they work harder and they live much harder. (*Mr. Finney.*) They do all the work on the farm themselves. I should say it should be not less than 50 acres for a man to live on the farm.

35,253. Are they dairy farms?—Yes.

35,254. Then we may take it there is a considerable number of men holding from 50 acres to 100, who are living wholly on the land?—If you said living entirely on from 50 acres to 100, I think you would be well in it there.

35,255. And working themselves?—Yes, and their families.

Labourers.

35,256. Then with regard to the agricultural labourers, what have you to say about their condition?—Their condition in our district has materially improved in my time.

35,257. Since when?—I was looking back for about 30 years—say less than that. Within the last 25 years their condition has materially improved, and wages are very much higher than they were.

Wages.

35,258. When did the rise of wages begin in your district—about 1873, was it?—No, there was a little rise of wage before 1873, in the sixties. I should think we began to pay more wages about 1868.

35,259. Then there was another rise about 1873, was there not?—Yes, there has been a gradual rise up to within the last two or three years.

35,260. Have they remained stationary since that?—They have remained stationary.

35,261. They have not fallen?—No, they have not; or if they have fallen, it is so little that it is not worth mentioning.

35,262. What do the wages now amount to?—I think agricultural labourers get an average wage of 18*s.* weekly, that is taking the whole of the year.

35,263. What were they, should you say, 25 years ago, at the time with which you are making a comparison?—At that time I paid the same men instead of 18*s.*, 12*s.*, and they would get a little extra for harvest, so that I should say their wages would be about 13*s.* to 14*s.*

35,264. Then the labourers in your district have had the benefit of this rise from 13*s.* or 14*s.* up to 18*s.*?—Yes.

35,265. Besides the improvement resulting from low prices?—Yes; their condition, as I said before, has materially improved.

35,266. (*Mr. Little.*) When you say wages, do you mean earnings?—Earnings.

35,267. Therefore you included extras for harvest and the perquisites?—What occurred to my mind was this, that I was paying men so much per week all the year round, and so much extra for harvest, which comes to so much per week all the year round. (*Mr. Osborne.*) We included the perquisites in the 18*s.* I might say that mine are getting about 1*l.* a week.

35,268. (*Chairman.*) I suppose the higher rate of wages has been one cause of difficulty with the farmers?—(*Mr. Finney.*) Yes, with the low price of produce.

35,269. The labour bill is very high?—Yes, it is very high.

35,270. Why is it that the wages are so much higher in your district than in many other parts of the country?—We have a good deal of railways in the district, and they take up a good many men. Then we have works of other descriptions in the shape of breweries, and other large works, which take up pretty much the same class of men that you would like to see employed on the farm.

35,271. You find yourself in competition with other employers?—Yes.

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

35,272. And that has tended to raise the wages?—Yes. (*Mr. Osborne.*) There is another point; that is, that on the dairy farms our men have to come considerably earlier than they do in other districts for the milking. They would have to come at 5 o'clock in the morning, and they would have to attend perhaps twice on Sundays to milk.

35,273. That has to be taken into account in making a comparison?—Yes.

Reduced labour.

35,274. Has this increase in the rate of wages tended to induce farmers, as far as they can, to cut down the labour bill by employing fewer hands?—(*Mr. Finney.*) Yes, it has.

35,275. By laying down to grass?—Yes.

35,276. And by somewhat neglecting the fences, we will say?—Yes; in fact I think I may venture to say, that instead of the farmer at the present time looking round the farm, and finding out work that can profitably be done; I think he is looking round the farm to find something that need not be done—something that may stand over.

35,277. Are any labourers unemployed in your district?—Very few.

35,278. Then the surplus labour caused by the reduction in the number of labourers employed by the farmer has been absorbed in other businesses?—Yes; in other ways.

Wages.

35,279. And no difficulty has arisen in consequence?—No; I have not perceived any. I am just reminded that there is no disposition to complain of the amount of wages; all that we complain of is the low rate for which we have to sell our produce; we do not think the wage is too high.

35,280. I quite understand that; you have to submit to the market rate, and I daresay you are not sorry that the men should get what is a proper wage?—No.

35,281. You pay what you consider to be a fair rate having regard to what the men can get?—Yes.

35,282. And you do it without complaint?—Yes.

35,283. But necessarily many farmers find themselves compelled to employ as few hands as they can?—Yes; that is so.

35,284. Do not suppose that I was for a moment suggesting you had any complaint?—No, I did not; only I was rather reminded of that point.

Uncultivated land.

35,285. Has any land gone out of cultivation in your district?—I do not know of any. I think when we made this inquiry, we did not find a case in which any land had gone out of cultivation.

Demand for farms.

35,286. When farms are vacant are they easily let?—Small and moderate sized farms there appears to be inquiry for, and they let; in fact, I do not call to mind any farms in the neighbourhood that are unlet where the owner wishes to let them. (*To Mr. Osborne.*) Do you?—(*Mr. Osborne.*) No; I might say that I have been on Lord Scarsdale's estate for 17 years, and during that time he has never had a farm on hand.

35,287. And none now unlet?—He has three to advertise to let, but he has never had one on hand during the 17 years I have been on the estate.

35,288. I suppose they have them on hand sometimes at the end of a tenancy in order to put them in order and to re-let them?—(*Mr. Finney.*) Yes; but not very much of that.

35,289. Not much?—Very little.

35,290. Would you say that the farms will let fairly in your district?—Yes; there is a fair demand for them.

Land laid down to grass.

35,291. Has much land been laid down to grass?—Yes; there has been a good deal. I may say that in the greater part of Derbyshire the land is strong land, and that class of land has gone down to grass.

35,292. Do you mean by strong land that it is heavy clay?—Heavy land to work.

35,293. How many horses does it take to plough it?—In some cases four, but as a rule, three, I think. (*Mr. Osborne.*) Three horses.

35,294. Does it lay down to grass easily, or no?—(*Mr. Finney.*) Yes, fairly well, if the land is properly treated.

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

35,295. What should you say it costs to lay down the land to grass?—Do you mean the seed bill?

35,296. How much would you, say taking into account manure, and that sort of thing?—I do not think you can do it for less than 5*l.* an acre. (*Mr. Osborne.*) I think that would be quite under it if you mean by the term "laying down"; the expense of laying it down properly, that is putting some good seeds on to it and following it up, because you see after two years it begins to go back unless you follow it up with the manure cart every year.

35,297. After two years all goes back?—Yes, unless you apply something to it such as feeding stock with cake on it.

35,298. But taking everything into account you would say it costs 5*l.* an acre?—I should say that.

35,299. How long a time is it before you can say it is fair grass?—(*Mr. Finney.*) That varies so much on different lands, I should say from 10 to 15 years.

35,300. As much as that?—Yes; I was just thinking of some of my own land as a guide. It has been down 9 and 10 years, and that keeps improving yearly. I should say from 10 to 15 years. (*Mr. Osborne.*) Everything depends on the after treatment as to how long it is going down and getting into good turf.

35,301. Have oats been substituted for wheat in the arable land?—(*Mr. Finney.*) Yes, principally.

35,302. I suppose the farmers in your district buy a good deal of feeding stuff?—Yes. One reason why oats have been used is that the straw is of more value to cut up for cattle; besides wheat has been so low in price.

Purchase of feeding stuffs.

35,303. You say that they buy a good deal of feeding stuff?—Yes, they do.

35,304. Do you suppose they buy as much feeding stuff as they sell now on the average in your district?—In a good many farms they buy more; on the grass farms, which are the principal farms, they buy more.

35,305. Of course, they buy a great deal?—Yes. On the arable farms such a farm as my own with a third arable I should not buy more; I should sell more than I buy.

35,306. Still you do buy?—Yes. I buy cakes and that sort of thing.

35,307. I suppose the grass farmers have benefited considerably by the low price of feeding stuffs?—Yes. They have had advantages there.

Changes of tenancy.

35,308. Have the changes of tenancy been frequent?—More frequent than since I can remember, but considering the circumstances not so frequent as we might have expected.

Milk-selling.

35,309. Has milk-selling taken the place of cheese-making?—Yes, almost wholly with the exception of those farms that are too far away from a railway station.

35,310. And in the case of those farms that are far off from the station has cheese-making taken the place of arable cultivation?—Cheese and butter.

Consumption of home-grown corn.

35,311. Is there much home-grown corn consumed on the farms now?—Yes, I think the greater part of these oats that we speak of are consumed on the farm. (*Mr. Osborne.*) Very few are sold, especially at the present prices.

Rural depopulation.

35,312. Would you say in consequence of the reduction in the number of labourers that there has been some depopulation of the rural districts?—(*Mr. Finney.*) Yes.

35,313. What does that amount to?—From 5 to 10 per cent.

Spending power of labourers.

35,314. Then you also conclude that the spending power of the owner has decreased, while the condition of the labourers has improved 20 per cent?—Yes.

35,315. By that 20 per cent. do you mean in money wages or in what they can get for their money?—The two combined. You see all the necessaries at the present time are very cheap.

Fall in prices:

35,316. Has foreign competition reduced the price of your own produce?—Yes.

35,317. How much should you say?—We take it at from 30 to 50 per cent.

(*a.*) Beef.

35,318. What kind of produce are you speaking of now?—You may take beef and mutton. (*Mr. Osborne.*) The price of beef in 1893 averaged 6*d.* per lb. as against $7\frac{7}{16}d.$ in 1883.

35,319. There had been a considerable rise between 1873 and 1883 in the case of beef, had there not?—(*Mr. Finney.*) Yes, but we started in 1883 in our own return.

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

35,320. But going back a little further, do you recollect what the price was, say in 1873?—No. I should not think 1873 would be dearer than 1883, would it—as far as my recollection goes.

35,321. Of course, there may have been a rise in 1873, but from 1870 would there be a considerable rise?—No. I do not think the price in 1870 would be higher than in 1880.

35,322. Then cheese?—That has gone down a good deal.

(*b.*) Mutton.

35,323. Now take mutton?—(*Mr. Osborne.*) In 1893 it averaged $6\frac{1}{2}d.$ per lb., as against $8\frac{1}{4}d.$ in 1883. (*Mr. Finney.*) I may say that mutton is dearer at the present moment. This return was made for 1893 at the commencement of this year, these figures were taken in 1893, but mutton is dearer now.

35,324. What does it come to now, because in 1893 the price was exceptionally low, in consequence of the drought, was it not?—The average price for mutton I should say would be from 7*d.* to $7\frac{1}{2}d.$; it would be a penny more than we have it for 1893.

35,325. What is the present price of beef?—It is a shocking price; it is a wretched price—about 5*d.* (*Mr. Osborne.*) 5*d.* to 6*d.* (*Mr. Finney.*) The best heifers are not worth more than 6*d.* It is from $4\frac{1}{2}d.$ to 6*d.* in the Derby Market, which is wretched.

(*c.*) Cheese.

35,326. As to cheese?—(*Mr. Osborne.*) The present price of cheese would be from 40*s.* to 50*s.*

35,327. What period do you compare with?—Going 20 years back it was some 60*s.* to 80*s.*—in fact, I sold cheese myself at 82*s.*

35,328. (*Mr. Lambert.*) Would those figures of 60*s.* to 80*s.* be average figures of, say, 10 years ago, or would the 82*s.* that you have mentioned be only an exceptional price fetched at an exceptional time?—That would be about the year 1873 or 1874.

35,329. Would it be an average?—It would be from 70*s.* to 80*s.* in that year which I am speaking of. At the time I was making cheese, and I made cheese for six years, I never sold for less than 60*s.* during that six years.

35,330. (*Mr. Little.*) When did that period end?—That would be about 1877.

(*d.*) Butter and milk.

35,331. (*Chairman.*) Then take butter and milk, have they gone down?—Butter I consider has gone down from pretty well 1*s.* 2*d.*, and 1*s.* 10*d.* which used to be the winter price. It has been up to as high as 2*s.*, but I have not taken either the extreme in the lowest or the highest. Now you may safely say that it is at 10*d.* to 1*s.* 4*d.* There has been plenty of butter sold this last summer in Derby market at 8*d.* and 9*d.* per lb.

35,332. What is it now?—The market price would be about 1*s.* 2*d.* and 1*s.* 3*d.*; about 1*s.* 3*d.* you might say is the average. The best quality which we make ourselves, or Lord Vernon's factory butter, is 1*s.* 6*d.* to retail.

35,333. Is that on Lord Vernon's estate?—Yes, at Sudbury.

35,334. (*Sir Nigel Kingscote.*) The factory there?—Yes, it is factory butter. (*Mr. Finney.*) I may say that Mr. Osborne makes butter in pretty nearly the same form. (*Mr. Osborne.*) My own is the same price.

35,335. (*Chairman.*) Do you say that the retail price of factory butter is 1*s.* 6*d.*?—In Derby.

35,336. (*Mr. Lambert.*) What is the price of ordinary butter?—I do not think the average price would be higher than 1*s.* 3*d.* in the market.

Sudbury dairy factory.

35,337. So that the factory butter would command 3*d.* per lb. more than the ordinary butter?—Yes.

35,338. Is that due to the uniformity of the make?—Yes; I think we may say so; to the better manufacture of it.

35,239. The better manufacture of it?—There is more uniformity about it. I find no difficulty in selling my own as long as I make so much, as I consider first-class quality. My customers, although they may grumble a bit sometimes, still they will have it.

35,340. Is Lord Vernon's factory confined to his own tenants, or is it open to the whole district?—Do you mean the supply of the milk?

Mr. R. Finney and Mr. S. Osborne. 22 Nov. 1894.

35,341. Is it a factory merely for the estate or for all the surrounding farms?—It is a company now.

35,342. And buys milk from all the farmers about?—Yes, within a great radius. I must say it has not been a benefit to the farmers on the estate for a long time.

35,343. It has not been?—No.

35,344. Why is that?—Because of the very poor price they give for the milk.

35,345. Do you think they would be better off making the butter themselves?—A good many of the farmers have sold their milk away, and have not sent it to the factory; they have sent it to London or elsewhere instead.

35,346. They found they could get a better price?—Yes.

35,347. (*Sir Nigel Kingscote.*) As I understand, that is your case?—I am speaking of Lord Vernon's factory now.

35,348. (*Chairman.*) But, still, apparently from what you say, the butter, when it is manufactured in that factory, fetches rather more than the average market rate?—Yes; it is a higher rate both for butter from that factory and from the Egginton factory too.

35,349. (*Mr. Clay.*) What price do you get for sending it up to London, per gallon?—The average would be about 6¾*d.* this year.

35,350. What is your railway charge?—That is net; the carriage is 1*d.* per gallon or 1*s.* 4*d.* for a churn, that is eight barn gallons. One gallon is carried free in that case; you get a churn carried for 1*s.* 4*d.* instead of 1*s.* 5*d.*

Rent.

35,351. (*Chairman.*) When one considers the reduced price of produce and the higher wages you have to pay, I do not quite understand how you can pay the same rents that were paid apparently in your district?—(*Mr. Finney.*) There has been a reduction, you see.

35,352. Still, the rents are not low as compared with many other districts we have inquired into; as they average 30*s.* per acre they seem to be very fair rents?—Yes. (*Mr. Osborne.*) When I first took my farm it was 48*s.* 9*d.* per acre: I had another 100 acres added to it, and that was two guineas an acre. Since that I have had a reduction of 10 per cent.

35,353. What is it now?—It would run about 37*s.* 6*d.* per acre; there is one-fifth arable.

35,354. Do you hold under a yearly tenancy?—Yes.

Farm buildings.

35,355. (*Mr. Little.*) The buildings are considerable, are they not, on those dairy farms?—Yes, we have a fair amount of buildings.

35,356. I mean, they lock up a good deal of capital?—Yes.

Farmers' capital.

35,357. (*Chairman.*) What do you consider is the amount of capital per acre a farmer ought to have in your district?—He ought to have 10*l.* an acre.

35,358. I suppose that is rather above the average?—(*Mr. Finney.*) Yes. (*Mr. Osborne.*) That would be above the average, but if he could get that all the better. In the case of my farm, I spend as much on cake, and corn, and manures—in fact, I spend more—every year than I pay in rent.

Price of feeding stuffs.

35,359. Then I suppose you have benefited by the low price of cake and feeding stuffs?—Yes, it has been a benefit in that way, for, of course, I purchase more than I sell.

Effect of the drought, 1893.

35,360. Did the drought of last year seriously reduce the price of stock?—(*Mr. Finney.*) Yes, materially, especially in the southern part of the county. The northern part of Derbyshire had a fair grass season, but the southern part and the adjoining counties of Leicestershire and Staffordshire suffered very much. We came to the conclusion that stock was depreciated something like 25 per cent. last year; it is dearer now than it was then.

35,361. Were the farmers obliged to sell off a good deal of their stock on account of it?—They very wisely kept what they could, and they used everything they had on the farms; even the stuff that they ought to thatch their stacks with this year had to be made use of for fodder.

35,362. This year, I suppose they have had a very good hay harvest—where they have had good grass?—Yes, it has been a fair season.

35,363. Has the value of stock gone up again?—It is higher than it was last year. (*Mr. Osborne.*) Especially the down calving cows. That I should attribute, in a great measure, to the scarcity of keep, a good many cows that ought to have been what we term cross-bulled to come down this autumn, were slaughtered or sold off.

Mr. R. Finney and Mr. S. Osborne. 22 Nov. 1894.

Price of stock.

35,364. But this year there is a scarcity?—Yes, I should say the down calving cows are 3*l.* a head dearer this time than they were last year.

Farmers' capital.

35,365. Should you say that the farmers in your district have insufficient capital through losses sustained in farming, and consequently have insufficient stock on the land?—(*Mr. Finney.*) Yes, there are farms which would do with more stock.

Deteriorated farming.

35,366. Taking land generally, is it poorly kept, or is it kept up to a fair average?—I think it is kept up to a fair average. I do not think there is very much deterioration. (*Mr. Osborne.*) There is not much deterioration as regards the condition of the land for its produce, because in dairy farming you have to use so much stuff, but still the farms are rougher and untidy.

Rates.

35,367. Has there been an increase in the rates?—(*Mr. Finney.*) Yes.

35,368. Can you give us an illustration of that?—The poor rate has not materially altered in the union in which I reside.

35,369. What is your union?—Sharldow. The sanitary rates are inclined to increase.

35,370. What is the poor rate in the pound?—Do you mean including the county rate, because the rates are collected all together.

35,371. Then what is it altogether?—For this half year I believe it is 6*d.*; that includes the county rate.

35,372. And for all rates?—No, for there are also the sanitary rate and the school board rate.

35,373. What is the sanitary rate?—Of course that only applies to parishes where sanitary improvements have been made.

35,374. Is there a sanitary rate in your parish?—No, in the adjoining parishes there happen to be sanitary rates, but in the parish where I reside we have none. We have a school board rate.

35,375. What is the school board rate?—6*d.* I have always felt, as regards the school board rate, that it acts rather heavily on agricultural land. I have rather an impression that the land might be relieved of it, because it does not put children into schools in the same degree that houses do.

35,376. Taking all the rates together in your parish, what do they amount to about?—For the present year 2*s.* 6*d.* in the pound.

35,377. Is that higher than it was a few years ago?—Yes.

35,378. How much?—Not very much. There is an increase in the school rate.

35,379. Is it more than the increase in the school rate—the 6*d.*?—I do not think there is that increase in my parish.

35,380. Then there has been some reduction in the amount due to the reduced assessment?—Yes, the assessments in most parishes on agricultural land are gradually being reduced.

35,381. Should you say that, taking into account the reduced assessment, you pay more than you did, or no?—Yes, I think we pay more than we did.

Tenure.

35,382. Are the tenancies in your district chiefly yearly tenancies?—Yes.

35,383. Are the landowners ready to give leases?—I do not think they are ever asked for them.

The Agricultural Holdings Act.

35,384. The tenants prefer holding by the year?—Yes, they prefer yearly tenancies.

35,385. Do you consider any changes should be made in the Agricultural Holdings Act?—Yes, it is rather suggested that there might be a little improvement there.

Compensation for home-grown corn.

35,386. What do you suggest?—The Act requires amending, so as to include compensation for home-grown corn. No restrictions, in our opinion, should be imposed as to the methods of cultivation of land, so long as it is well farmed, except that on the determination of a tenancy it should be left in a suitable rotation

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

for the incoming tenant, in accordance with the custom of the locality.

35,387. What is the case now; are there restrictions?—Yes, there are restrictions.

Restrictions.

35,388. Have they been adhered to during the last few years?—No, I do not think they have.

35,389. Not?—No. I may say that where the tenant is expected to consume the whole of the produce on the farm, so long as the farm has been fairly farmed I do not think the landlord has objected to a stack of hay or straw being sold off the farm. (*Mr. Osborne.*) It is generally done by application to the agent or landlord. (*Mr. Finney.*) I do not think there has been any difficulty there.

35,390. (*Chairman.*) You say in your brief that the distraint for rent should not exceed 12 months; it is so now, is it not?—Yes; we do not recommend any alteration there. Might I go back to the rates and taxes?

Land tax.

35,391. Yes?—There was a point I rather missed; that is a question of the land tax, which seems to be rather a heavy burden with us.

35,392. That falls on the landowner, I suppose?—No, the landowners, as a rule, let their land subject to the tenant paying the land tax, but still it is a charge on the land.

35,393. It is a very unusual practice?—It is not unusual in our district. (*Mr. Osborne.*) It is usual in Derbyshire for the tenant to pay the land tax.

35,394. (*Mr. Lambert.*) Does he not take that into account when he takes the farm?—He should do, naturally.

39,395. (*Chairman.*) Does he not deduct it from the rent?—(*Mr. Finney.*) No, he pays it separately.

35,396. What is the land tax in your district?—It is about 1*s.* an acre, but then it is a charge on the land, and we feel that as all kinds of produce are imported free, that instead of this land tax being used by the Imperial Exchequer, it would be a fair thing for it to be applied towards the rates in the parish. In the parish where I reside the land tax is 83*l.*

35,397. Is there much of the land in your district where the tax has been redeemed?—A little.

35,398. Then it would be very unequal in its operation?—I do not think it would because there is an income arising from the money that is paid for the reduction of the land tax, and that might be used in the parish for local purposes. I think it would be only fair if that were so.

35,399. Some parishes would get a good deal then, and some nothing?—Whatever the amount is on the parish.

35,400. (*Mr. Little.*) Would you say how much this 83*l.* represents on the rateable value?—I think the present land tax is either 8½*d.* or 8¾*d.* I feel rather strongly on that point. Under all the circumstances that we are met with, with all kinds of foreign produce coming here, I think that 83*l.*, instead of being paid to the Imperial exchequer, ought to be paid into the parish for parish purposes. If you can do that I am sure I shall be very much obliged to you. That is one of the things I strongly recommend. (*Mr. Osborne.*) There is one other point I would like to mention in connexion with the land tax; that is as regards the collection, and the dealing with the surplus. I think it would be a much better system if the collectors could be paid a certain poundage, which should be uniform throughout England, and that any surplus arising should be carried forward the same as you would do in the case of a poor rate for the union. There was a case cropped up in my own parish, in which there was only 16*l.* to be collected; a fresh collector was appointed, and he made a new assessment, and he worked the surplus up to within a few shillings of 5*l.* (*Mr. Finney.*) Over and above the 16*l.* (*Mr. Osborne.*) Over and above the 16*l.*, which the Commissioners may allow him to pocket.

35,401. The usual thing is to increase the assessment by something like over 5*l.*?—Yes.

35,402. Is not the foundation for that that the remuneration for collection is so small that if it were not for this bonus the collector would not do the work?—I do not think that is so. There has been no difficulty as regards a collection there.

35,403. It is an indirect way of paying, is it not?—I do not like the system. Then there is another point which I think should be made very clear. In the case of land being redeemed the onus should not be thrown on the present owner or occupier to prove which land has been redeemed, but the Commissioners should be able to put their hand on a plan or on papers, and be able to state which land has been redeemed without throwing the onus on to the present owner.

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

35,404. Do you think they have the materials for it?—I think the Government should provide them, or if they have not got the materials they should go into the matter and not throw it on to the present owner. I might mention that case in point in my parish. Lord Scarsdale had redeemed 40*l.* of the tax and the collector when he made this new assessment, found that the land paid no tax whatever, and so he spread it out on the whole rental. I told my landlord and agent that I should not pay the increase, and they looked into it but it took them about 12 months before they could get at the redemptions and then it was found that 4,000*l.* had been paid for the redemption of the land tax and yet this man was spreading it all over again.

The Merchandise Marks Act.

35,405. (*Chairman.*) What other recommendations have you to make?—(*Mr. Finney.*) There is one little matter that will turn up on the Merchandise Marks Act. We feel in a milk-producing country that we are rather under a disadvantage with the separated milk. It has been pointed out that certain factories make butter. The milk is separated and sold principally in the large towns. What use is made of it I do not know; whether it is mixed with other milk I do not know, but we think in Derbyshire that something should be done by way of compelling the people who have this stuff on their premises to mark the vessels "separated milk." I brought this matter before the Leicestershire County Council, and they passed a resolution of this kind: "Your Committee were also of opinion"—that is the Weights and Measures Committee—"that all vessels containing skimmed or separated milk should be labelled as such in letters an inch long; that a standard for water in butter be fixed; and that margarine should either be sold in a separate shape or coloured differently to butter." We also arranged that the clerk should communicate that to all the clerks of the county councils in England and Wales, and ask them to adopt a similar resolution. We rather think that the greater part of the separated milk is being distributed throughout the large towns, and is not sold as separated milk, but is sold in another form—that it is mixed with other milk to the disadvantage of everybody except the dealer. We are anxious that this marking system should be adopted. Then the public would know if they were buying separated milk that it was separated milk, and if they liked to buy it that is their business. We do not want them to buy a mixed article when they think it is whole milk or new milk.

35,406. You do not wish to prohibit the sale?—Not at all. (*Mr. Osborne.*) No.

35,407. What more have you to say?—(*Mr. Finney.*) I do not know that there is anything else.

Ground game.

35,408. Has the Ground Game Act worked satisfactorily in your district?—Yes.

35,409. Practically have the farmers killed the rabbits on their own farms?—There is a system adopted pretty freely in Derbyshire, by which the tenant, as a rule, does not kill hares, but the landlord kills the hares, and the tenant kills the rabbits. I think that is pretty well adopted all over.

35,410. That is the general arrangement?—Yes. (*Mr. Osborne.*) The landlord undertakes to forego his right to the rabbits if we give him the hares.

35,411. The landlord gives up altogether his right to the rabbits?—Yes.

35,412. And the tenant gives up the hares to the landlord?—(*Mr. Finney.*) Yes.

35,413. As a rule, are the hares preserved there?—Yes. (*Mr. Osborne.*) But not to the extent they were.

35,414. Not so much as they were?—No, they are diminished. (*Mr. Finney.*) But you see hares will not do any damage.

Judicial rents.

35,415. You speak in your proof of your desire for a fair adjustment of rents; by that do you mean a desire for judicial rents?—No, I do not think so. I do not think our Committee thought that.

35,416. Has the question been discussed in your association?—Not very much discussed, but we had a

discussion on it the other day by a committee. We put this table in which touches on that in a good many places (*handing in table*). I am rather inclined to think myself that the farmer and the landlord are competent to make their own bargains.

35,417. Then there is no general wish in your association or your neighbourhood to have judicial rents?—None. (*Mr. Osborne.*) I do not think so for a minute.

State loans.

35,418. Do you think that it would be advisable that State loans should be granted?—(*Mr. Finney.*) We think that they might benefit agriculturists so long as the rate of interest was not too high.

35,419. Should the loans be to the landowner or to the farmer?—(*Mr. Osborne.*) I think the intention in giving that answer was that they should be made to the landlords.

35,420. The farmer being a yearly tenant would not have much security to give?—No. I think that is the idea. (*Mr. Finney.*) In Derbyshire the landlord, as a rule, does the whole of the permanent improvements.

35,421. And you think if money was lent to the landowner at a fair rate the landowner would be in a better position to effect improvements?—I think he might improve the property.

Improvements in drainage and buildings.

35,422. Is there much necessity for improvements in your district in the way of buildings or drainage?—There has been a great amount of buildings built, and a good deal of drainage done. I should think few counties have had more money spent upon them. (*Mr. Osborne.*) I may say there has been a good deal of money spent on the buildings, but still there is room for a lot more to be done.

35,423. Still a good deal has been done?—(*Mr. Finney.*) Yes, a good deal. (*Mr. Osborne.*) And the dairying interest there, of course, requires a good many buildings.

Rates.

35,424. As I understand, you think the school board rate should be assessed on the same principle as the sanitary rate?—(*Mr. Finney*). Yes, I do.

35,425. Are there school board rates in most of your rural districts?—No, not very many.

35,426. Not many?—I do not think there would be over ten.

Technical education.

35,427. Do you think something should be done in the way of technical education for farmers?—The county councils make use of the money they have given to them for that purpose; they vote a fair share of it in our district. I may say that Leicestershire, Nottinghamshire, and Derbyshire, and, I think, the Lindsey district of Lincolnshire, are starting a dairy school within three miles of where I reside, which is to be conducted by the county councils conjointly. I rather think that they can meet what is wanted as regards dairy schools.

Co-operation.

35,428. Do you think something may be done for the farmers in the direction of co-operation in the manufacture and distribution of their produce?—It is a very large question and a very difficult one to work; but we have always thought that if such means could be devised for the farmer to place his goods in the hands of the purchaser he would get a better price for them. I think my friend Mr. Osborne almost does that, because he is a farmer at Quarndon, and he has a shop in Derby, and he takes his farm produce to his shop in Derby, and puts it into the hands of the consumer.

35,429. Do you derive advantage from that?—(*Mr. Osborne.*) Yes. I have had a business there for five years. I may say that I have a very good business wife, and she manages the dairy business, and I look after the business at the other end. She drives backwards and forwards, a distance of three miles.

35,430. Which end do you look after?—I look after the producing, and go down to the town occasionally; my wife goes down every day.

35,431. Who looks after the shop?—We have about 11 employées there. I have a separator and all conveniences for dealing with the surplus milk.

35,432. Do you sell other milk than your own produce?—Yes, I buy from two or three dairies besides my own, and I milk about 50 cows.

35,433. I hope you have made it pay well?—Yes, it has answered very well; in fact, I have built a new place, which has cost me 1,000*l.*

35,434. Do you think that, following your example, the farmers in your district might do more in that direction by co-operating?—I think so. Some years ago—a matter of five or six years ago—the Dairy Association did draw up a scheme with a view to erecting a factory; the centre pitched on was close to the Derby station, with a view to dealing with the surplus milk, so that any farmer, at any time, if he could not sell his milk at a remunerative price, or if he had milk on hand, could send it there to be manufactured. But the farmers did not seem to take an interest in it, or to have any desire to take the shares up, and that matter dropped through. Since that time I have started and gone on with this business myself.

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

Butter and cheese factories.

35,435. Do you say there is a better opening for butter factories than for cheese factories?—I think they are better paying concerns than cheese factories solely; in fact, cheese factories solely I do not think pay the farmer because no man can produce milk to sell it at 4*d.* per gallon.

35,436. According to your evidence cheese producing is rather going out of the district then?—Yes.

35,437. The farmers' efforts, then, have mainly been directed to milk and butter?—I may mention that the factory-made cheese is a good deal of it made on the early ripening system. It is a class of cheese which a good deal competes with the best class of American cheese, and it is not like the old farmhouse cheese which you used to get, and which the longer you kept it, if it was well made and good, the better it got; the factory cheese has just a certain time when it wants to be cut and eaten or it goes strong.

Railway regulations.

35,438. Do you find the milk trade hampered by the regulations of the railway companies?—I consider the conditions under which milk is carried are somewhat unreasonable. I refer especially to the last two clauses in the conditions of the railway companies—Nos. 10 and 11. A short time ago one of our members consigned some milk from Clifton, near Ashbourne. He consigned three cans of milk; of those three cans only two were delivered. With respect to the other one the company proved that they delivered it at St. Pancras, or supposed that it did get there, but it never was delivered to the purchaser. We had a great many complaints from our members about milk that was lost in transit or sent to its wrong destination, and what not; and we entered this as a test case, but we lost the case, and yet the company, although they do not undertake to deliver, still charge the carriage.

35,439. Are you aware that in cases of complaints of this kind against the railway company you have a right to appeal to the Board of Trade, and that the Board of Trade on receiving complaints of this kind can mediate between the company and the trader?—No, I was not aware of that.

35,440. Perhaps it might be as well if you were to inquire as to your rights under that clause?—(*Mr. Finney*). Yes. (*Mr. Osborne.*) I might mention also the delay in transit or in sending to the wrong station or not arriving in time——

35,441. All these matters of complaint can now be dealt with by the trader complaining to the Board of Trade, and the Board of Trade will then communicate with the railway company under what is called the mediation clause—that is the conciliation clause of the Act of 1888—and the Board of Trade will endeavour to bring the two parties together. You should try what the effect of that clause is?—(*Mr. Finney.*) Yes, we will do so.

The Derbyshire Dairy Farmers' Association.

35,442. (*Sir Nigel Kingscote.*) One of you, I see, is chairman, and the other is secretary of the Derbyshire Farmers' Association?—(*Mr. Osborne.*) The objects of the association are to promote the interests of members, to facilitate the carriage of milk, and the return of empty cans, to take action in the case of anything that is illegal, or in a case of breach of contract on the part of a customer or anything of that kind, and to protect the interests of the members generally.

35,443. To take up a matter such as you have just told us of as regards that action against the railway company?—Yes; we did take that up.

35,444. As an association?—Yes; as a test case, and we lost it.

35,445. You have no co-operative factory, or anything of that sort?—No.

35,446. Do you meet often?—There are no stated times for the committee to meet, but they meet, perhaps, 15 times in the year.

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

35,447. The committee?—The committee. And then there is the annual meeting, a general meeting, or if there was any special question to be discussed we might call a general meeting at any time.

35,448. But you do not have papers read and discuss subjects, do you?—We might in case of any particular questions being brought forward, but we do not, as a rule, discuss questions similarly to the Central Chamber of Agriculture.

Stock-keeping.

35,449. Do you breed your own cattle, or do you buy in?—(*Mr. Finney.*) I do both.

35,450. And you?—(*Mr. Osborne.*) Yes; I rear about 20 every year, but I find a great difficulty in getting the cows to come again at the proper time. Suppose I had one calf in the autumn, if that cow would not come to calf in the autumn again she would really be useless to me, and I should have to sell her off—to get her off fat.

35,451. Therefore the bulk of your animals are bought in and sold out?—We breed about 20 every year, and I also purchase to make up what I am short for the milk supply.

Cattle diseases.

35,452. Have either of you gentlemen suffered in your neighbourhood from cattle diseases?—We have had the foot-and-mouth disease once in 17 years. (*Mr. Finney.*) So have I on my farm.

35,453. Do you approve of the restrictions for stamping it out which have been in force?—Yes. (*Mr. Osborne.*) Yes; I do too.

35,454. You do not wish to see them relaxed?—No. One of the members of our council, Alderman Waite, mentioned to us the swine fever regulations. He thought they were rather irksome, and he thought the farmers would sooner be without the restrictions than with them. For myself I may say that I have not suffered much inconvenience. (*Mr. Finney.*) I have suffered none.

35,455. (*Mr. Little.*) From the restrictions, you mean?—Yes.

35,456. I thought you said you would rather be without the restrictions than with them?—(*Mr. Osborne.*) Mr. Waite was expressing the view of a great many farmers in his district to that effect. (*Mr. Finney.*) I think that may arise in this way: The town of Derby is within five miles of the boundary of the county, and so within a few miles you get Leicestershire, Nottinghamshire, Staffordshire, and Derbyshire, which have all regulations of their own, and in the borough of Derby there is another set of regulations which is rather conflicting. I think that was Mr. Waite's meaning. (*Mr. Osborne.*) With regard to the swine fever regulations there is just one point I should like to mention. I think it would be much better if the committees in the different boroughs of the county, and the county committee would all meet together and form one set of regulations instead of having two or more. (*Mr. Finney.*) So that the regulations should be uniform for the district.

35,457. (*Sir Nigel Kingscote.*) You want the regulations in the whole area to be uniform, and not different in the different localities?—(*Mr. Osborne.*) I think it would be much better if the committees were all to meet jointly and fix one set of regulations for the boroughs and the county.

35,458. (*Mr. Lambert.*) Is that not so now? Under the new swine fever regulations are not the Board of Agriculture taking steps to secure uniformity as regards the regulations?—I am not aware of it. I know that the borough have had their committee, and issued their own regulations independently of the county.

35,459. (*Sir Nigel Kingscote.*) You say you have got a shop where you sell your produce; how far does your produce have to come?—Three miles.

35,460. And does most of the other produce that passes through your shop come about the same distance?—Yes. I can sell, as you may say, pretty well any produce that I might have. We go in for confectionery, too, very strongly, and that is all made on the premises, and we have a refreshment department as well.

35,461. Three miles on a flat road, I suppose?—Yes, it is a good road.

Butter and cheese factories.

35,462. (*Mr. Little.*) I think you said that butter produced at factories or creameries commands a higher price than the farmers' butter?—Yes.

35,463. But that the contrary is the case with regard to cheese, namely, the cheese produced at factories fetches a lower price?—That is speaking of the real good farmhouse cheese. There is a demand now for real good farmhouse cheese, and if you can get it, or if a factory could get it, you could make a really good price for it.

35,464. But the factories do not make that character of cheese?—No.

35,465. What they make comes in competition with the foreign cheese?—With the first American.

Restrictions.

35,466. Mr. Finney, in his brief, suggests that no restrictions should be imposed as to the method of the cultivation of land. Do you propose that the law should deal with that, or simply that common sense should prevail?—(*Mr. Finney.*) I think common sense should prevail.

35,467. You do not want the law to interfere between the landlord and tenant, and say, "You shall not make "a bargain to devote the land to this particular pur-"pose"?—No, I do not say that I do.

The Merchandise Marks Act.

35,468. With regard to the separated milk and other produce, you only want if it is sold, that it should be sold under its true name?—Yes, we are very anxious about that. (*Mr. Osborne.*) I think that is quite as necessary as the Margarine Act. I may say that the separated milk when consigned and sent up to London or other large towns comes on to the platform, and no one has any knowledge whatever what it is except the man to whom it is consigned, and he can mix it and blend it, and no one would be any the wiser; whereas if it were placarded you would naturally know the one was new milk and the other separated milk.

35,469. Would it not betray itself if it were analysed?—(*Mr. Finney.*) No; there is the difficulty. (*Mr. Osborne.*) Not to the full extent.

35,470. It would only show that there was a very low quantity of cream?—(*Mr. Finney.*) Of fat.

35,471. Of fat?—Yes, and no water. (*Mr. Osborne.*) If that man can buy a dairy which is rich in cream, then he can do as I know has been done; he can put three gallons of separated milk to a churn of new milk, and then he can pass the inspector with impunity. If you get a rich dairy milk then you get a high percentage of cream, and the separated milk does not bring the total solids down much; it only reduces the fat.

Milking.

35,472. (*Mr. Gilmour.*) Is the milking down in your part of the country done by women or by men?—(*Mr. Finney.*) Almost wholly by the men employed on the farm.

35,473. Then they do this duty before going out to work on the arable land?—Yes.

35,474. As ploughmen?—The ploughmen as a rule do not milk unless on a farm where there is a very small quantity of arable land.

35,475. How many cows do you allow to a man to take the whole year round?—I should say about six. (*Mr. Osborne.*) We generally reckon eight.

Ground game.

35,476. In reference to the Ground Game Act you say it has worked well; the tenants are allowed to kill their rabbits, and the other ground game is left to the landlord. Are the tenants in your part of the country allowed to go into the coverts and trap there?—(*Mr. Finney.*) No, I think not. (*Mr. Osborne.*) No.

35,477. How do they keep down the head of rabbits, are they allowed to snare in the fields?—I know one instance such as you have mentioned, where the landlord has found some wire to be placed at the side.

35,478. To wire in the covert?—To wire on the outside of the covert. (*Mr. Finney.*) In my own case after the passing of the Ground Game Act my landlord gave me the game on the farm, it was not worth very much to let then, I suppose.

35,479. About that right of trapping in the coverts, I understand there is no complaint as to the working of the Ground Game Act; the tenants are able to keep the rabbits down to such an extent as not to have any question raised about it?—Yes, I think so. I have not heard of any complaint; I think it is working satisfactorily.

Rates.

35,480. (*Mr. Dalton.*) What would be the effect in your parish if land was rated at a fourth of the school board rate? What is your present school board rate?—Sixpence.

Mr. R. Finney and Mr. S. Osborne.
22 Nov. 1894.

35,481. For the year?—Yes.

35,482. Have you got much building?—No, no manufactories, the buildings would be the farm houses and cottages; in fact, the area of the school district is in two parishes, Hemington and Lockington, but they are identical as regards their conditions, for there are no manufactories, and the buildings are principally houses.

35,483. Are there many houses; is there a town there?—No.

35,484. Only a village?—A few more houses than are required for the working of the land which are occupied by men employed at a brewery and on the railway, and things of that sort, but not a great number.

35,485. Then it would not make much difference in your parish if the land was rated at a fourth of the school board rate?—Yes, it would relieve the agricultural land.

35,486. But you would have to pay a much higher rate. You would have to pay the bulk of it, the bulk of the property in your parish being agricultural land?—Yes.

35,487. You would only throw a little more on the houses?—You would throw a good deal more on the houses.

35,488. But in other parishes where there are more houses?—If there are more manufactories, shops, and that sort of thing, it would affect it materially.

35,489. I did not quite understand how you brought up your rates to 2*s.* 6*d.* in the pound: there is the 6*d.* for the school board rate, there is the 1*s.* for the poor rate, including the county rate, 6*d.*, I think, you say it is this half-year?—Yes.

35,490. That makes it 1*s.* 6*d.*; where does the other rate come in? Is there a highway rate, or is that paid out of the poor rate?—No, that is separate; we have a highway board.

35,491. About how much in the £ is that?—I think it is 8*d.* I know I signed the rate the other day as churchwarden at 1*s.* 4*d.* in the £, and I signed the previously half year at 1*s.* 2*d.*, and I have paid the 1*s.* 2*d.* But there are some few expenses in parishes, and I think our collector may possibly be looking ahead a bit; he may have been anticipating the parish council, thinking they may require a little money—I will not say he has not—perhaps he thought they might require 1*d.* of it for the current half year.

35,492. Has there been much building going on in your union of late years?—Yes.

35,493. A great deal?—Yes, it has increased very much indeed.

35,494. Any new railway, or anything of that kind?—Not much new railway, but there is a deal of railway in the union.

35,495. The railway and the buildings, I suppose, help the poor rate very much?—Yes, very much. But I may say that, although the rent of agricultural land has been going down for some time, there has been a steady increase in the rateable value of the union.

35,496. And a very large increase in the rateable value of your county?—Yes.

35,497. (*Chairman.*) Do you know what the actual figures are in your union, because they are very curious. I have got here the rateable value of the land, houses, and railways for your union, compared with the year 1871. It seems that the assessment on the land has been reduced from 137,000*l.* to 118,000*l.*; the assessment on buildings has been increased from 45,000*l.* to 111,000*l.*; and the assessment on railways from 23,000*l.* to 77,000*l.*?—I think it has got higher still.

35,498. The result is, that whereas land, 20 years ago, paid two-thirds of the whole rates, it now pays only one-third?—Yes, that is so. The rateable value of the union at the present moment is 321,000*l.*

35,499. I should think your union has gained more in the 20 years than any other union in the country almost, in respect of railways?—I think it has. There was rather a disposition after the Boundaries Commission, to sever the parish, and some other parishes in Leicestershire, from that union. I was very anxious to remain in that union, as you can understand, and we satisfied the Commissioners that it was a proper thing to do.

35,500. I was striving to appreciate the extent of your grievance?—(*Mr. Osborne.*) In the Belper Union the rates are much higher: they run from 8*d.* to 10*d.* in the pound for the half year.

35,501. What is your union?—Belper. (*Mr. Finney.*) We have a great amount of railway.

35,502. I imagine there is no other union in the country so favoured. Belper is not bad. The assessment of land has been reduced in the 20 years from 104,000*l.* to 83,000*l.*; the assessment on buildings has been increased from 55,000*l.* to 84,000*l.*, and the assessment on railways has been increased from 14,000*l.* to 47,000*l.*, and whereas land paid half the rates 20 years ago, it now pays about a third?—In the Belper Union?

35,503. In Belper. It has not benefited quite so much as Shardlow?—No. I think Shardlow is a favoured union.

35,504. (*Mr. Dalton.*) I see from your brief that you reckon the rural depopulation as being from 5 to 10 per cent.?—Yes.

35,505. What years do you take that from; since when has that reduction taken place?—I think it was during the last 20 years.

35,506. I understand you reckon that the condition of the labourers has only improved 20 per cent I do not quite make that out. From your figures I think there has been a larger increase than that even in the wages, without taking into account the lowness of prices. You said the wages had increased from 13*s.* to 18*s.*?—Yes, that is 5*s.*

35,507. That is more than 20 per cent. by itself?—Yes.

35,508. Then if you add to that the other benefits that have arisen, it would come to very much more?—Yes, but I did not want to overstate the case—that was really my reason.

Butter factories.

35,509. (*Mr. Lambert.*) Upon the question of the butter factories; the butter produced in factories being worth 3*d.* per pound more, or selling at 3*d.* per pound more than the ordinary butter, why do not farmers generally use the factory?—(*Mr. Osborne.*) Because a great many of the factories are held by companies, not by farmers; they are not farmers' co-operative factories.

35,510. But why do they not take the matter into their own hands, and establish a co-operative factory?—I mentioned a factory that had been done so, the Eggington factory; for some years they lost money considerably, but now they have pulled themselves together, and it is doing better. I think there has been a great laxity, I may say, on the part of farmers, in not co-operating. But still, in the case of butter factories, the question of paying all rests upon the sale of the separated milk. I myself have made butter, and I am quite sure that if you cannot dispose of the separated milk profitably, then it leaves a loss rather than a profit.

Separated milk.

35,511. How do you dispose of your separated milk?—I sell some of it to men who retail it, and any surplus that I have goes home for the rearing of calves and the feeding of pigs. I have a farm, and I can make the best of anything I cannot sell.

35,512. Do you find that separated milk is a good thing for calves?—Yes, we have been very successful with the rearing, and also the pig feeding. I find that it takes very little corn in conjunction with the separated milk.

Fall in prices.

35,513. How much do you consider that agricultural produce in your district has depreciated in price per cent.?—Speaking of milk I should say from 15 to 20 per cent., about 25 per cent. on meat, and on corn quite 50 per cent.

Rent and labour.

35,514. Have your rents depreciated from 10 to 33 per cent.?—Yes, that is taking the basis of the returns.

35,515. And yet the labour bill is quite as much as it used to be?—Yes. (*Mr. Finney.*) More. (*Mr. Osborne.*) It is more than it was 25 or 30 years ago.

Rent and prices.

35,516. How is it that the rents have not depreciated to the same extent that agricultural produce has depreciated?—They do not all work down to a level at once. The farmer keeps struggling on hoping for better times. I consider that if a tenant were to go to his landlord, and pull everything down to the extremity now, he might naturally expect, if times mended, that the landlord would say, "It is now my turn, we will "put your rent up in accordance with the times again."

35,517. But the rents have not yet gone down according to the times?—Perhaps not, proportionately.

Farmers' capital.

35,518. You say that the farmers have insufficient capital; is that owing to their having paid too much rent?—I should say it is because their capital has decreased through losses in having to pay their rents, and other payments.

35,519. If they had not paid so much rent they would have had more capital with which to farm their land properly, or better?—Naturally they would have had more left after paying expenses.

35,520. Do you calculate that farmers are now getting a sufficient return for their capital?—I do not.

35,521. If they paid less rent, I suppose they would get a better return?—Naturally it would make some difference.

Reduction of rent.

35,522. Is it not the case a good deal as regards tenant farmers that this is a question of rent?—I think the rent is not the only thing. You see, if a landlord takes 10 per cent. or 20 per cent. off it amounts to a very small item in comparison with the decrease in the price of produce.

35,523. It does amount to a very small item, and, therefore, it ought to be more?—We should really want the farms for nothing in some cases, if we must put it in proportion to the price of decrease in the price of produce, and in accordance with that. You may say that I had 50 quarters of wheat to sell, and it is worth 1*l.* a quarter, but if it had been worth 3*l.* it would have fetched 150*l.*

35,524. There is the fact that rents have not gone down, and you ought to have the farms at very much less rent in order that tenant farmers, and I am speaking alone of tenant farmers, might pay their way?—There is no question that unless things are very different it will come to that; it must be so.

35,525. What prospect do you see of things becoming different?—The prospects are very gloomy, certainly.

35,526. (*Mr. Channing.*) Do you think it desirable to wait for the turn of the tide in order to get reductions of rent?—I had one reduction of 10 per cent., and then I had a second, which makes 20, and he is giving a further 5 per cent. at the present time—that makes 25.

Dairy buildings in Derbyshire.

35,527. I should like to ask you about the dairy buildings in Derbyshire; are the farmers generally satisfied with the dairy equipments they have on farms?—No.

35,528. What do they want?—In many cases the cow sheds and the dairy itself are in a very bad state. I might mention, perhaps, that on a neighbouring estate to Mr. Finney's—that is, Mr. Curzon's at Lockington—you will find some of the best buildings, that is dairies and farm-houses, that you will find almost anywhere.

35,529. On many farms are the equipments obsolete and not good enough for working dairy farming in the best way?—In many cases they are not good enough; in fact, if mine were more modern and put into a proper form it would almost take one man less to do my stock.

35,530. Are you able now on application to the landowner or agent—I do not mean in your own case, but I am referring to farmers generally—to get new buildings and new arrangements?—No, we find there are very few new buildings; it is simply a matter of repairs done now chiefly. The landlord appears to endeavour to keep down his expenditure naturally with the lesser rents.

35,531. Do you know of any dairy farm tenants who have offered to put up buildings of their own?—No, I do not.

Butter making and milk selling.

35,532. Now about the uniformity of the butter supply; does your association make any arrangements which would enable the members to send butter of a uniform quality to London, or do you not interfere with the arrangements of each farm?—There has been nothing done except what I have mentioned as regards the co-operative factory, which was more to deal with surplus milk. It is not generally considered that butter making is any better than milk selling if they could sell the milk at a fair price. They would sooner sell milk than make butter.

35,533. It would be a great advantage to dairy farmers, would it not?—They would get more command of the market if an association like yours were in a position to guarantee uniformity of quantity and quality, would they not?—Yes, I have no doubt they would be able to obtain a better price.

35,534. Is not your association aiming in that direction?—We have not done anything since the time that I referred to, because it is chiefly milk selling now, and if we can get a remunerative price for the milk we would sooner sell it than start a butter factory.

35,535. Are you aware that the Danish arrangements are so perfect that dealers in London can telegraph to Copenhagen and rely on a supply of absolute uniformity in quality and quantity being put on board ship the next day?—Yes, I have read that.

35,536. Do you not think that similar arrangements in England would be of very great value to dairy farming?—Yes; I have no doubt they would be beneficial; still I should not recommend butter making pure and simple, I think.

35,537. Do you think the future of dairy farming is more confined to milk and cheese?—I think the farmer should rely on the sale of milk, but there should be a factory whereby he could keep the milk off the market when it is not wanted. Instead of forcing the milk on to the market and reducing the price, I would have a factory to deal with the surplus milk.

35,538. Do you not think you can get a partial command, at any rate, of the London market again, if you organised butter making?—Yes, I have no doubt it could be done.

Restrictions.

35,539. I have been looking at Mr. Finney's notes with reference to the restrictions on the cultivation of land. What are the restrictions on the cultivation of land?—(*Mr. Finney.*) There are restrictions; but, as a rule, the restrictions are pretty much in this way; that the tenant is expected to consume on the holding the hay, straw, root crops, and that sort of thing, and the owners have not been at all averse to allowing tenants to sell off a fair proportion on their asking permission to do that.

35,540. And you think it would be desirable if that practice were extended?—I think so, especially at a season like the last when produce was very dear.

Condition of farmers.

35,541. (*Mr. Everett.*) I notice that in sub-head (2) in the first page of your notes you say, "Where the tenant "has ability and sufficiency of capital, he has not "suffered more than other classes"?—In Derbyshire.

35,542. Am I to understand from that that the people generally in your neighbourhood have been suffering of recent years?—The enquiry we made was under three heads; and I think it comes under "tenants, large, medium, and small," does it not? We did not think large farmers suffered more than the other farmers who had not sufficient capital.

35,543. I thought you were referring to traders and people generally?—No, not at all.

35,544. I understand that the fall which has taken place in prices while it has a good side for you in regard to the corn and the food you buy, has on the whole hurt you more than it has benefited you?—Materially so.

35,545. (*Chairman.*) Individually; but I thought you said many of the farmers buy more than they sell although you yourself sell more than you buy?—I sell more than I buy. A man having a farm of say 50 to 100 acres wholly grass, or perhaps only five or six acres arable, would benefit, because he would have nothing to sell in the shape of corn, and he would buy meals for his stock at less than he would have done some time since, so he has benefited.

35,546. (*Mr. Everett.*) He would benefit in the bought food that he purchased, but I thought I understood you that the fall in the price of what he had to sell would still put him in a worse place then he was, say, ten years ago?—No doubt about that, he is in a worse place than before. Although he has bought his corn for less, he has sold his fat stock and such like at so much less in proportion, that he has been at a disadvantage.

35,547. The condition of the grass farmer has gone back as well as the condition of the arable farmer on the whole?—Yes.

Cost of labour.

35,548. Could you kindly tell me about what is the cost of labour per acre on your farm now; if the farm were half grass and half arable, what would you average per acre, do you think?—I think it is nearly 1*l.* an acre on the whole of the farm; it is two-thirds grass and one-third arable.

35,549. You spoke of a good deal of land being laid down to grass; I suppose that the probable reason of that is that the land cannot carry the labour bill and a rent too?—Yes, that is so; it is done to lessen the working expenses.

35,550. Production had become unprofitable upon it as arable land?—Yes.

Condition of labourers.

35,551. Regarding the condition of the agricultural labourer generally, do you think that if agriculture had continued prosperous instead of going back, his condition would have improved correspondingly?—I think so.

35,552. Do you think he would be quite as likely to improve his condition with our industry prosperous as with it declining?—I think so, because he would have commanded more wages.

Prices and wages.

35,553. It would have taken the shape of higher wages for him?—Yes, and there would have been more labour. As I have pointed out, I remember the time when we used to look round the farm to find out what work it would be a good thing to get done; now it is almost the reverse, and you have to look after things that you can leave undone for a time.

35,554. If things had continued well with farmers as they were 20 years ago you would have had more labour?—Yes.

35,555. And higher wages?—Yes.

35,556. (*Chairman.*) But the labourer would have had to pay more for his food if prices had remained as they were?—Yes, he would have paid more for his food.

35,557. (*Mr. Everett.*) Do you not think the labourer prefers to see his money wages go up rather than keep stationary, and what he has to pay for go down?—He wants to keep the wages up, and he would rather see them get a little higher. There is quite a feeling against reducing wages.

35,558. His contentment would be greater probably with rising wages and stationary prices of commodities than it is with stationary wages and falling prices of commodities?—I think it would be so.

Tenure.

35,559. Why are annual hires of land in your district preferred to leases?—That has been the system; we have never had a system of leases.

35,560. Not even in the good times?—Not even in the good times. I cannot at the present moment think of a farm that was held under a lease. There is one isolated farm, and it has been a great disadvantage to the tenant.

Foreign competition.

35,561. I notice that you attribute the fall in prices to foreign competition. Has your attention been called to the fact that for the first 30 years after free trade prices rose instead of falling?—Yes.

35,562. You are aware that that is so?—That is so.

35,563. During those 30 years foreign competition did not drive prices down; would that not almost look as if some other cause had been acting upon prices besides foreign competition in recent years?—I do not know. The other day I was selling wheat. I was offered 1*l.* a quarter for this wheat, and the miller who was looking at it said: I would rather buy this foreign stuff. He showed me some thin stuff which he said was very much better than mine at the same price. He said I can buy this, therefore I cannot give you more. So I quite thought, in the case of wheat particularly, that it was foreign competition.

Prices and wages.

35,564. (*Chairman.*) With regard to the labourers, you have told us that their wages have risen from 13*s.* or 14*s.* a week to 18*s.* during the last 20 or 25 years, and that they have also benefited very largely from the low prices?—Yes.

35,565. Then Mr. Everett has asked you whether the wages would not have increased even more if prices had been maintained?—I think it is very likely.

35,566. At all events they would not have benefited—— ?—There would have been no benefit to the labourer, because he would have had to pay more for his commodities.

Assessment to rates.

35,567. I see from the returns of the assessments of the present day compared with 1869–70 that in your union the assessment has been reduced about 15 per cent. on land?—Yes.

35,568. There are some other unions in Leicestershire where there has been no decrease. For instance, in the Union of Melton Mowbray the assessment on land 20 years ago was 125,000*l.*, and is now 123,000*l.*, which is merely a nominal decrease. What is the reason of that? Is the land superior there?—I should think there is as much depreciation in value there; but of course, as you know, each union committee has its own way of assessment, and each union differs from the others.

35,569. As a general rule they follow the reductions of rent, do they not?—As a rule they do; in our union the rental is the basis.

35,570. Therefore we may assume, unless there is some other explanation, that the rents in Melton Mowbray Union have not been reduced?—In some unions the rental is not taken as the basis at the present time; I do not know whether that is one of them.

35,571. It is very rarely the case?—In our union the rental is the basis.

35,572. I think we may take it as a general rule that rental is the basis?—It is the safest basis.

35,573. Do you know any reason why, in Melton Mowbray, the rents should not have fallen?—I do not.

35,574. Do you know the land there?—Yes. (*Mr. Osborne.*) It is very nice land. (*Mr. Finney.*) It is in the hunting district of Quorn.

35,575. It is a purely grass district, is it not?—Principally. A good deal of the arable land is heavy land; and I should think the rents have been reduced as much there as with us. I do not understand why it should be otherwise.

35,576. Do you know the Union of Ashby?—Yes.

35,577. What kind of land is that; is that a grass district?—Yes.

35,578. Mainly a grass district?—Grass and arable; pretty much the same as with us.

35,579. Apparently there the assessment has been maintained?—On land?

35,580. Yes?—I do not know how that is; I know rents have gone down in that union.

Rent of grazing land.

35,581. (*Mr. Clay.*) What is the general price of grazing land in Derbyshire?—Do you mean the average of the district, or the best land?

35,582. The average?—About 30*s.*

35,583. What is it for arable land?—That would be less.

35,584. How much?—You might say 25*s.*, or even perhaps less than 25*s.* A good deal of the worst arable land at the present time is seeded down to grass. What I call the worst is the heaviest working land, which does not pay for cultivation.

Rates.

35,585. (*Mr. Dalton.*) I think you said that in your union the railways pay a fourth of the whole rates?—They do.

Derbyshire Dairy Farmers' Association.

35,586. (*Captain Owen Thomas.*) When was your association formed?—(*Mr. Osborne.*) It has been in existence about 13 or 14 years.

35,587. Has it been a great success?—Yes.

35,588. Have you a copy of the rules?—I have not. I should be pleased to send you one, and the annual report if you would like for me to do so.

35,589. Will you please do so?—Yes. I may say that when I commenced to be secretary, which was about 11 years ago, it only numbered 41 members, and at the present time it has over 600.

35,590. (*Chairman.*) How near is your farm to the town where you sell your milk?—Three miles.

35,591. The rent there has been very little reduced I think you said?—About 20 per cent. mine has.

35,592. As much as 20 per cent.?—Yes.

35,593. And you have not made a bad business of it in connexion with your business in the town?—It has answered my purpose. My landlord was rather afraid that I might neglect the farm when I got into business.

35,594. (*Captain Owen Thomas.*) Is dairy-farming on the increase in your district?—I think perhaps dairy-farming has got to its full extent. There is an inclination to decrease the dairying rather than to increase it. (*Mr. Finney.*) Derbyshire has always been, in my time, a dairy district, and there has not been much cattle grazed.

Value of land.

35,595. (*Mr. Everett.*) Your best lands in the good times fetched considerably over 100*l.* an acre for the freehold, did they not?—Yes.

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

35,596. You must have some very good grass?—We have some good grass.

35,597. I had to do with a farm in the Ashbourne district that changed hands at 140*l.* an acre?—There is some land that was bought in 1869 at 112*l.* I do not know what it would be worth now, but it would be very much less than that. I should like to put in this large table if you will not publish the names of the individuals. We sent out a circular asking for these replies, but we promised that the names should be kept private (*handing in tabulated return of the* 155 *replies to the circular issued to the members of the Derbyshire Dairy Farmers' Association*). (*Mr. Osborne.*) There is just one point as regards the conditions of the carriage of milk which I did not mention, but which I intended to touch on. The railway companies insist on the carriage being prepaid. In the case of a farmer or respectable man they will give him a monthly account, but still they can demand the prepayment. I think that milk is perhaps almost the only article that you cannot consign by railway "carriage forward."

Railway regulations.

35,598. (*Chairman.*) I have to make the same remark about that as I did with regard to the other points; that you should address your complaint to the Board of Trade?—Thank you; but I thought I would like to bring that matter before you.

Mr. R. Finney and Mr. S. Osborne.

22 Nov. 1894.

35,599. (*Mr. Channing.*) I would like to know whether, in your parts of Derbyshire the railway rates for milk have been reduced materially, and to the satisfaction of the farmers since the rise in 1893?—They have been brought down to the old rates, which we do not consider excessive.

Railway rates.

35,600. They have been generally brought down?—As regards Derby especially; but as regards North Staffordshire alone, they have increased the rate by making it imperative to consign the milk by imperial measure. Adding that penny per churn makes an increase in the rate for carriage of 6 per cent.

35,601. By the alteration of the quantity?—By the addition of that one penny per churn.

35,602. And you cannot get a remedy for that?—No.

The witness withdrew.

Mr. G. Brown.

Mr. George Brown called and examined.

Mr. G. Brown.

35,603. (*Chairman.*) You are a farmer residing at Ampthill, Bedfordshire?—Near there, at Marston.

Witness' farm.

35,604. How much do you farm?—The acreage is 472, at a rental of 628*l.*

35,605. Do you hold under the Duke of Bedford?—Yes.

35,606. How long have you held the farm?—I have farmed on my own account since 1875, but I was managing for my father since 1868.

35,607. The same farm?—No, in the same parish, but a different farm.

Reduction of rent.

35,608. Has there been much reduction of rent?—The farm that I first took, called Beancroft, consisted of 328 acres. That stood me in a rent of about 35*s.* per acre—250 acres at 35*s.* and 70 acres at 40*s.* It belonged to the Duke of Bedford at the time I took it; after that the Duke sold, and the gentleman who bought it I suppose got into difficulties; he was a small landowner, and the mortgagees took possession. I tried to come to terms with them, but could not do so. A farm fell out under the Duke, and they offered me it, and I took it. That farm which I had paid 35*s.* and 40*s.* an acre for was let directly at 25*s.* per acre. The farm I now occupy under the Duke consists really of two lots. 428 acres is the farm proper, and then there is a matter of 50 acres for which I pay 2*l.* an acre. I pay for the 428 acres 520*l.*; and for the 50 or 52 acres, I believe it is, I pay 104*l.* Since giving his evidence the witness received the following communication, which he requested might be appended to his evidence:—

Copy of Letter to George E. Brown, Marston, Ampthill, Beds., from Mr. Hall, steward to His Grace the Duke of Bedford.

Sir, Woburn, November 22, 1894.

I am directed by His Grace the Duke of Bedford to inform you that in addition to the continuing half-yearly remissions of 25 per cent., promised by the late Duke of Bedford until Lady Day 1895, His Grace will make a further remission of 25 per cent. from your half-year's rents due respectively at Michaelmas 1894 and Lady Day 1895, upon payment by you of the balance, at the times appointed for the audits, and otherwise subject to the conditions of your lease.

I am further to inform you that His Grace has decided upon a re-adjustment of your rent, and has directed that a re-valuation of your holding shall be made during the spring and autumn of the ensuing year. &c. &c.

Average rent.

35,609. Is 1*l.* an acre about the average rent in that district?—It varies very much indeed. We have a lot of heavy clay land in the locality which has gone wonderfully down in rent.

35,610. (*Mr. Channing.*) What is your own land?—My own is practically all clay.

35,611. (*Chairman.*) But the better land, what would that let at?—I pay up to 40*s.* There is some clay land let as low as 7*s.* in the same village. We have some of the best grass land in the locality, and we have some of the worst in the locality. But I may say in reference to this rent that I pay that the land is under the Duke of Bedford, and he has from time to time made remissions. I think the average of the remissions would run to about one-third.

35,612. One third of the rent?—Yes.

35,613. Spread over what length of time?—I take the average for the last five or six years.

35,614. Taking the average of five or six years he has remitted about one-third?—I think so, but I will not be quite sure.

35,615. Has he made no permanent reductions?—The Duke of Bedford has not.

35,616. I suppose, compared with 15 or 20 years ago, he has made permanent reductions?—On some farms, but not on others. I believe on the fresh takes there may perhaps have been reductions, but on the old takes I should very much doubt whether there have been any reductions.

35,617. (*Mr. Little.*) The Duke's rent includes all tithe and land tax, does it not?—Yes, exactly so.

35,618. (*Chairman.*) I suppose you may consider then that some little time ago it was a low rent?—When I took this farm that I now have, seven years ago, there was a reduction made on that of 100*l.*

Assessment to rates.

35,619. On what value are you assessed for your rates?—I am assessed at 18*s.* an acre.

35,620. That is rather less than you pay?—It is less than the gross rent, but it is not on the real rent, taking into consideration the remissions.

35,621. Then that has been taken into account by the assessment committee?—No; unfortunately our assessment committee will not take rent as a basis. For my own part I have argued it many a time before the assessment committee as a member of that committee, but I never could get them to see as I saw. They go upon the wording of the Act.

35,622. Apparently they have assessed you at somewhat less than your actual rent, but they do not take into account the fact that on the average of years you have had a remission of one-third?—That is so.

35,623. That would seem rather to involve the proposition that it would be wiser on the part of the Duke of Bedford in the interests of his tenants to make a permanent reduction of the rent?—It would be much more satisfactory.

35,624. (*Mr. Little.*) If there were tithe upon this land you could not be assessed upon that; you would be entitled to deduct that from the rental for the assessment?—I ought to have mentioned that fact when the Chairman was speaking to me. There is a very heavy tithe in our parish; it would average over 4*s.* an acre taking the parish through.

35,625. (*Chairman.*) That of course ought to be deducted in making the assessment?—That is done.

35,626. The landowner pays the tithe and your rent includes it really?—The rector pays rates on the tithe, and that is deducted.

35,627. So that it ought to be deducted from your rent in assessing the land?—Yes, if so be rent was taken as the basis.

35,628. Apparently, if that be so, your rent averages about 1*l.* an acre, and the assessment is 18*s.* an acre, and the tithe is 4*s.*, so you are assessed somewhat above the rent; is that so?—Yes, somewhat above the gross rent.

Mr. G. Brown. 22 Nov. 1894.

35,629. Without taking into consideration the reduction of one-third which the Duke has made?—There are many instances where perhaps it would not be quite fair to assess land on the rental. In some instances you will find small pieces of land rented on one side of the hedge at a fancy rent; but on the other side you would find a large farm that would not be rented at 1*l.* an acre. That is where the difficulty comes in of rating all land by the rental.

35,630. At all events in your case you say inasmuch as the landlord has made these large remissions they ought to be taken into account in the assessment?—Yes; I may say that there has been a reduction throughout our Ampthill Union. It is gradually working itself off. I should have been on the assessment committee to-day. There has been a reduction of about 5*s.* per acre from the basis of 1882. In 1882 there was a revaluation throughout the Union.

35,631. Was there a reduction then?—Yes, I was not on the assessment committee, so I cannot speak to it exactly.

35,632. (*Mr. Little.*) Can you tell us whether that assessment was made by a professional man or by the committee themselves?—By the committee themselves.

35,633. (*Chairman.*) Since then there has been a reduction in the assessment of 5*s.* an acre?—Yes, of course there were continual appeals before us, and some were reduced, but in starting on this new basis we went back to the 1882 figure. If they had been reduced since then they did not get so much as the 5*s.* but we went back to the old 1882 basis.

35,634. You say "we"; you are on the assessment committee yourself?—Yes.

35,635. Have you pressed on your colleagues the expediency of taking into account these abatements of rent?—Yes, we have had that question very hotly debated before us.

35,636. But you have not succeeded in persuading them?—No.

35,637. Have you represented the case to the Duke of Bedford that it would be better to have a reduction of rent?—They could not help but read it in the local press; I think that has been brought to their notice.

Farms in hand.

35,638. Are there a large number of farms in the landowner's hands in your district?—Yes. In several parishes in North Bedfordshire especially, there is a very considerable quantity of land in the hands of the landlords, and where the farms are let they are let at very much reduced rents compared with what they used to be some 20 years ago. In my own parish there are several farms, more particularly one in Wroxhill. That was a farm that some years ago used to employ a considerable quantity of labour, perhaps eight or ten men besides boys. That farm was let to a Lincolnshire man at 29*s.* an acre with tithe upon it something like 5*s.* an acre, making 34*s.* altogether which he paid. His lease ran out four years ago; since then that farm was in hand some two or three years, and now it is let at 7*s.* an acre and there is quite 4*s.* an acre tithe upon it.

35,639. To whom does the farm belong?—It is in the hands of mortgagees, I believe.

35,640. (*Mr. Little.*) Do you mean that the 7*s.* includes the 4*s.*?—Yes.

35,641. Then it is a comparison between 3*s.* and 29*s.*?—Yes, that is it.

35,642. (*Chairman.*) Is there anything exceptional about that farm; was it in very bad condition when it was let?—It was in good condition when the Lincolnshire man left it, but it has tumbled down; most of it has been allowed to what we call tumble down into grass.

35,643. I suppose while it was in the hands of the mortgagees it fell back in condition and tumbled back into bad grass?—They allowed it to tumble down.

35,644. That accounts in some respects for the very low price at which it was let, as compared with other land?—It is the bad price of the produce which you grow.

35,645. I mean you have to take into account the condition which the farm was in?—Yes, perhaps a little.

Value of land.

35,646. Is that an illustration of the rent of all the farms around it?—No; we have some good land in the locality that has not sunk to anything like that proportion.

Mr. G. Brown. 22 Nov. 1894.

35,647. Is that exceptionally bad?—No; we have thousands of acres there that have gone back very materially in value. At Wood End there is a place; it had four or five good tenants within my recollection within the last 10 or 15 years—say 15 years. A gentleman bought it—the same man who bought my Beancroft farm; he thought he was going to farm it, and made the attempt, but he failed, and the mortgagees took possession and they have quite recently sold it.

35,648. What has it sold for?—I could not quite tell you. Mr. Gordon, an hotel proprietor, has really bought it. There is another farm adjoining me, and I happen to know a party who had 6,000*l.* mortgage on it. My father was trustee for that 6,000*l.* on that particular farm. Fortunately that was paid off some four or five years ago. This farm was put up in the market and was offered for sale a few days ago, and the highest bid for it was 2,500*l.*

35,649. How many acres?—There would be just under 200.

35,650. Was the tithe there about 4*s.* an acre?—That is not all in the parish of Marston, but that portion which is in the parish of Marston—there would not be more than 30 acres in the parish of Marston—is titheable at about 4*s.*

35,651. Do you know whether the land tax is heavy?—I do not know much of the land tax in our village, but I have heard a goodish deal of complaint about it. It is a tax that I have never gone into; it is one that has not affected me, and I have not gone into it.

Large and small landowners.

35,652. Have the large landowners in your district suffered less than the smaller ones?—I should say decidedly they have or appear to have done so; because with reference to the smaller ones they seem to have practically gone out altogether. A great many of the small landowners have so far had to retrench or have had to leave the district, that they are, I should say, in exceptionally bad circumstances.

Description of soil.

35,653. Is all this land arable land?—Principally so.

35,654. Is there not much grass with it?—No, there would not be great quantities of grass.

35,655. Is it very heavy land?—Yes, it is all heavy land, although some of that that I was speaking of last is woodland description of land, not so heavy as some.

35,656. Is the cultivated part, the arable, mostly heavy?—The arable is mostly heavy; you would put it down as heavy land.

35,657. Heavy clay land?—Clay subsoil.

35,658. Is it land mainly suitable for growing wheat?—Mainly suitable for growing wheat and beans.

35,659. What do you grow yourself?—I go in for wheat and beans principally—they are my best crops; my land is hardly adapted to barley, and we cannot get the quality.

Laying land down to grass.

35,660. Have you laid any land down to grass yourself?—Just previous to my going into the farm the Duke of Bedford put down 46 acres. Some portions of it have done fairly well, whereas the other is none too good, but I intend putting down 20 or 30 acres next year myself. The Duke will find seeds for his tenantry if they will put them down.

35,661. What do you consider it costs you to lay down the land in grass?—The seed would cost about 1*l.* or 25*s.* the acre I should imagine; I do not know exactly what it would cost.

35,662. Have you got any old grass in your farm?—Yes, I have some very good pastures.

35,663. How much?—The proportion would run about 260 of grass and 210 arable, but, of course, it would not be above 100 acres of it we should term feeding lands—hardly so much as that perhaps. It is a good second rate pasture with the exception of that newly sown down, and it will take some time to make that good.

35,664. Have you lost money of late years?—Yes.

Large and small farmers.

35,665. Do you think the large tenant farmers in your district have done better than the smaller ones?—I do not think any of them have done well, but I consider that the large farmers have a better opportunity perhaps of making both ends meet than the smaller ones, because they can adapt machinery better than the smaller ones.

Land unlet.

35,666. If a farm is vacant with a fair amount of pasture, fairly good land, can it let?—Yes, there is not much land unlet in my immediate neighbourhood. I

Mr. G. Brown.
22 Nov. 1894.

believe that in the north of Bedfordshire there is a wonderful lot that cannot be let at hardly any price at all.

35,667. Do you yourself know this land?—I have been over it. It is some 8 or 10 miles from me. I was speaking to Mr. Howard about it last Saturday; he said he could recollect when on all that land north of Bedford you could see splendid flocks of sheep; now you can go miles and not see a sheep.

35,668. What quality of land is that?—That is stiff heavy land.

35,669. Is it worse than yours?—Yes, it is decidedly.

Land in hand.

35,670. In your own immediate district you say the land is not unlet?—There is a good lot in the landowners' hands—a fair lot, more especially if we get away to the Buckinghamshire side, Cranfield, North Crawley, and that way; there there is a good deal of such land.

Condition of labourers' wages.

35,671. With regard to agricultural labourers in your district can you give us any information?—As regards the general condition of them in my immediate neighbourhood I think that they were never better off in their lives. They are having now fair wages and everything is cheap; and I should say they were never better off. Their wages just round us run to 12*s.* a week for ordinary labourers. Of course they get piecework during the hoeing season, and in hay time and harvest they get extras. Stockmen and horsekeepers get from 14*s.* to 15*s.* a week, with a bit extra at haytime and harvest.

35,672. Have the wages been decreased during the last few years or not?—No, I should say not. One reason that has kept them up is that the Midland Railway have been making an extension just through our district during the last two or three years. That has taken out from the parishes of Marston and Wooton I may say quite 40 men. Had those 40 men been seeking for employment in our two villages, I do not know where the wages would have got to.

35,673. As it is, the competition of other employment has kept the wages up?—Yes. The cottages on the large estates I may say are very good indeed.

Reduced labour.

35,674. Has there been much reduction in the number of labourers?—Most of the villages have grown less.

35,675. Is that due to the less employment of the labourers on the farms, or what?—There is no doubt about that, I think.

35,676. On your own farm has there been a reduction in the number of labourers?—No, I do not think there has been.

Changes of tenancy.

35,677. Has there been much change of tenancy in your district?—Yes; I think there is only one farm in the parish in which I live that is really occupied by a resident farmer but what has changed hands during the last ten or a dozen years.

35,678. Has there been much change on the Duke of Bedford's estate?—There has been some, but perhaps not so much as on others—smaller estates.

Rural depopulation.

35,679. Do you account for the reduction in the number of labourers by the attraction of the towns and by the better wages in other industries?—Undoubtedly. They get their education free in our villages, and they they go off and they get better opportunities of getting places in the towns and on the railways, and there is more attraction for them. They go there and will do more and more I imagine—it will get worse.

Effect of the drought, 1893.

35,680. Did the drought of last year tell heavily against your district?—Yes.

35,681. Especially in respect of stock?—Yes.

35,682. Did it depreciate the value of stock?—Yes.

35,683. Had you to sell some of your stock on account of the want of food?—Personally I got through very well, but in the immediate locality there was a lot had to be sold at ruinous prices. As everybody is aware there was no hay or straw, and the consequence was that the stock had to be sold at any price. Of course for those who could keep it on to the spring, till May or then, it answered their purpose very well indeed.

The season of 1894.

35,684. What has been the result of the present season?—It was a year of the greatest promise perhaps that we have had for many years; then came a downpour of rain in the harvest time and which spoilt all the prospect entirely. The barley is very much damaged. In my own case I shall not have a bit of barley fit to sell—not for malting, and the wheat is altogether out of condition and is not fit to thresh yet. Perhaps it is a good job it is not; I may make a little more of it later on perhaps. I am afraid there will be a very small breadth of wheat got in. I say "afraid," but perhaps it might be a good thing. I think there will be a very small breadth of wheat put in this year, owing to this wet.

Mr. G. Brown.
22 Nov. 1894.

The season of 1892.

35,685. Did your district suffer in 1892; was that a bad season too?—Yes, we suffered very much. The beans were a perfect failure that year. We suffered with the fly.

35,686. Then you have had three bad seasons in succession?—Yes.

35,687. 1892, which was a very wet one?—Yes.

35,688. 1893, which was a drought?—Yes.

35,689. And 1894, which had great promise, but which was spoilt by the harvest?—Yes.

Low prices.

35,690. How do you account for the low prices?—It is foreign competition, I think, that undoubtedly knocks them down.

Reduction of rent.

35,691. What recommendations have you to make; do you think the rents are too high even now?—Yes, I think the rents must come down. It is undoubtedly owing to foreign competition, and there is no doubt a great deal of that is brought about by their having nothing to pay, and we are taxed for everything, as it were. I think the country would find it out in case we get into war; they would find they would have to pay very highly for their corn. It is not only with reference to corn, but it is also the same with reference to meat. During this last month or six weeks there were three or four shops opened in the town of Bedford for the sale of foreign meat. There you can go and buy any joint you like for 6*d.* a lb.; it is not over good, but still it takes the trade away from the British farmer.

Sale of foreign meat.

35,692. How much a lb. do you say?—6*d.* a lb. Nothing over 6*d.* in these shops; it is astonishing the amount that they do sell.

35,693. (*Mr. Channing.*) Is that beef or mutton, or both?—Both.

35,694. Argentine as well?—I do not know where it comes from. It is only quite recently that this has been introduced, during the last month or so. It is said to be foreign meat; what it is I do not know.

Rates.

35,695. (*Chairman.*) Then you think the rates are unfair, especially the highway rate?—Yes, I do.

35,696. What do your rates amount to in the aggregate in the £?—In the aggregate they amount in the present year to 3*s.* in the £. The poor rate is 10*d.*, county rate 10*d.*, highway rate 7*d.*, and school board rate 9*d.*

35,697. Then you have already told us about the assessments to the local rates; now what have you to say with regard to the tithe?—With regard to the tithe I do not know that I have much to say upon it; it is really a question of rent as it were, but still I have some land tithed at 10*s.* an acre, and it really looks as if some portion of that tithe should contribute something towards the maintenance of that land in proper tenantable repair. I should like to say a little as to the education rate.

35,698. What have you to say about that?—I think that that should be a national question, instead of being, as it were, practically all thrown on the farmers' hands in the rural districts. We educate those lads, and the smartest of them, as soon as they are educated, go straight away; we have not the slightest benefit from them; they leave us the dullards. In the parish I live in the education rate has varied between 9*d.* and 11*d.*, I believe, since the Education Act was passed. In my own case, at the time I held the Beancroft Farm and the one I now hold, I was paying on a rateable value of between 700*l.* and 800*l.*, and they made me pay something over 30*l.* to the school board. Under the National system we used to get off with 2*l.* a year, that is, 1*l.* on each farm used to be the contribution. Of course that is an extra tax that we had no idea of in taking these farms. That is only an example of all of them. Then the highway rates; it seems most unfair that the land should be called upon to put the roads in that state of efficiency which they now are in, for the big brewers, millers, and tradesmen generally, who do nine-tenths of the wearing of the road, and yet contribute practically nothing to the cost. In the time of the old turnpikes they used to contribute a fair share,

Mr. G. Brown. 22 Nov. 1894.

but as soon as the turnpikes were done away with it all came straight on to the land. That is certainly an addition which I think the land should not bear. Our district roads cost us 7*d.* in the £. Then there will be the rate for the county council, whatever that may be, for the maintenance of the main roads. I think there could be no fairer tax than the van and wheel tax, and I had hoped to have seen that passed when it was brought in, but unfortunately it was not. Then the sanitary rates; they are a thing that undoubtedly will come to the front. There is, no doubt, a greater demand for sanitary matters generally, and I really do not see why the land should contribute at all. It looks to me that the owners of cottage and house property should put their places in a thoroughly sanitary condition. More especially is that the case in towns. In the town of Ampthill, for instance, there is land that is rated to that town, which you cannot get at from the town without going two miles round, but that has to contribute to the lighting rate and the sanitary rate, and anything of that sort. It does seem wrong to call upon that outlying land to contribute anything at all to those things.

35,699. Is your union the Ampthill Union?—Yes.

Compensation for tenants' improvements.

35,700. Then with regard to the tenant's compensation for improvements, what is your view?—I think that a tenant should be secure in his holding so long as he farms it well, and that if moved he should receive full compensation for any improvements that he has made. I consider that one blot in the Agricultural Holdings Act is the fact that no note is made of how foul a farm may be on entering. If a man leaves a bit of foul land, he has to pay for it in the shape of dilapidations, and I think it should be worked in exactly the contrary way too, and that a note should be made on the entry of a farm of its condition, and if it is found that a man improves it, he should receive compensation for having improved that farm.

The law of distraint.

35,701. Are you in favour also of the abolition of the law of distraint?—Yes, I think that that is a law which does not act in the interests of the farmer who has a fair amount of capital. If that were done away with, no doubt the landlord would look to men with capital, and they are the only men who can make farming pay at all, and he would take care to have a man who had capital. Now there are plenty of men offering to take farms without capital, and as a landlord has the power of distraint they have the opportunity of getting in, and of outbidding the genuine farmer, and so of keeping rents up.

Agricultural education.

35,702. Then with regard to agricultural education, what are your views?—In the county of Bedford the technical committee of the county council has done a goodish deal in that way. We have had classes for dairying, lectures on fruit growing, prizes for stacking, thatching, hedging, ditching, ploughing, sheep-shearing, and shoeing competitions. Those five or six items are carried out by the agricultural society, the money of course being found by the county council. In addition to the experimental farm which is worked by the Royal Agricultural Society, the Duke of Bedford has just given us a farm of about 111 acres for a farm school, for 20 boys, and he is also planting a fruit orchard. It is to be hoped that these things will do good, but really I cannot see that they are going to do much good unless we get better prices to make them answer.

35,703. Then you are generally in hopes, at all events, of better prices and lower rents?—I cannot see any advantage to the farmer unless he gets better prices for his produce. Rents must take their natural course.

35,704. (*Mr. Channing.*) In connexion with education, can you give us any information as to the working of the system of scholarships, given, I think, by the Royal Agricultural Society?—I cannot say much about it. That goes before the technical committee. I am not on the technical committee, although I am on the county council as an alderman; I have not followed that very closely.

35,705. You do not know any sons of farmers in Bedfordshire who have availed themselves of it?—No, I do not know of any of them; in fact, I think very few farmers' sons are being brought up to farming.

35,706. How long has the Duke of Bedford been carrying on this experimental farm school?—It was only at the last meeting of the council that we accepted it, so that it is really not yet in working order.

35,707. How are the boys to be admitted to it?—They are to be taken, as I understand, 10 boys a year from the brightest and most intelligent boys that can be found in the local schools, and they are to have two years there, about half the time at practical work and the other half at book-work. That will ultimately make 20 boys in the school.

Mr. G. Brown. 22 Nov. 1894.

35,708. From the elementary schools?—They are to be taken from the elementary schools.

35,709. Is your land exceptional feeding land?—It is good feeding land.

Stock-keeping.

35,710. Do you keep a large quantity of stock?—Yes; a little over 100 head.

35,711. Do you breed or buy?—Both. I breed and wean calves, and also buy perhaps 30 bullocks in the year to feed.

35,712. (*Sir Nigel Kingscote.*) Do you dairy?—Yes; only about ten cows; just enough to do a bit of weaning.

35,713. (*Mr. Channing.*) You spoke of losing money. Could you define in what part of the business you lose money; do you lose money on this land that you pay 40*s.* for?—I cannot quite define it—it is on the farm generally. I think the stock has paid as little perhaps as corn of late years.

35,714. You have not found that part of your business help you out with the wheat?—No.

Wheat growing.

35,715. Do you propose going on growing wheat at present prices?—I shall materially curtail the quantity grown. I mean to sow down a certain quantity of land, and instead of growing 80 to 90 acres of wheat this year it was not my intention to grow more than 60 anywhere; but I shall not be able to grow as much as that owing to the wet state of the land.

Land laid down to grass.

35,716. How does laying down to permanent pasture on these Bedfordshire clays answer?—On the poorer clays it does not answer at all well.

35,717. Do you have temporary grasses there for a year or two and then take them up?—In some cases it has been tried, but I think it is generally left down; if it will do at all it is generally kept down.

Restrictions.

35,718. Have you mentioned whether there are any restrictive conditions and whether they are strictly observed?—I think the times will beat the restrictions. I think we have restrictive covenants in our leases or in our agreements.

35,719. But practically they are not maintained?—They are not. In the last year of the tenancy I think perhaps it is only due to the landlord that they should be carried out. On the Duke of Bedford's Estate, he is rather particular about the land being left in fair condition—fairly straightforward.

Landlords' improvements.

35,720. Is there a heavy outlay on improvements and repairs on this estate—I suppose there is?—He is a first class landlord in that way.

35,721. Therefore he naturally looks to the tenant keeping up his part of the bargain?—Exactly.

Uncultivated land.

35,722. Can you give us any information as to the land that has actually gone out of cultivation or been abandoned in your neighbourhood—is there any land which you would call derelict, which is not occupied at all?—There is not a great deal, there is some, for instance, we have one little bit of 20 acres, I dare say altogether—the allotments that are actually out of cultivation, and there is one farm of 100 acres. The man left a portion of this Wroxhill farm of which I spoke. I do not think that is cultivated at all; the man failed at it some 12 months ago, and I think that is entirely derelict.

35,723. And cannot be let again?—No.

Security of tenure.

35,724. You spoke of a tenant having some security in his holding as long as he worked his farm well?—Yes.

35,725. Would you define that in any way?—I cannot quite define it.

35,726. Will you put it in the form of a loss?—No. Supposing you get a change of stewards and you do not quite get on, I do not think that the tenant should be chucked out, unless there was some strong reason for his being put out.

35,727. You do not think that he ought to be put out as long as he works his land well, and carries out his covenants?—No.

35,728. In case he is turned out under those circumstances, would you say anything as to the compensation for improvements; would you give him a claim for cost of removing if turned out under those circumstances?—I would give him compensation for everything due to him.

Mr. G. Brown.

22 Nov. 1894.

35,729. In improvements. But in the case of costs of removing?—No, I am not quite prepared to say anything about that.

Assessment to rates.

35,730. About the assessment, in your union, in the town of Ampthill, and in the rural parts do you think that the assessments are equally made in the urban district and in the rural district, or do you think there is any difference between them?—We have just now a difficulty cropping up, with reference to the town of Ampthill. It seems to be everybody's and nobody's duty to raise the assessment of the town property. There is a lot of property in the town which has been improved, but the overseers scarcely like to shove it up. That question is just coming before the Board, and we shall have to deal with it in some way. We have not much house property in the locality other than in the town of Ampthill.

35,731. Do you think that the assessments in the town of Ampthill are too light in proportion to the assessments of the rural districts?—In many instances the house property is too low. One village I believe will be taken to-day there; there is a considerable improvement in the house property—and we propose raising in many instances the houses.

Losses from farming.

35,732. I do not know whether you care to answer this question. What would you put the loss per acre of the farmer working a farm such as you are working during last few years?—Well, take the wheat as an instance. I should suppose the average quantity of wheat grown would be something like four quarters; that wheat used to average at least 2*l.* a quarter; it is not worth 1*l.* now, and that would bring a loss of 4*l.* per acre upon that. You may take barley, and beans, and oats, at quite the same quantity, and put them down at 10*s.* per quarter lower than the average prices that they have been for some years past.

35,733. That would be a depreciation in the gross value of the produce. But what I mean is the loss of working the farm per acre?—I could not give it quite. It must be apparent that the expenses are quite as heavy now as they were when wheat made 2*l.* per quarter, and barley 35*s.* a quarter.

35,734. Do you think that the rents such as you are paying are incompatible with the profits?—If the Duke of Bedford was charging us anything like the full rent it would be far beyond its value.

35,735. But even with the reduction the rent is more than it is worth?—Yes.

35,736. (*Mr. Little.*) Which was 50 per cent. last year?—Yes.

35,737. And even that did not meet the loss?—Those figures I have given are more than the rent—double the rent.

Labourers' cottages.

35,738. (*Mr. Dalton.*) Have you got good cottages in your parish?—No, unfortunately, the Duke of Bedford does not own the parish. I pay rent in one parish, Millbrook, in which the cottages are wonderfully good—they are all belonging to the Duke of Bedford; but in the particular parish in which I live the houses are built on the waste, and they were put up by little men themselves, and they are a very poor lot of cottages indeed.

35,739. What are the rents?—They range from 1*s.* 4*d.* to 2*s.* a week.

35,740. If these cottages that belong to the little men were put into a sanitary condition, and they were charged entirely on the sanitary rate, would they be able to pay it?—I think that they should do.

35,741. Could they?—I think that is a matter for the owners to do it—it is not a very heavy matter the sanitary rate—this year we have had no sanitary rate.

35,742. But are you expecting any of those cottages to pay the sanitary rate?—There will be probably a water supply to be found all up one end of their village. I do not know where it is coming from, but it will be a question to consider.

35,743. It will be a heavy expense?—Yes.

35,744. How far are you from Bedford?—About six miles by rail, and a little further by road.

35,745. Have you a good market for produce?—A very good market.

Rates.

35,746. About your school board expenditure; can you say how much of that falls upon the rates, and how much is covered by the Government grant?—I have not the figures before me. I am a member of the school board.

35,747. Do you know the proportion; does the Government grant cover half of it?—I do not know; I should not like to say off hand; we have a wonderfully good grant.

Mr. G. Brown.

22 Nov. 1894.

35,748. A large grant?—Yes, it has been wonderfully good for several years, but it is the building that makes our school board rates so heavy. In the Duke of Bedford's villages his Lordship finds them schools. In the parish of Millbrook to which I contribute I think the rate was only about 2½*d.* or 3*d.*

35,749. Your poor rate does not seem high, does it?—No.

35,750. Has it gone down?—I could not say off hand.

35,751. What makes your county rate so high?—The highways are one of the principal things.

35,752. Does not the Government grant nearly cover that?—No.

35,753. Originally one half of your main roads were paid out of the Government grant. Then in 1888 you got a very large increase over and above that half of the cost of the main roads; you cannot say to what extent?—No, I cannot.

35,754. You cannot say to what extent the Government grant covers the main road expenditure?—No.

35,755. Has your ordinary highway rate gone down?—The district rate has because the main roads have gone off, but they are now about 7*d.* in the £.

35,756. Has the county taken over many of the highways as high roads?—In some portions of it more than others; we have some splendid roads in Bedfordshire.

Depression in Bedfordshire.

35,757. (*Mr. Little.*) The county that you come from has suffered peculiarly from the depression, has it not?—Yes, in many parts.

35,758. In the strong part of it?—In the strong part of it.

35,759. A considerable portion of the country is strong clay adapted for the growth of wheat and beans, and at present you have not found anything that will take their place?—No.

35,760. You cannot grow good barley?—No.

35,761. It does not take kindly to grass?—No.

35,762. And you do not see any outlook for growing profitable crops?—I cannot see anything that would improve the situation but better prices.

Steam cultivation.

35,763. Do you think that that strong land has been injured by deep steam cultivation in the past?—No doubt it has injured it to an extent—no doubt it has.

35,764. There is a very general idea that that is so?—There is not the slightest doubt about that.

35,765. (*Mr. Channing.*) How has it been manured when it has been under deep cultivation?—It is a well-known adage, if you do steam cultivation you must use double the amount of manure.

35,766. And that has not been done?—It is impossible to do it, because, as a rule, the farmer contributes all that he can, and the manure goes back on to the land. You can go and purchase it, perhaps, but it would hardly answer the purpose at the present prices of corn.

35,767. But fertilisers have been cheaper?—Yes.

35,768. (*Mr. Little.*) Is it not universally admitted that the texture of the land, if I may use the term, has not been improved but injured by steam cultivation?—The cultivator pulls up a lot of stiff clay stuff that is not fitted to come to the top—it was much better where it was; and farmers who have used it, good practical men—have given it up, and where you used to see two or three sets running where I was, it is very rare to see steam-cultivation tackle at work now.

Rates.

35,769. I think that the education rate was imposed upon your farm after you took it?—Yes.

35,770. And the effect of that Act was the same as if Parliament had imposed an income tax of 1*s.* 6*d.* or 2*s.* in the £?—Not quite so much.

35,771. The ninepenny rate upon the assessment, that would be something like 1*s.* 6*d.*, or approaching 1*s.* 6*d.*, would it not?—I do not quite follow you—it would be a tenpenny rate on the farm.

35,772. But the rate is levied upon the whole, and the income tax is levied upon half?—I beg your pardon, yes.

Mr. G. Brown. 22 Nov. 1894.

35,773. Would you say that the effect of that Act was the same as if the income tax had been raised as much as 1*s.* 6*d.* in the £?—Exactly.

35,774. And on the parish of Millbrook, where you occupy land, though the rate is not so high, that is because the landowner, the owner of the parish, has built the school, for which he only charges a nominal 10*s.*?—That is it. I should like to make a remark upon the malt tax. One of the largest buyers in Bedford market was speaking to me on Saturday about it. He pointed out that the duty on the malt used to be taken from the tank after the couch, I think they call it. Now the foreign barley will absorb considerably more water than the English barley. It would rise a couple of inches, whereas the English barley would not rise more than 1½ inches. The consequence would be that foreign barley would then contribute considerably more in taking it that way than the English barley, and it would so far put the foreign barley out of court by increasing that cost in the shape of the tax, whereas when it comes to get dry that would go back, and you would get no more extract from that foreign barley than from English barley; and if that tax was re-imposed that would probably add 8*s.* or 10*s.* per quarter on the price of English barley.

Quality of labour.

35,775. You said that the labourers' wages had kept up, but that the quality of labour was inferior. Is that the case generally?—I think so. They do not seem to have the interest in the farm that they used to have in years gone by. I can only account for it by the best of them going away.

35,776. Are they less capable or less willing than they were?—They do not take so much interest in the farming work. The old folks would stop all day long and all night if you wanted them to do anything.

35,777. Your county is well provided with allotments?—Yes.

Allotments.

35,778. You said that amongst the derelict land in your neighbourhood there were about 20 acres of allotments?—Yes.

35,779. Is that in one parish?—Yes, in the parish of Marston.

37,780. Is that because the labourers have gone away in such numbers?—No; because they find it does not answer.

35,781. Is that particularly strong land?—It is strong land.

35,782. Do they cultivate it with the spade, or did they do so when it was cultivated?—It was generally cultivated with the spade. Some of them plough it. We have a big quantity of allotments in the village.

35,783. Are they more than half an acre?—Yes, some are three and four acres.

35,784. Do they grow corn as well as potatoes?—They grow corn principally, I mean to say those larger ones. Some of the smaller ones, the half-acre men, would take a fair proportion of potatoes.

35,785. The effect upon them has been the same as upon the farmers, then?—They are sick of it a good lot of them.

35,786. (*Mr. Gilmour.*) Do leases obtain in your part of the country?—No, there are not many leases.

Security tenure.

35,787. Do I understand you to say that you would consider it right that, unless for some special reason, the tenant should sit on on his farm or get paid owing to the lease being concluded?—I do not think that a tenant should be turned out of his farm unless there was some good reason for his being removed. I think that he should feel safe in his holding. To give you an instance; for some time the Duke of Bedford spoke of selling the farm that I hold at Beancroft; I was uncertain as to who was to be my landlord; I did not know whether to go on farming, as you may term it, well or not. I thought perhaps I might leave as soon as the Duke sold it. That went on; the Duke did not offer it that year; he offered it the next year and it was sold. My landlord wanted as much rent as he could get for it; I was uncertain as to what I should do; and the consequence was that the farm was not done so well as I should have done had I been secure.

35,788. Have you thought out under what authority you would put such a delicate matter to be settled by?—No.

Compensation for home-grown corn.

35,789. I notice in your proof that you consider compensation should be given for all corn consumed, whether home-grown or not?—Yes.

35,790. Would you include carting horses?—Yes, I know that they benefit the land. For instance, this year my barley happens to be unfit for malting, and it will be ground down; and under the Agricultural Holdings Act I should get no compensation for that.

37,791. (*Mr. Little.*) What is your barley worth today?—It would not be worth more than a pound per quarter. It was a heavy crop, and it went down before the rains just at harvest time, and there it was, and that will all have to be consumed on the farm; and so it is with a lot of the inferior wheat.

35,792. (*Mr. Gilmour.*) Have you considered in what way this could be carried out so as to be sure that there would be no fraud carried on in this home consumption of produce?—I think that a way could be found. I think that evidence could be taken on oath from the tenant and he should prove it in some way if necessary that might be easily safe-guarded.

35,793. Do the farmers in your locality keep sufficiently accurate accounts as to the produce in their stack-yards, or that they thresh out to enable that to be done with any chance of success?—If they were called upon they would have to do so, and if they could not produce satisfactory accounts they must put up with the consequences, and they could not claim.

35,794. But you think it could be practically carried out to be fair to both parties?—I do.

Depression in Bedfordshire.

35,795. (*Mr. Clay.*) As a general rule in Bedfordshire are the farms going from bad to worse?—Undoubtedly it is so, and we are simply living in hopes of better times.

35,796. What is the reason of that?—This foreign competition. We cannot grow our stuff so cheaply.

Rents.

35,797. Have not high rents anything to do with it?—I do not think high rents have much to do with it. We have a lot of land that is unlettable, and therefore it cannot be a question of rent there. Besides they could not make 10*s.* an acre. There are thousands of acres in Bedfordshire that would not make 10*s.* an acre.

35,798. Are you making a profit of your farm?—No. I also carry on another business. I work a threshing-machine business with my farm, and they run into one another. I cannot separate them very well. When my men are not at work with the machines they are at work on the farm. It is a difficult matter to separate the receipts of the one from the other.

35,799. You pay about 500*l.* of rent?—I pay 628*l.* altogether; that is what my rent stands at.

35,800. If it would not pay at 500*l.*, would it pay at 300*l.*?—I do not think it would. I do not think rent is much of a question. Of course my landlord has heavy charges to meet; he is a good landlord; he keeps us well done with repairs and that sort of thing; and there are certain estate charges we must expect to pay; and he spent 100*l.* on my farm, and drained my land for me at a considerable cost.

35,801. From a business point of view is it not a fact that it depends upon whether you pay a high or a low price as to what profit you get?—Yes, and rents must go down.

35,802. You now admit that rent has something to do with it?—Of course if I could get the farm at half the rent it would be better

35,803. You say in your proof rents are too high. That shows that you had it in your mind that they must come down to enable a tenant to live?—They must come down.

35,804. And one of your remedies is low rents?—Yes.

35,805. Is the want of capital owing to the tenant having paid too much in the past to the landlord?—No doubt it has kept the tenant bad.

35,806. And if there had been a reduction or remission of rent sooner the tenant would have had that extra capital to put on the land?—I think that is very fairly exemplified on the Duke of Bedford's estates. He has met his tenants fairly liberally with remissions, and he has not had so many changes of tenants as the smaller landlords, who could not, or would not, make reductions.

35,807. If there had not been so high a rent exacted from the tenant the tenant would have had more capital to carry on the business of his trade?—Undoubtedly.

Mr. G. Brown.

22 Nov. 1894.

Results of farming.

35,808. (*Mr. Whitehead.*) We gather from your evidence that you have, on the whole, done better than your neighbours in farming?—I do not think so.

35,809. I thought you said so?—No.

35,810. You do not admit that?—I do not at all. I have done no good at farming during the last six or seven years, and I have lost money. If I had not had other means I should not have been where I am now.

Allotments.

35,811. (*Mr. Channing.*) I wanted to ask you one question about the allotments which you say have been abandoned. Is that partly owing to there being better land and more accessible that had become available for the same labourers to use for allotments?—I do not think we have had any extension of allotments in our particular village for some years; therefore, I do not think that would apply. I think it is simply because they have been worn out, and perhaps that it is not good land.

35,812. Has the land itself been worn out?—The allotments do get worn out gradually. The allotment holder has not manure to put on and keep the natural fertility of the land, and the allotment gets gradually worse.

35,813. Is it your experience that your allotment holders use up the corn that they grow themselves?—No, I think not.

35,814. Do they attempt to sell it?—Yes; more especially the bigger men. Some of the smaller grind a couple of sacks, but the larger holders sell.

35,815. Has the very cheap price of flour had any effect in making it less desirable to grow corn on allotments?—They know it, and many of them will tell you that the allotments are not much good to them.

35,816. Now that flour is so cheap?—Yes; they cannot grow it at the same price as they could get it. On this question of allotments I may say that the Ampthill Board had laid out at Lidlington a field of 20 acres, and the men have taken it and seem to be doing very well with it—they are paying the rent.

35,817. (*Sir Nigel Kingscote.*) What sized plots have they got?—Some of them have an acre.

35,818. (*Mr. Little.*) What kind of soil is it?—It is clay, but not so bad clay as some. We are just about to let at Steppingley 14 acres owned by the Duke of Bedford.

Mr. G. Brown.

22 Nov. 1894.

35,819. (*Sir Nigel Kingscote.*) Is that let by the local authority?—By the sanitary authority.

35,820. But the land belongs to the Duke of Bedford?—Yes.

Rents.

35,821. With regard to your own rent, I understand that on part of your farm you pay the Duke of Bedford 20*s.* per acre, and he has given you a remission of 50 per cent.?—Last year it was 50 per cent.

35,822. And he pays the tithe, which is 4*s.*, and, therefore, that would leave him only 6*s.* per acre to keep up your farm?—Exactly; and in some instances some of my farm is tithed at 10*s.* per acre.

35,823. (*Mr. Little.*) And there may be land tax besides?—Yes, there is a heavy land tax in the parish of Marston.

35,824. (*Sir Nigel Kingscote.*) Who pays that?—The landlord.

35,825. (*Mr. Little.*) Then the margin of possible reduction cannot be large?—Not for the landlord.

Cattle disease.

35,826. (*Sir Nigel Kingscote.*) With reference to another subject: have you suffered at all in your part of the world from cattle disease?—Not of recent years. We did suffer two or three times with foot-and-mouth disease. We had two or three times visitations, and one bad visitation of the cattle plague.

35,827. Do you approve of the restrictions placed upon cattle?—I was going to say we have to thank those gentlemen who keep the restrictions on as long as possible.

35,828. Have you had any experience of swine fever?—Never in my own place, but it has been all round us.

35,829. Do you approve of trying to get rid of that in the way they are suggesting?—I believe in their stamping it out, but there is a great deal of opposition from the pig dealers, who make more to-do about it than the farmers. I think that the farmers would put up with a little annoyance if they could get rid of the disease.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Sixty-fifth Day.

Friday, 23rd November 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. R. J. Epton.

23 Nov. 1894.

Mr. R. J. Epton called and examined.

35,830. (*Chairman.*) You are a farmer residing at Wainfleet in Lincolnshire?—Yes.

35,831. And you farm about 472 acres at Belchford in the county of Lincoln, and a farm at Wainfleet of about 1,238 acres?—Yes.

35,832. And also some other small farms?—Yes.

Rent of witness's farm.

35,833. What was the rent of the Wainfleet farm in 1879?—The rent of the Wainfleet farm in 1879 was 2,332*l.* The tenant paid the tithe as well, which was 355*l.*, and the Land Improvement Company was paid for drainage and so on, 259*l.*; the total rent was, therefore, 2,946*l.*

35,834. What have been the reductions since then?—In 1887 the rent was reduced to 2,200*l.*, the landlord paying the tithe and the interest to the Land Improvement Company, and in 1891 the rent was further reduced to 1,900*l.*

Mr. R. J. Epton.

23 Nov. 1894.

35,835. Is that what it now stands at?—That is what it now stands at.

35,836. In the case of the other farm what do you say?—The other farm is my own land. That of which I have been speaking is the 1,238 acres.

System of cultivation.

35,837. Has there been any alteration in the system of cultivation of the farm?—No.

Mr. R. J. Epton. 23 Nov. 1894.

35,838. It is an arable farm, I suppose?—There is about 406 acres of pasture and the rest is all arable. The other is ordinary cropping—all arable.

Results of farming.

35,839. Will you give an illustration of what the result of farming has been during the last few years?—The receipts from farming of the last few years have been very much decreased. The corn crops especially have been brought down. I can give you the wheat crop for every year from 1868, but that would take more time than necessary, perhaps. I have drawn it out on an average of eight years. From 1868 to 1875 my wheat averaged 35¼ bushels per acre, and was sold at an average price of 52*s.* 4*d.* per quarter; the average per acre was 11*l.* 11*s.* 8*d.* in those eight years. In the next eight years the seasons did not come right and I had only 24¾ bushels per acre and that sold at 46*s.* 3*d.* per quarter, making an average of 7*l.* 3*s.* 2*d.* per acre.

35,840. (*Mr. Chaplain.*) The seasons partly accounted for that then?—Yes. From 1884 to 1891, the next eight years, the quantity came to 36½ bushels again; and that sold for 33*s.* 3*d.* per quarter in the eight years, making 7*l.* 12*s.* 2*d.* per acre. In the last two years, 1892–93, the average production was again just the same, 36½ bushels, and that sold for 26*s.* 2*d.* per quarter, being only 5*l.* 19*s.* 1*d.* per acre. As I grow about 220 acres of wheat each year, the price that I made on the last two years was 1,240*l.* less than it was the first year.

35,841. (*Mr. Little.*) Have you estimated your crop of this year?—I have threshed no wheat.

35,842. Have you estimated it?—Yes, I estimated it about 1,600*l.* less than the average of the first eight years that I have accounts of.

35,843. (*Chairman.*) What quantity have you produced per acre?—I have taken it at the same as I got the other two years—36 bushels. I have not threshed it, so that I do not know, but I think it will come to that.

Bad seasons.

35,844. I suppose your land did not suffer much from the drought?—No.

35,845. The average produce was maintained, then?—Yes, it was last year.

35,846. Have the last three years, including the present, been bad years as regards the seasons?—We have had an average quantity for the three years.

35,847. Apparently rather above the average of 1868 to 1875?—About the same average.

Low prices.

35,848. Rather above, if anything, but the price, of course, has been much lower, and the nett result has been very much worse?—Yes, it is 5*l.* 19*s.* 1*d.* per acre instead of 11*l.* 11*s.* 8*d.* per acre. The barley has gone down a good deal, and I am afraid the barley crop is a very bad one.

35,849. Is that owing to the harvest being a bad harvest?—Yes, the weather did not quite finish the barley; it is of a bad quality. I think the light barley harvest will be 600*l.* less than the average of the earlier years. Then with regard to the live stock, the sheep have been cheap until this year, but the wool (and I sell about 350 tods of wool a year) averaged the first 17 years 44*s.* 6*d.* per tod, but the last 17 years it only averaged 24*s.* per tod, so that that makes nearly 400*l.* deficiency in that item as well.

Reduction of rent.

35,850. You speak of your rent having been 2,332*l.* in 1879, and the tenant paying tithe, 355*l.*, and the interest on loans 259*l.*, making it 2,946*l.* Now does the present rent of 1,900*l.* compare with 2,946*l.*?—Yes, it does; the landlord makes the other payments.

35,851. The landlord pays the tithe and the interest on the loan?—Yes.

35,852. So that the reduction has been from 2,900*l.* to 1,900*l.*, a reduction of 1,000*l.*?—Yes.

Wages.

35,853. Have you been able to make any other economies in the management of your farm?—The wages have been reduced slightly; my wages will be less by about 350*l.* The wages last year were 13*s.* 6*d.* per week. They used to be 16*s.* 6*d.* per week, and we have got men this year at 12*s.*

35,854. (*Sir Nigel Kingscote.*) Do you employ about as many men?—Yes.

35,855. (*Mr. Chaplin.*) So that the wages are reduced 4*s.* 6*d.* per week?—3*s.* per week up to this year, but 4*s.* 6*d.* now.

35,856. Your wages are now reduced 4*s.* 6*d.* per week?—Yes.

35,857. (*Chairman.*) What was the highest point that the wages reached?—16*s.* 6*d.* for the winter wages.

Mr. R. J. Epton. 23 Nov. 1894.

35,858. When were they raised to that point?—About 1874 to 1879, or somewhere about that time.

35,859. What were they before 1873, say?—They were gradually increased; they started at 12*s.*, and got up to 16*s.* 6*d.*; and they have been gradually going down again.

35,860. Was there not a sudden rise in 1873 and 1874?—Yes.

35,861. What were they immediately before that?—About 13*s.* 6*d.*

35,862. They were 13*s.* 6*d.* in 1873, then they rose to 16*s.* 6*d.*, and then they went down to 13*s.* 6*d.*, and at present they are 12*s.*; is that so?—Yes.

35,863. (*Mr. Chaplin.*) And they were never higher than 16*s.* 6*d.*?—I am speaking only of winter wages; summer wages are a great deal more, and the summer wages have not been decreased.

35,864. (*Chairman.*) The summer wages have not been decreased?—No.

35,865. What are the summer wages?—It is a good deal of it piece work.

35,866. The differences between 16*s.* 6*d.*, 12*s.*, or 13*s.* 6*d.*, are only applicable to the winter months?—For seven or eight months in the year.

35,867. (*Mr. Little.*) What do they earn at piece work?—Slightly more than ordinary wages—sometimes a good deal more; they have longer hours.

Changes in system of cultivation.

35,868. (*Chairman.*) Have you laid down any land to grass on your farm?—Not any more. I have laid down one or two fields and taken one or two in, and that leaves it about the same.

35,869. In the main they are under the same cultivation as before?—Yes.

Profits of farming.

35,870. Have you effected any other economies towards meeting this great fall in prices?—No, very little. I have made an estimate here for the years 1892–1893, and I have compared them with the years 1868–1875. I think that my farm produced 2,600*l.* less than in the earlier years. The wheat was 1,240*l.* less; the barley, 627*l.*; some other crops (peas and other things) 78*l.*; and the wool at 1*l.* a tod less represents a loss of 350*l.* Then I sell about 800 sheep a year; that is a reduction of 200*l.*: and the beasts reduce it to 285*l.* Altogether I estimate that there is a reduction of 2,780*l.* But I have one item on the other side, which makes the reduction come to 2,600*l.* My farm produced 2,600*l.* less in prices than it did in better times. This is how the 2,600*l.* is distributed: the rent is 959*l.* less to the landlord; and if I took my own land at the same rent, my rent would be 300*l.* less: making the total rent 1,259*l.* less than it was before. The tithe was 87*l.* less: the income tax, 42*l.* less; and I think the wages were reduced—this is an estimate—by 350*l.*; the blacksmith and carpenter were paid 25*l.* less; and the rates are a little lower, 20*l.* less. That leaves a balance out of my pocket of 817*l.* less after these reductions in rent and other things. That is my estimate.

Low prices.

35,871. Have you derived any benefit from the low price of manures and feeding stuffs that you have bought?—Everything sells for rather less.

35,872. But about the other things that you purchase, have you not derived benefit from them?—Yes, they cost less, but what we sell makes less.

35,873. But have you derived any benefit from the low price of manures and feeding stuffs, and so forth?—Some little benefit from the feeding stuffs.

35,874. Have you taken that into account?—Yes; I have taken nothing for the oats and things of that sort consumed on the farm; I have taken no account of them.

Condition of farmers.

35,875. What is the condition generally of the farmers in your neighbourhood?—Everybody is losing money.

35,876. Have you been over many of the farms yourself?—Yes, over a good many farms. Before harvest—that was when I went over them—I never saw the country look so well as this year, but the harvest is threshing out very unsatisfactory.

35,877. I think you are a very large valuer as well as a farmer?—I am a valuer, but not a very large one.

Mr. R. J. Epton.
23 Nov. 1894.

Letting.

35,878. Are there any farms unlet?—There are a few unlet, but none uncultivated; it is all in cultivation. I do not know a farm in Lincolnshire that is not in cultivation, and the farms are let where the landlords will take a fair rent.

35,879. Will the land let at a fair rent?—Yes, there are plenty of tenants to be had now.

35,880. How do you account for that?—I do not know. It is the only business there is in Lincolnshire, and a man must either farm or do nothing.

35,881. But still one would think if things were so bad that people would be unwilling to put capital into farms?—As a matter of fact there are people who are willing.

35,882. Are there men of capital ready to go into farms?—Yes, on a good farm; good farms get let.

Condition of farmers.

35,883. Are there any farmers doing well?—I think not.

35,884. Do you observe any difference in the different classes of farms?—Yes.

Large and small farms.

35,885. Are the smaller farms doing better than the large ones?—No, I think not; I think the small farmers are quite as depressed as the large farmers. There is here and there one; you do see men that do well, a good deal better than their neighbours; but, as a general rule, the small farmers are as badly off as the large farmers, particularly if they have bought their land: then they are worse off.

Deterioration in farming.

35,886. In spite of the depression, the land has been maintained in a good state of cultivation, you think?—Yes.

35,887. And the land is free from weeds?—Yes, I think it is.

35,888. I suppose the dry season of 1893 did good to the land?—Yes, it made it much cleaner, I think. Some of the clay land in 1893 did not get sown with corn, and it got an extra cleaning.

35,889. Are you a member of the Lincolnshire Agricultural Society?—Yes.

Burdens on land.

35,890. I believe they have passed a resolution which you can lay before us?—They passed a resolution on the 13th April, I was not present at the time. That resolution is as follows:—"Resolved, that in the opinion "of this meeting, land for the purposes of agriculture "should be freed from taxation, except for purely local "requirements, and to raise the necessary funds for "this without placing any burden on other interests, "a registration fee of 2½ per cent. (ad valorem) on all "importations to the United Kingdom be advocated: "and that there should be a further fee of 2½ per cent. "upon all such things as are in competition with "British manufacturers and producers in our markets."

35,891. What do they mean by saying "freed from "taxation except for purely local requirements"?—I do not know. I was not present. I only see what passed.

35,892. Does that represent your own view—I only want to know what the project is?—The land pays a deal more than its fair share of taxation; that is what it means, I suppose.

Rates.

35,893. What are the rates on your farm, how much in the pound?—I cannot answer the question straight off.

35,894. I think you said there was a saving on the rates?—There has been a slight saving, but very slight.

35,895. About 20*l.*?—Yes.

35,896. Have you got the figures showing what they were and what they are now?—No, I have not.

35,897. Perhaps you could add that to your evidence when you come to correct it?—Yes. I could give the figures for the parish, but not for the farm.

35,898. Can you give us what it is in the pound?—The poor rate in the parish has been 10*d.* in the pound, and the highway rate 8*d.* during the last two years.

35,899. Does the poor rate include the county rate?—Yes.

35,900. Is that 1*s.* 6*d.* all that you have to pay; does that include all?—Yes; there is a voluntary school rate and a voluntary church rate.

35,901. But that is voluntary?—Yes.

Mr. R. J. Epton.
23 Nov. 1894.

35,902. All that is obligatory is 10*d.* for the poor rate and 8*d.* for the highway rate, making 1*s.* 6*d.*?—Yes.

35,903. Has that been less than it was a few years ago?—Yes.

35,904. What was it a few years ago?—The poor rate was about 1*s.* 2*d.* in the pound, and the highway rate about 10*d.*; but a portion of the highway rate was put on to the main roads and paid by the county, making a reduction of from 10*d.* to 8*d.*

35,905. So that the rates were reduced from 2*s.* in the £ to 1*s.* 6*d.*?—That is about it.

35,906. Have you yourself had the benefit of the reduced assessment?—Yes.

35,907. Is your land now assessed at 1,900*l.* instead of 2,900*l.*?—Not so much difference as that. I believe it was reduced 15 per cent.

35,908. Do you know what the assessment of your farm is now?—No; I do not.

35,909. Perhaps you will add that to your evidence and say what it was 15 years ago before the reduction was made?—Yes. (*The witness subsequently wrote to say that he was unable to supply the figures.*)

Assessments.

35,910. Should you say that generally the farmers have had their assessments reduced in proportion to the reduction of their own rent?—They have in our union, but not quite so much. There is a uniform reduction on agricultural land of 15 per cent. throughout the union.

35,911. But the reduction of rent has been more than that?—In some cases a good deal more.

Reductions of rent.

35,912. Taking the average, what has been the reduction of rent in your own union?—I should think the average throughout the county has been 30 per cent.

35,913. But in your union how much was it reduced—as much as 30 per cent?—Yes.

35,914. And the reduction of the assessments is not more than 15 per cent.?—I think not. There are individual cases which have been further reduced.

35,915. (*Mr. Little.*) Your own rent has been reduced 35 per cent.?—Yes, perhaps so.

35,916. (*Chairman.*) What is your own union?—Spilsby.

35,917. I see from the return in my hand that the total assessment on land has been reduced from 186,000*l.* to 140,000*l.*; that is to say, 46,000*l.*, which is about 25 per cent., I should say?—I am not a guardian, and I do not know anything about that.

35,918. At all events the farmers have had a reduction in their assessments and a reduction in the amount of their rents?—Yes.

Rates.

35,919. And the rates are now 1*s.* 6*d.* in the £, instead of 2*s.*?—Yes, that is in our parish.

35,920. What do you think should be done in the matter of rating? Have you any proposal to make?—No, I have not.

35,921. Then you do not make any serious complaint about the amount of the rates?—It is all charged on the land, and we feel that it is a grievance that professional men do not pay their share.

35,922. I only want to know what your view is. Have you any proposal or recommendation to make to the Commission?—No, I should not presume to do that.

35,923. It is advisable that we should know whether the rate of 1*s.* 6*d.* in the £ is so high that you would require relief?—It is a great question altogether.

35,924. As a valuer valuing a farm you take into account the rates of course?—The rates are all the same about the union.

35,925. In valuing what the rent of a farm should be you do take into account the rates?—Yes, of course.

35,926. Therefore ultimately some people say it falls upon the landowner?—So it does if you put it in that light.

35,927. What recommendations have you to make? You have given us the resolution of the Agricultural Society of Lincolnshire, but apparently you were not present, and I do not know that you altogether agree with it?—Yes, I do agree with it.

Mr. R. J. Epton. 23 Nov. 1894.

35,928. What do you specially recommend yourself?—I should recommend that you charge the foreigner the same as we pay.

Protection.

35,929. Do you mean to put a duty on imports?—To put a duty on imports.

Quality of labour.

35,930. (*Sir Nigel Kingscote.*) As regards your labour, I wish to know whether the labour you get now is as good as it was 10 or 20 years ago; do you think the men work as well as they did?—Yes. You have men of all sorts, good men, and bad men, and indifferent men, but I think that the average man is as good as he was at any time.

Low prices.

35,931. (*Mr. Whitehead*). You say that tenant farmers cannot be expected to go on unless they get some very sensible relief. In what direction do you think that relief should take place?—Higher prices is the only relief I can see.

35,932. Can you say how you are to obtain those higher prices?—No, I cannot.

35,933. You have no proposition to make for raising prices?—No.

35,934. Would a decrease in rent give sensible relief?—That gives relief to the men who pay rent, but it wants more than that.

35,935. More than a decrease of rent?—Yes, because the men who are farming their own land are as badly off as the tenants.

Dairying.

35,936. Is dairy farming adopted at all in your county?—Not at all.

35,937. Could it be adopted in your county; are the climate and soil and other circumstances suitable?—I can only say that it has never been tried to any great extent. We cannot get a market for our produce, not for the milk at all events.

35,938. You could not get a market for the produce?—Not for the milk.

35,939. And milk now is the most important part of the dairy industry?—I think so, as far as I know.

35,940. You are prevented from adopting it in Lincolnshire from the want of markets?—Yes; the railway facilities are not good. If the whole county was made into a dairy county the railway company would bring itself into form, but at present if we want to send milk into London it is a day's work getting it there and the railway charges are very high.

Protection.

35,941. (*Mr. Giffen.*) You do not expect those prices to be raised by this five per cent. duty upon the importation of foreign produce?—No, that would not raise the prices much.

35,942. That is not your recommendation for remedying agricultural depression?—No.

35,943. It would not benefit agricultural land, would it?—It would benefit proportionately to the increased prices.

35,944. Not very much?—If that money was used to keep down our rates it would be a further benefit according to this resolution.

Burdens on land.

35,945. (*Mr. Little.*) You gave us some figures showing the reduction in the value of your produce. Can you give us the total value of produce in the earlier period for comparison? What was the value of the whole produce?—I cannot give that figure now.

35,946. You have a large number of farmers in your neighbourhood who own their land?—Yes.

35,947. And there the question of rates is not one between occupier and owner—it is a charge upon the land?—The rates are put on land.

35,948. I mean to say that the man who occupies his own land cannot throw his rate upon anyone else, as the tenant does upon the landlord?—No.

35,949. It has to come out of the produce—out of the land?—It has, anyhow.

Occupying owners.

35,950. Do you find that those who have bought their farms are better off than those who hire them?—No, they are a great deal worse off, because the mortgagee does not reduce the interest the same as the landlord does the rent.

35,951. Would it, in your opinion, be any remedy for the present agricultural depression that farmers should have greater facilities for buying their farms?—No, that would not make it any better.

Mr. R. J. Epton. 23 Nov. 1894.

35,952. You do not think that they would have any better security?—No. At the present time there is nobody to buy land. If we could find customers for land we should be better off.

Small holdings.

35,953. But you have a large number of small owners in the neighbourhood of Wainfleet?—Yes, a large number.

35,954. They have bought their land, have they succeeded by doing so?—No, a great number of them are ruined, simply because the interest is more than the land is worth now.

35,955. The value of the land has gone down so much that the purchaser has lost his part of the property, and what is left is the property of the mortgagee entirely?—Yes.

Agricultural Holdings Act.

35,956. You have had a good deal of experience of the working of the Agricultural Holdings Act?—Yes.

35,957. That is to say in valuing under your custom?—Yes.

35,958. You do not actually go under the Act, do you?—It is very often excluded, nearly always, but it is getting more and more into vogue.

The Lincolnshire custom.

35,959. How do you exclude it?—By agreement between the landlord and tenant.

35,960. But can such an agreement be made?—The agreements are all made specifying what is to be the substituted compensation.

35,961. Are those usually adopted in Lincolnshire?—Very generally so, and they were in force long before the Act.

35,962. Does the outgoing tenant have to give notice of his intention to claim?—If the Act is put in force; but that is very seldom done in Lincolnshire.

35,963. But under those agreements do they give notice?—No.

35,964. Your procedure is more simple than under the Act?—Yes.

35,965. Do you see any necessity for giving notice two months before?—No, it is much too long; it puts everything out of order altogether.

35,966. As a valuer accustomed to value in a county where there is a good custom, you do not think a notice of the kind is required?—Not so long beforehand.

35,967. How long would you say?—It need not to be given many days beforehand.

35,968. Is it usual where a claim is made under an agreement for a counterclaim to be made by the landlord for dilapidations if there are any?—Under our system the counterclaim is not made, but the dilapidations are taken into account.

35,969. But no formal claim is made?—No formal claim is made. The agreement always specifies that the landlord should be——

35,970. You are in the habit of awarding compensation where there is a fair ground for the landlord's claim for dilapidations?—Yes.

Condition of farmers in Lincolnshire.

35,971. (*Mr. Chaplin.*) Everybody is losing money in agriculture in Lincolnshire?—I think so. There is no exception to the rule.

35,972. Since what date did the change in the county begin from good times to bad—how long has this process of losing money been going on?—1874 was the last good year, and it has been growing worse and worse ever since, with variations.

35,973. With regard to the farmers who cultivate their own land, how did they, as a rule, become possessed of it? Was it bought out of money saved from the farms that they held as tenants?—It is a question that I can hardly answer.

35,974. But there are a good many who have bought farms?—Yes, because they could not take farms; there was such a demand that they could not take farms, and they bought them.

Occupying owners.

35,975. There are a good many men in Lincolnshire owning land which they farm themselves?—A good many.

35,976. And how long have their farms, as a rule, been in their possession? It does not date back a very great number of years, does it?—I could not answer that.

35,977. What I want to arrive at is this: did they or did they not begin as tenant farmers?—A great

Mr. R. J. Epton.

23 Nov. 1894.

number of them were tenant farmers who bought in good times.

35,978. Having held farms for a considerable period as tenants, they then bought land of their own?—Yes.

35,979. And that shows that they had done pretty well as tenants?—Yes, I should think so.

35,980. Did they succeed pretty well in this land formerly?—If they bought it 20 years ago; it has got very much reduced in value now.

35,981. But previous to 20 years ago, how did the men succeed who were farming their own land?—Up to that time they did very well.

35,982. Up till then they did very well?—Yes.

35,983. There was no trouble about the interest to be paid to the mortgagees?—No.

35,984. It is only since the date of the bad times that these men who have had farms of their own have done so badly?—That is it.

Cause of depression.

35,985. And you attribute this to the fall in the prices of produce which has taken place since then?—That is entirely it.

35,986. Now, with regard to Lincolnshire, generally the farming used to be of a very high-class character, did it not?—Yes, it was.

Deterioration in farming.

35,987. Do you consider that it is as good as it was?—The land is as well cultivated as it was, but I do not think that there is quite so much expenditure on artificial manures and such things.

35,988. Taking the country generally, from your experience of it, would you be prepared to say that the farming is continued now at the high standard of excellence that it used to be, generally?—I do not think it is quite. Some farmers have fallen off a good deal, but others have done as well as before.

35,989. If they continue to lose money at it, I suppose you do not expect that this good farming will continue much longer?—I do not know how they can go on. I cannot make my farm pay its way, and I do not think that a great number of other men can either; they are only hoping for better times.

35,990. They are trying to keep their farms in good condition, and to farm the land well, in the hope of a turn and a change in prices?—That is the only thing that is keeping the thing going at all. They hope for the future which does not come.

35,991. Is your experience this: that where a man's farm is being very well done at present, it is, generally speaking, done at a loss?—That is so.

35,992. You are confident of that?—I am quite sure it is so.

35,993. You say so from your own experience as a farmer and from your knowledge and experience as a valuer of farms?—Yes.

Wages.

35,994. Now with regard to the wages, you said at the present moment they had dropped 4*s.* 6*d.* from their maximum some years ago. Are they likely to drop more if the bad times continue?—I cannot tell. I think it is very probable. I do not know.

35,995. When did the last fall occur?—A few weeks ago, after this harvest, and there are men out of work now.

35,996. There are men out of work now?—Yes.

35,997. Will the number of men out of work be increased as the winter goes on?—Yes, it is very likely.

Reduction in labour.

35,998. I suppose farmers are compelled, as far as possible, to reduce their labour bill in every way?—Yes. That is the cause of the men being out of work.

35,999. Is the labour bill the heaviest item in the outgoings and expenses of a farm?—Yes, it is.

36,000. Quite the heaviest?—Yes.

36,001. So that if they are compelled to make reductions in expenses and outgoings, the labour bill is the first thing, if possible, that they have to look to?—It is the only thing they can do. The landlords have got the rents down, and now the only thing farmers can do is, that they must get relief from the wages. They have not money to pay the wages.

Reductions in rent.

36,002. Upon that subject of the rents being down, you said that farms in Lincolnshire would let even still at a fair rent. What is your estimate of a fair rent now for a farm that 15 years ago would have been considered a good farm—a farm worth then 30*s.* an acre?—There should be a reduction of nearly one half, if not quite; it is not worth cultivating; there is only the hope to have it when the times become better.

Mr. R. J. Epton.

23 Nov. 1894.

36,003. Do you think that even the land of middling quality in Lincolnshire, with good buildings and everything else upon it, will always command 15*s.* an acre?—The bad farms are not worth anything at any price.

Difficulty in letting.

36,004. Now take the heath country which is all very wild—the heath between Lincoln and Grantham—I suppose those farms will not let at 15*s.* per acre now?—The best land will, but the worst land cannot be let. There is no fear of the tenant losing by the rent on the bad farms.

36,005. I was speaking rather from interested motives—perhaps you could find me a tenant or two at 15*s.* per acre?—You are getting some experience on that farm that I go past every week that you have in hand, and I hope you will have a good balance sheet from it.

Agricultural Holdings Act.

36,006. I think you said in answer to Mr. Little, that there was a greater tendency now to take farms under the Agricultural Holdings Act than there was formerly?—It is getting more put in force in Lincolnshire than formerly, because all the agreements are getting worn out to some extent.

36,007. When you say the agreements are worn out, what do you mean?—I mean that the farms are getting fresh tenants, and the new agreements do not exclude the Act.

36,008. Is that because the owners of the land prefer to be under the Act?—No, it is because the Act compels them to be under it.

36,009. In the absence of a substituted agreement?—In the absence of a substituted agreement the Act itself operates.

36,010. What occurred after the passing of the Act generally was this, was it not: that when the Act was passed, as a general rule in Lincolnshire, the farms were still held either under an agreement which was substituted for the Act or under the custom of the county; was that not so?—That was so.

36,011. The agreements, generally speaking, were all based upon the custom of the county?—Yes.

The Lincolnshire custom and the Tenant Right Valuers' Association.

36,012. Have you any particulars of that custom; have you any printed document which you could hand in to the Commission?—I could give you the allowances that are given on quitting.

36,013. Do you mean what you call the rules of the Tenant Right Valuers' Association?—I have a copy of the rules here.

36,014. You have it with all the particulars?—Yes. It states here that the schedule of allowances is in substitution of the Act.

36,015. Quite so?—And it was passed in 1884. In 1884 the valuers of Lincolnshire met and passed a resolution in substitution of the Act, but it was really the old thing over again.

36,016. The difference between the Act and the tenant right valuers' custom being this: that the compensation given by the Act was based entirely, I think, upon the value to the incoming tenant, was it not?—Yes.

36,017. The compensation given under the custom was based upon the actual outlay made by the tenant?—Yes.

36,018. As a rule, which have you found that the farmers prefer, the custom or the Act?—As a rule, the custom has been preferred until just lately. The custom and the Act are pretty nearly the same. The Act was based upon the Lincolnshire custom.

Valuations.

36,019. Is it not a fact that in valuing under the Act the valuers generally, as a rule, award their compensation not according to what is the value to the incoming tenant but upon a proportion of the outlay?—Yes.

36,020. Under those agreements that you speak of that were substituted for the Act, and under the custom of the country in former days, 20 years ago farmers were extremely prosperous in Lincolnshire?—Yes, they were.

36,021. So that you cannot trace any connexion between agricultural depression and any deficiencies in the compensation which they used to receive?—No

Mr. R. J. Epton.
23 Nov. 1894.

Tenant right.

36,022. You do not think that in any way agricultural depression can be said to be owing to want of proper compensation received by a tenant farmer either under the Agricultural Holdings Act, or under an agreement, or under any customs of the country?—No, I think not. From my own private opinion I do not think it is for the benefit of the farmer that he should have a large tenant right. The incoming tenant often pays more than is good for the incoming tent to pay.

36,023. It may be good for the outgoing tenant, but too heavy a tenant right is very bad for the incoming man, I suppose?—Yes.

36,024. Have there not been some alterations quite recently made by the valuers in regard to the Lincolnshire custom?—Yes.

The Lincolnshire custom.

36,025. Would you state what those are?—Under the old custom we did not allow for the corn consumed; we only made allowances for oil cakes as feeding stuffs, but not for corn and now——

36,026. Would you read out what the custom was; it is very short, is it not?—Yes. The custom for the allowance for purchased food—perhaps I ought to say at once that the straw, the manure from the straw, and the manure from straw and turnips has always gone with the holding without being paid for, and then in addition to that "for one third of the cost of linseed "cake, cotton cake, rape cake or malt culm, and one-"sixth of the cost of corn cake, malt or other "manufactured feeding stuffs of similar manurial value "which have been consumed on the farm during the "last year of the tenancy and for one sixth of the cost "of linseed cake, cotton cake, rape cake or malt culm, "and one twelfth of the cost of corn cake, malt, or "other manufactured feeding stuffs of similar manurial "value which have been consumed on the farm during "the preceding year of the tenancy." And now there has been a new resolution passed which has not been put in force yet, but which will come. "That in com-"pliance with the third part of the first schedule to "the Agricultural Holdings Act, 1883, all purchased "feeding stuffs consumed upon and not produced on "the holding be in future allowed for."

36,027. "All purchased feeding stuffs"?—Yes.

36,028. That includes corn that is purchased?—That includes corn that is purchased.

Compensation for home-grown corn.

36,029. Why is it that corn grown on the farm is excluded?—It is only because the Act excluded it; we felt that we had no power to go further in charging the landlord with corn than the Act gave us power to do.

36,030. Is it not always held that a great difficulty likely to arise is from the fraud that might be practised?—That is given as the excuse, but, in my opinion, it could easily be got over. I think that all the corn ought to be allowed the same as is purchased corn.

36,031. What is your specific against fraud?—Only that the onus of proof is on the man who eats the corn. The outgoing tenant must prove that it has been consumed.

36,032. And you, personally, although you have had no experience of its working at present, think that this might be done without fear of fraud?—Yes.

36,033. Has not that been regarded as a great danger, as a rule?—It has, and that is the reason that corn was not put in before.

36,034. But you take a rather different view from the majority of them, do I understand?—The proof must be on the man who is quitting, and I should leave him to his proof, and I think he can in many cases give satisfactory proof.

36,035. You personally have no serious apprehension that it would lead to fraud?—I think not. In my own case I made an agreement with my landlord, that he is to allow me for corn grown on the farm.

36,036. I suppose there is no difficulty in making those private agreements now-a-days?—No.

36,037. The tenant is in a position to make almost any agreement with regard to compensation that he likes, is he not?—Not quite so far as that. My landlord consulted Mr. Rawlence, and he advised that compensation should be given for the corn consumed on the holding as well as the purchased corn.

36,038. But would you go so far as to say that in the case of any tenant of intelligence in these days, he has every facility for making any reasonable and fair stipulation for himself?—Yes.

Mr. R. J. Epton.
23 Nov. 1894.

Compensation for manures.

36,039. Now with regard to the custom; compensation is also given for improvements of a more permanent character; is that not so?—There are other manures bought as well as the cake consumed. For bones the allowance is the whole cost of dry bones if used with green crops in the last year of the tenancy, and half the cost, if used during the preceding year; for artificial manures used with green crops such as the turnip crops, the whole cost of the last year has been always allowed; and for lime, it is on a seven years' principle, the seventh part to be reduced every year until the seven years have expired.

36,040. That is to say, if he left after the first year he would get six-sevenths of his outlay?—Yes. Claying and chalking is on the 12 years' principle, but that is not very much practised.

Drainage.

36,041. Is not there something given for draining?—For under-draining, yes. When the landlord finds the tiles, and the tenant the labour it is on a 10 years' principle, and where the tenant finds both the tiles and the labour it is on a 15 years' principle.

36,042. All these years they have been going on this custom, and it is working. Have you found it to be generally satisfactory or not?—Yes; I think so. It is not considered necessary under the custom to give the notice that the Act requires for the draining. If you claim under the Act, you must have got the written consent.

Notice to landlords.

34,043. Under that custom a man leaving his farm as a matter of course gets compensation for all those things, whether he has given notice to the landlord or not?—Yes; under the custom and under the agreements he does.

36,044. Do you consider there is any substantial reason or necessity for those notices being given at all to the landlord—I mean the notices which are required by the Act?—I do not know that there is any necessity; I think that it is a good thing for the landlord to know. I think that the landlord ought not to have power to exclude the man from doing it; but at the——

Compensation for improvements.

36,045. I want to know your opinion, as a practical expert and valuer, as to whether in any alterations or amendments of the Agricultural Holdings Act you would recommend any changes with regard to the notice that is to be given in asking for compensation for improvements?—I do not think there is any need of any notice, for the tenant has to drop off a fifteenth every year. We dropped that off in Lincolnshire; but the Act drops off a twentieth.

36,046. You do not attach importance to the question of notice being given?—No; I do not think that is necessary.

Cause of depression.

36,047. I gather from what you have told the Commission that you are clearly of opinion that the real cause of agricultural depression is the great fall in prices?—That is the only cause of the depression.

36,048. Have you found in your experience that since it began that fall in prices has been more or less continuous—that it has been getting lower and lower every year?—Yes; it has been gradually going lower ever since 1874; it goes by starts and jumps, but always lower.

Price of wheat.

36,049. And there seems to be no end to it?—I sold wheat last week at the lowest price I ever sold in my life.

36,050. (*Sir Nigel Kingscote.*) A good sample?—Yes; a good sample at 21*s.* 6*d.*

36,051. (*Mr. Everett.*) What weight?—504 lbs.

36,052. (*Mr. Chaplin.*) As long as that fall in price continues in this way you see no hope or prospect of permanent improvement in the agricultural situation?—Our Lincolnshire farming cannot go on with the prices as they are.

36,053. It cannot go on?—No.

36,054. Is there anything else that could take its place? Is there any change in the mode of cultivation you could suggest?—No, I think not—it would have been found out if there had. There have been all sorts of experiments tried.

36,055. There are experiments being tried now and others have been tried?—Yes.

36,056. What have they tried that you are aware of?—Growing other crops—potatoes and seeds, and varying the crops in that way, but there has been nothing beneficial done.

Mr. R. J. Eyton. 23 Nov. 1894.

36,057. Some few have tried market gardening on a large scale?—Yes, some few—I do not know how they get on, but it does not extend very much.

Market gardening.

36,058. Then it looks, I suppose, as if they were not making much of it?—Yes.

Dairying.

36,059. Have any of them tried to substitute dairy farming, either milk or cheese or butter, for the present system of cultivation in Lincolnshire?—There has been nothing of that kind done to any extent.

36,060. It has been tried by one or two I think?—I do not know of any in my immediate locality.

36,061. Is not there Mr. Lupton?—Yes, he supplies Grimsby with milk.

36,062. Does that answer?—I think it does. But you know a very small quantity from one or two farms would supply that place. There would not be an opening for another farm to help supply it.

36,063. There is no opening for a large change in that direction then?—I think not.

Effect of low prices.

36,064. Then it comes to this that if the fall of prices is to continue you are of opinion that there is really no hope for farming in Lincolnshire?—I think not—I think everybody will be knocked out.

Sale of straw.

36,065. (*Mr. Dalton.*) Are you allowed to sell the straw off your farm?—I have no clause in my agreement to prevent me.

36,066. Do you sell any of it?—No, I have not sold any of it—it is not worth selling—the price to-day is 12*s.* 6*d.* to 15*s.* delivered at the railway station. Last year it was dearer, but I had not any to spare.

36,067. Have any of the farmers in your neighbourhood sold their straw at all?—They did last year.

36,068. And did that at all compensate them for the bad price of the corn? What effect would it make; what was the value of straw per acre when it was sold last year?—Some of them made 2*l.* 10*s.* per acre last year; this year it is only about 15*s.*

36,069. Last year when it was 2*l.* 10*s.* per acre, that must have made a considerable difference in the value of the crop?—I am only speaking of the few in the Fen who had a quantity of straw.

36,070. But it has made no difference whatever to yourself?—No, none to me.

Pauperism.

36,071. To what do you attribute the fall in the rates from 2*s.* to 1*s.* 6*d.*? I suppose to a great extent to the Parliamentary grants that the local authorities have had?—That had something to do with it, a great deal, I believe, and there is less pauperism as well, I think, in the Spilsby Union. I am not a guardian, but some years ago the guardians gave up giving out relief and it very much reduced the rates.

Rates.

36,072. And your highway rate is reduced?—That is accounted for by two or three miles of main road being taken over by the county.

36,073. And you have not found that the county council rates have risen to any extent?—That has been met by the Parliamentary grant to some extent.

Occupying owners.

36,074. (*Mr. Lambert.*) You said just now that owners of land were worse off than tenants. That would only apply I presume to an owner who had a mortgage on his farm?—The occupying owner I mean.

36,075. The occupying owner who had his farm free of mortgage would be in a better position than an occupying tenant paying rent?—If he had no mortgage he would, but there are very few men in that happy position in Lincolnshire.

36,076. For what reason is it that farmers who are occupying owners have nearly all of them a mortgage on their farms?—I do not know. I suppose the reason is that they could not pay for it themselves to begin with.

36,077. So they really do not make enough to buy their farms outright?—That is so.

Demand for farms.

36,078. You said just now that formerly there was such demand for farms that men bought them in order to get into a holding?—In the good times, yes; that is not the case now.

36,079. But if such a demand existed would it not be possible that the land might have been forced up to a price beyond its reasonable value?—Perhaps that was so 20 or 30 years ago.

36,080. So you think that the tenants in Lincolnshire about 20 years ago paid more, and men who bought also paid more, than the actual value of the holding?—It proved so by the drop in prices. If prices had kept what they were then, the farms would have been worth the money.

Mr. R. J. Eyton. 23 Nov. 1894.

36,081. And they allowed no margin for the depreciation of agricultural produce?—That seems so.

36,082. Because there was such a demand that they had a difficulty in getting farms at all?—That is so to some extent.

Reductions in rent.

36,083. The reductions of rent upon your own estate came to about 35 per cent., I believe?—Yes.

36,084. How much has the produce of your estate depreciated in value—about 3,000*l.* you have it in your brief?—When I got the figures it was shown to be 2,600*l.* really.

Profits of farming.

36,085. How do you manage to keep on when your total income is 2,600*l.* a year less than it was 20 years ago, and yet for all that you pay only 1,000*l.* a year less rent? How do you manage to keep on—are you at too little rent?—All my profit is gone, and I am losing money besides.

36,086. Even losing money now?—Yes.

36,087. Supposing the price of corn does not rise, what will be your ultimate remedy?—I shall have to give over growing corn or anything, and the country will go out of cultivation.

Reduction of rent.

36,088. Will it go out of cultivation with the rent of 1,900*l.* that you are now paying? Presuming that that rent were reduced by another 30 per cent., would the land then go out of cultivation?—The 30 per cent. off that would not cover the loss; and the landlord now pays 700*l.* a year out of the rent.

36,089. Yes, that is a landlord's charge, but I am talking more particularly of tenant farming and land going out of cultivation?—My farm is a very good farm.

36,090. Do you imagine that tenant farmers can go on losing money? Is it fair that they should occupy the farm and lose money and pay a large per-centage of rent?—They cannot do it.

36,091. If prices do not rise your ultimate remedy will be a reduction of rent?—That is so.

36,092. And you think that rents are not quite reduced enough to meet the altered condition of things?—The tenants are losing a deal more than the landlords now.

36,093. And they would be less able to lose money than the land owners?—Yes.

36,094. So you think that the tenant is in a much worse position than the landlord?—Yes; but the tenant can give up at a year's notice and get rid of it.

36,095. Why does not he do it?—He is hoping for better times. He has never been used to any other business and he must go on hoping for better times, or retire altogether.

36,096. If he has to give up his farm, for which he is paying an exorbitant rent, he is unfit for any other business?—That is the reason that they are hanging on, a great number of them.

36,097. And a man leaving his farm is at a great disadvantage?—Yes.

36,098. What makes you keep on hoping against hope that prices are going to rise?—I do not know; what has been will be.

Low prices.

36,099. Have you had any discussions at the Chamber of Agriculture, or have you had any ideas brought before you that prices in the future will be more remunerative than they have been in the last 20 years?—We have had no intimation before that it was going to be so low.

36,100. When you meet at your Chamber of Agriculture you mutually hope that it will be better?—I suppose that is it, the average is very much below what it was.

36,101. And that is the reason that you have not asked for a further reduction of rent?—That is one reason.

Compensation for home-grown corn.

36,102. How many tenants in Lincolnshire get compensation for their own home-grown corn?—None up to now.

36,103. Except yourself?—No; and mine only on quitting.

36,104. You think it is proper compensation to give?—I think so. The manurial value of the home-grown corn is just as good as the purchased corn.

36,105. But you said that a tenant of intelligence could make a fair bargain for himself?—Yes; but there are two to a bargain.

36,106. But if the farmers have not made a fair bargain to secure for themselves compensation for home-grown corn, then, of course, they either have not a fair bargain, or they are not men of intelligence?—Home-grown corn never has been brought up for compensation in Lincolnshire, and there has always been some consumed by the horses, at all events.

Cattle breeding.

36,107. How many cattle do you keep on your holding?—I keep about 200 head of beasts. I breed about 60 calves a year, but altogether about 200 beasts.

36,108. Do you imagine you could further extend that keeping of cattle?—No, I keep as many as are profitable.

36,109. How do you arrange your grass? Have you grass land down after corn?—Yes.

36,110. How long do you let it lie?—One year.

36,111. Do you think it possible to let it lie two years—I am speaking from my experience in another part of the world?—It would be possible, but we find it more profitable to put it down for one year.

36,112. Into wheat?—Yes, and it goes to turnips.

36,113. Would not you keep more stock if you let your land lie for one or two years?—Yes.

36,114. And do you not think you will have to look somewhat in that direction for an alteration in your system, if the present prices of corn and stock continue to fall?—Yes, on land not suitable for turnips. But the turnip land makes it more profitable to get it on the four-field system.

36,115. (*Mr. Everett.*) With regard to the question put to you on stock, is it not a fact that arable land on the four-course system will keep more stock than the same land would in pasture?—That is so; it would keep more sheep and beasts on the four-course system than on pasture.

36,116. And grow all the corn in addition?—Yes.

Price of wheat.

36,117. With regard to the high rents and the high purchase value of land which it was at one time, I think I should be right in saying that that was founded on prices which had remained stable for something like a quarter of a century—the price of produce, if anything, had tended to increase; that is, the whole produce of the farm in the years from 1853 to 1878 had continued stable, with rather a tendency to increase than to decrease?—Yes, I believe the price of wheat 40 years before the Tithe Act, and 40 years after the Tithe Act, averaged 56*s.* per quarter for 80 years, and now it is 19*s.* per quarter.

36,118. The farmers who bought their land 20 years ago bought it on the experience of the previous quarter of a century?—Yes.

36,119. And they thought that prices might be expected to continue as they had been stable?—Yes, and that is the reason that men are hanging on now.

36,120. Have you any idea why it is that during the last 20 years prices instead of remaining stable have been continually falling? Have you formed any opinion of the cause of that?—No, that is beyond me, I think.

Rents in 1869.

36,121. (*Mr. Elton.*) Can you tell us whether any great rise in rents took place about 1869, or about that time, in Lincolnshire?—There was a rise about that time.

36,122. I do not mean in your case, but generally throughout your neighbourhood?—Yes, there was.

36,123. Was there a great rise?—There was a rise about that time. They were anxious for farms and there were more buyers than sellers.

36,124. Was the rise as much as 20 per cent.?—Not so much.

36,125. That is all gone?—And more than gone.

Comparative losses of landlord and tenant.

36,126. You said just now that the farmers had lost much more than the landlords, but I did not quite follow your meaning. When you say a landlord loses, do you mean from the rent that was fixed?—I mean the annual loss of the tenant is more than the annual loss of the landlord. Of course his capital loss is much greater.

36,127. The tenant loses money which he puts into the land—the interest of it, and a part of the capital?—Yes.

36,128. That is not quite the same sort of loss that the landlord has?—If the landlord's loss is one-third of his rent, the tenant's loss is more than the rent.

36,129. The promise of the rent—he loses what he expected to get, and the farmer loses what he spends?—Yes.

Wages.

36,130. You told Mr. Chaplin that there was a fall of 4*s.* 6*d.* from the maximum wage?—Yes, for the winter wage.

36,131. Since when did that drop take place?—The high wages time would be from 1872 to 1874.

36,132. I only want to know with clearness; in each case are you speaking of the ordinary class of labourer whom you mentioned?—Yes.

36,133. That is to say that the same class of man in the prosperous times would have got 4*s.* 6*d.* more than he gets even in the present month?—Yes.

36,134. Do you use foreign barley for feeding?—No, I have plenty of inferior barley of my own without paying for foreign barley.

Low prices.

36,135. You did not make it clear to me when the Chairman asked about the prices of manures and feeding stuffs, whether you considered that the benefit you got from the fall in prices was a large amount as compared with your losses. Do you find great benefit from the increased cheapness of manures and feeding stuffs?—The feeding stuffs have reduced in some degree, the same as the corn, and at present our corn is cheaper than any feeding stuffs.

36,136. You have made a deduction from the losses in the corn itself; have you made a corresponding reduction on the other side for the increased benefit that you get in buying feeding stuffs and manures?—Yes.

36,137. It is only a question of fact; did you also do that?—I did for the feeding stuffs, but not for the manures; the manures have not very much decreased.

Land laid down to grass.

36,138. (*Mr. Clay.*) You said to Mr. Lambert it would not pay in Lincolnshire to lay down into grass, even for two-year old grass?—On the heath land we find, and all the tenant farmers find, that it is more profitable to go on the regular four years' system.

36,139. But you have told us that you have had no profit in arable land farming?—There has been little.

36,140. Well, there could not be the same expense on grass land, and if you converted a part into grass there would be no great loss then, because there would be no great labour upon it?—That is so. On the poor land that has and will come more into vogue for two or three years, but it is not the custom and it is not the fashion in Lincolnshire to lay it down for three years.

36,141. The farmers in Lincolnshire have been acting too much with a bygone custom, and in not adopting the grass principle; when wheat, and oats, and other cereals are so cheap they have made a mistake?—We have been working unprofitably, but as one of the Commissioners said just now, the arable land keeps more stock than the grass land would. We keep more stock on the four-course shift than if it were left as seed land.

36,142. You cannot keep as much stock on the four-course shift as a five-course shift?—I believe we did; the turnips and the straw keep so much more than the seeds.

36,143. You have two classes of land, you have two rotations of grass crop?—No, one turnips; turnips every fourth year and seeds every fourth year.

36,144. But with a five years' shift in a 500-acre farm you would have 200 acres of grass, whereas in the four-course shift you would only have 125 acres?—Yes.

36,145. And this 75 acres with the five-course shift, you would not only save the expense, but you would rest the land?—Yes.

36,146. And condition your land; most land is conditioned by the free use of cake, and would not Lincolnshire be benefited with two-year-old grass?—Perhaps so, there is something to recommend it.

36,147. Would not the five-course shift at the present time, when corn is so cheap, keep more stock and be more advantageous to the Lincolnshire farmers, and save expense?—Perhaps it would.

Rent.

36,148. (*Chairman.*) I think you said that until a few years ago you were paying rent at the rate of 50*s.* an acre?—Nearly so.

36,149. Had that been considerably increased within your recollection?—No, it was the same many years before that.

36,150. Was that the general average rent of the district?—No, my farm is very much above the average.

36,151. What was the general average of the district at that time?—It happens that my farm is very good land; it is near the sea, and it is above the average quality.

36,152. What was about the average, in the good times, of the land in your district, the Wainfleet district?—The land varies so much I could not answer that question; an adjoining farm might be double the rent.

36,153. It was 50*s.* and now it is 30*s.* per acre?—That is about it.

Profits of farming.

36,154. On the balance of your account you have lost about 800*l.* during the last two years?—Yes.

36,155. You are paying 30*s.* per acre, and a rent of 1,900*l.* a year; there is a considerable margin out of which that 800*l.* could come?—The landlord has many payments to make out of his rent.

36,156. What you have to look at is as to what money you pay for the rent; you are paying 30*s.* per acre?—Yes.

36,157. And your losses for those two years were 800*l.* a year?—But the landlord's receipts are less than 1*l.* per acre.

36,158. But that is from other circumstances, from the tithe being high, and from having encumbered his estate for the purpose of making improvements?—Yes.

36,159. He receives from you at the rate of 30*s.* per acre, or 1,900*l.* a year?—Yes; and 10*s.* an acre of that he has to pay, that he must pay.

Wages.

36,160. You have reduced the labourers' wages, and you have made a saving in that way of 350*l.*?—About that.

36,161. I suppose if the rent had been reduced by that amount you might have maintained the rate of wages for your labourers?—My 800*l.* is lost still.

36,162. I am now thinking of the labourers' wages; you have reduced your labourers' wages by 4*s.* a week, and you have effected an economy in that way of 350*l.* What I was asking was this: If you reduce the rent by that amount, whether you could not have maintained the wages of your labourers?—The wages all through the county are reduced in the same proportion as my own. If I was paying 4*s.* per week more than anybody else I should not——

36,163. Generally speaking, with the same reduction of rent the wages might have been maintained?—I am farming a farm of my own on which there is no rent, and I had to reduce the wages there.

36,164. I am now talking of the tenant farmers, and I am pointing out that your rent of 30*s.* per acre is a high one?—Yes, it is.

36,165. Now I presume the price of wheat this year may be considered exceptional?—Yes. I have not made any calculations this year.

Reductions in rent.

36,166. But supposing the price goes back to the average of the last four or five years, something from 26*s.* a quarter, could you then cultivate your farm to advantage?—No, I could not; that is, the year that I have taken into consideration shows 800*l.* loss.

36,167. Will not that involve a considerable reduction of rent?—It will. If it goes on I shall not farm it myself.

36,168. Will it not result in a reduction of rent?—It will; it will result in there being no rent and no wages.

36,169. And apparently the loss is 800*l.* and the rent is 1,900*l.*?—Yes, but the landlord only gets 1,100*l.* and something.

36,170. But that is in consequence of what I ventured to point out, the tithe and other charges on the estate?—Yes.

Mr. R. J. Epton. 23 Nov. 1894.

36,171. But we must look at it from the tenant farmers' point of view, who has to give the rent. What becomes of the rent is another matter; but the rent of 30*s.* an acre seems a very high one?—Yes.

36,172. And regrettable perhaps as it may be it still affords an opportunity of a considerable reduction?—Yes, but what I meant to point out is that the landlord only gets 1,200*l.*, and I am losing 800*l.*, and there is only that margin for the land and the stock and everything about it.

36,173. (*Mr. Chaplin.*) Your farm is an unusually good one?—Yes.

36,174. If it was necessary to reduce the farm by the amount of the rent, as the chairman suggests, that would mean in the case of the worst lands, which are by far the greatest quantity, there would be no rent at all?—Yes.

36,175. And they would go out of cultivation and there would be no wages and no employment at all?—And a great deal of that will go out of cultivation without anything.

36,176. (*Mr. Little.*) The chairman has asked you about a reduction of rent and the reduction of wages, but whether the rent is high or low has no effect upon the wages, has it?—No.

36,177. You only pay what you are obliged to pay?—Yes, by the higgling of the market.

36,178. And the labourer gets as much as he can?—Yes.

36,179. Independently of whether you pay any rent or no rent?—Yes. In the summer time we get more men from Ireland, but they will not come at the low wages in winter.

36,180. (*Mr. Chaplin.*) You employ them for harvest?—Yes, in the summer.

Land laid down to grass.

36,181. (*Mr. Everett.*) With regard to the question of the difficulty as to keeping down grass for two years, you were asked if that would not have the effect of improving the condition of the land, would it not also increase the spear grass in it, the twitch or the couch?—On the lighter land it fills up full of twitch, and that is the reason you do not bring it into cultivation.

36,182. If you leave it down one or two years it would foul it very much?—It takes a good deal of working on it. Some lands will stand it and more will not.

36,183. And in regard to the land you spoke of, which seems to be good land, if grass seeds were sown on it and it were let lie, what rent would it bring in to the land owner?—There would be two or three good years and then a lot of very bad years on the newly laid down grass.

36,184. Would it not bring in more to the landlord than the rent which would remain to him if he reduced your rent another 800*l.*; would not he then find that it would bring him in more to have grass sown on it and abandon the cultivation of it than to let to a tenant to keep it under the plough?—I do not know; I cannot answer that question.

36,185. Naturally a man who owns a farm wants to get something out of it; and if he can get more out of it by abandoning cultivation and leaving it to grass, then the labour and the wages will disappear altogether?—Yes.

Tithe.

36,186. (*Mr. Dalton.*) Can you tell me what the tithe is per acre?—355*l.* on 1,230 acres.

36,187. Is that higher or lower than the average?—I think it is higher than the average in the neighbourhood.

36,188. But you have a heavy tithe?—Some parishes have a heavy tithe, and the next none.

36,189. Is it redeemed?—No; it is glebe land.

The witness withdrew.

Mr. J. Pears. 23 Nov. 1894.

Mr. John Pears called and examined.

36,190. (*Chairman.*) You are a tenant farmer residing in Lincolnshire, I believe?—Yes.

36,191. You farm 630 acres of your own land and 230 acres of the Waddington glebe?—Yes.

36,192. Whereabouts in Lincolnshire is it?—It is about five miles south of Lincoln-on-the-Heath.

36,193. In what union?—In Lincoln Union.

Rent of witness's farm.

36,194. What was the rent of the glebe when you first took it?—1*l.* an acre. I have had it five or six years. I have a note here from the landlord, who offered the farm to me about 10 years ago; in this note he says he used to let it at 45*s.*

36,195. The rent formerly was 45*s.*?—Yes. He is the Rev. Archdeacon Ferry.

36,196. It is now 1*l.* an acre?—Yes.

Characteristics of farming.

36,197. What is your farm—a sheep farm?—Yes; arable land, nearly all of it.

36,198. You grow no wheat, but all barley, on your farm?—Yes; barley, but no wheat.

36,199. Is it mainly an arable farm, or is it a pasture farm?—The glebe is all arable.

36,200. You have bred and reared a large number of rams which, owing to foreign demands, have been fairly profitable?—Yes; they have been fairly so.

Condition of farmers.

36,201. In the main you have not done badly in your farm in the last few years, is that so?—This is the worst year I have known.

36,202. Apart from this exceptional year?—Barley has done pretty well up to this year.

36,203. Taking the average of years, have you done fairly well upon your farm?—Yes, except bad years.

36,204. (*Mr. Chaplin.*) Excepting what?—Excepting what I call dry seasons—1887 and years of that sort.

36,205. (*Chairman.*) This year has been very bad?—Yes.

36,206. What is the reason of that?—The barley being bad.

36,207. Bad weather during harvest time?—I think so; and it ripened badly.

36,208. Did the bad weather damage the barley very much?—It stained it; it is of bad quality.

36,209. The result of that coupled with the low price, is that this is a bad year?—Yes.

Cost of labour.

36,210. Is labour as costly as it was in former years?—We are giving less per day now.

36,211. What are the wages?—2*s.* 3*d.* per day now; 13*s.* 6*d.* a week.

36,212. What were they?—They once got up to 3*s.* I must explain that I live rather near Lincoln, and our best men go to Lincoln, and so we are obliged to keep rather higher than they are Mr. Epton's way.

36,213. Do you keep a few cattle in the winter?—Yes.

36,214. Do you also keep dairy cows?—I have about 20 dairy cows.

36,215. Would you say that your total labour bill has rather increased than not?—I think it has.

36,216. In spite of the reduction in wages?—I think so.

36,217. When was this reduction made?—Only this autumn. We paid half-a-crown last year.

36,218. Up till now the wages have been maintained?—Yes; the last few years they have been the same.

Foreign competition.

36,219. What do you attribute the low prices to?—To the quantity of import of foreign corn, I do myself.

36,220. I believe you come here as the representative of the Lincolnshire Chamber of Agriculture?—I do.

Protection.

36,221. What recommendations have they to make?—They suggested at a meeting that there should be a moderate import duty, but I believe that is a registration fee really and not an import duty, and that we should be relieved from the taxes.

36,222. You recommend a registration fee on all importations?—Yes.

36,223. That, in fact, would be an import duty, I suppose?—I suppose it was a moderate one—something of the rate of 1*s.* a quarter, as we had before; I believe that was the meaning.

36,224. Out of the fund so raised you would give relief to agriculture for their rating, I suppose; is that the idea?—That is it.

Rates.

36,225. What are your own rates now?—Mine on my own farm are 2*s.* 2*d.* in the £. My own farm is assessed at 26*s.* an acre.

36,226. Has the assessment been reduced?—Yes.

36,227. What has it been reduced from?—I think from 36*s.*

36,228. When was the reduction made?—I think it began about 12 years since.

36,229. Has the rate in the pound been maintained, or has it been lowered?—No, it is quite as high; the poor rate is quite as high as ever. I suppose that is owing to Lincoln; Lincoln is in the same union.

36,230. Do you get any advantage from the neighbourhood of Lincoln in your farm?—Excepting that it is nearer for the delivery of corn; that is all.

36,231. Not for dairy produce?—Very little.

36,232. What other recommendations have you to make yourself?—I am sure I do not know. I think the poor law will become much heavier to us.

Condition of farmers.

36,233. What is the condition of your neighbours?—Do you mean the farmers?

36,234. Yes?—I think just in my own neighbourhood the farmers have done pretty well; there are some who have not done so well.

36,235. In your own neighbourhood you think they have farmed pretty well?—I think they have done pretty well up to this time.

36,236. But this year has been a very bad one for them?—Yes.

36,237. Taking the average of the last few years they have done very well?—I do not think anyone has made any money; I should not say anyone has.

36,238. What do you mean? You said they had done fairly well?—I meant as compared with other districts.

Reductions of rent.

36,239. Have rents been lowered there?—Very much. This glebe farm of mine was 45*s.* an acre; it is now 1*l.* I know another that was 37*s.* 6*d.*, but which is now 12*s.*

36,240. What should you say has been the average reduction in your neighbourhood?—I am not in a position to say. I do not know of many. I am only giving one or two I do know. I know one which my brother-in-law took at 48*s.*, and I believe it is now a little more than 1*l.*

Sheep breeding.

36,241. (*Mr. Little.*) You have said, I think, that you are a considerable sheep farmer, but you are something more, are you not; you are a prize taker for sheep?—I took some prizes.

36,242. You have frequently taken prizes for Lincolnshire sheep?—Yes, I have.

36,243. And you have had a considerable sale for rams at different times in previous years?—Yes.

36,244. You have had something more than the usual opportunities of farmers of making high prices?—If I had not I should not have farmed, I should have given up farming.

36,245. What I want to get on the notes is that you have had exceptional opportunities of making money?—Yes.

36,246. From having a superior flock which has taken prizes at a great many shows you have had a demand for your Lincoln rams?—Yes.

36,247. The principal part of your occupation has been land that you own?—Nearly all of it; at least nearly all of what I have now.

36,248. And therefore the question with you has not been that of a reduction of rent?—No; I wish it had not been my own.

36,249. Many questions which were asked of the previous witness, and which perhaps you heard, would not apply in your case at all?—No.

Occupying owners.

Profits of farming.

36,250. Your being the owner has not saved you from loss, has it?—No, certainly not.

36,251. Would you say then that you have found the business of farming profitable the last 10 years?—Certainly not.

36,252. Have you actually lost money?—I have some years certainly.

36,253. (*Chairman.*) Taking the average of years, I thought you said till this year you have not done badly?—I have lost money; there is no doubt about it.

36,254. (*Mr. Little.*) You have lost money as a farmer?—As a farmer.

36,255. Counting your rent at what other people would give for your farm?—Yes.

36,256. Have you lost as an owner as well if you had to realise?—Certainly more than half.

Value of land.

36,257. If your farm were put into the market and had to be sold it would make considerably less than it would have made 10 years ago, and very much less than it would have made 20 years ago?—About half I should think.

36,258. About half?—Not so much perhaps.

36,259. When did you come into possession of this farm?—In 1881, when my father died.

36,260. But your father was the owner before?—He bought it in 1854.

36,261. Is it in the parish of Waddington?—No, it is in the parish of Mears.

36,262. And it is in the Union of Lincoln?—Yes.

Rates.

36,263. Do you happen to know whether the Union Chargeability Act increased the rates upon your parish of Mears?—When did that come into force?

36,264. 1865?—It did because we paid no rates at all before.

36,265. You paid no rates at all?—It was treated as extra parochial.

36,266. The consequence of the Union Chargeability Act was to make you help to maintain the paupers of Lincoln and other places?—Yes, that is it.

36,267. You have heard perhaps a theory advanced that these burdens upon land are hereditary burdens and therefore no burdens at all; have you heard that contended, that you ought not to complain of rates because there always have been rates?—There was not in this case.

Cost of labour.

36,268. That is what I want to bring out—there was no hereditary burden in your case. You cannot tell us what the aggregate amount of your labour bill is?—No I cannot for the separate farms. I have not taken it out.

36,269. You have not prepared yourself with notes as to the amount, either per acre or per annum?—No, I have not.

Highway rate.

36,270. (*Mr. Dalton.*) How were the roads maintained in your own parish before the Union Chargeability Act?—I think we had no charge at all.

36,271. You had no roads?—They were only grass lanes.

36,272. You had nothing but grass lanes?—Nothing but grass lanes at that time, and I think we paid nothing at all.

Rates.

36,273. Did you pay anything to the county rate?—We did.

36,274. What did you pay to the county rate?—I could not say exactly now; we paid the same as other parts I suppose.

36,275. You did have certain rates?—We had the county rate.

36,276. Your rates are now 2*s.* 2*d.* in the £; can you say what they were a few years back?—I think the Poor Rate was not quite so much and the Highway rate was more.

36,277. But on the whole were they about the same? Can you give the figures?—I cannot here.

36,278. But there has been no perceptible rise in them?—No, about the same I think they are.

Purchase of corn.

36,279. Do you buy more corn than you sell for the purposes of your farm?—No.

36,280. Do you sell any?—I sell the greater part of it.

36,281. What distance are you from Lincoln?—4½ miles—say four to five.

36,282. What is the population of your parish?—About 70.

36,283. (*Mr. Chaplin.*) Your farm is on the Lincoln heath?—Yes.

36,284. It is a good deal better than the average of land on the Lincoln heath is it not?—It is.

36,285. I suppose that the flock that you have bred, if it was not for your modesty you would say was celebrated. Is it so?—Well, I suppose it ought to be so.

Results of farming.

36,286. In fact having regard to the quality of your land, the ownership of it, giving you absolute security for any outlay you may make upon it, and the advantages that you derived from this flock you are in an exceptionally good position for making a profit at farming if any body could?—I should say so.

36,287. And yet with all this I understand you to say that you have not made any money, that your farm would sell for less than half what it would have sold for 20 years ago; and that if it was not for your flock you would have given up business in farming altogether?—I could not have kept on I think.

36,288. You were born and bred a farmer, I think?—Yes.

36,289. There are not many farmers in Lincolnshire or elsewhere I suppose, to teach you very much about the business?—I do not know. I do not say that.

36,290. But you do not deny it?—It does not do to have too good an opinion of yourself.

36,291. You are close to a good market?—Yes.

36,292. Yet with all these advantages except for that particular reason that you have owned and bred this flock I understand you think so badly of farming prospects that you would have given it up and retired from the business?—I think I should have been obliged to do so.

36,293. You come here as the representative of the Lincolnshire Chamber of Agriculture do you not?—I am one of the representatives with Mr. Epton.

Cause of depression.

36,294. I understand you to say that it is your view and also theirs that the cause of this depression in agriculture is the great and constant fall in prices?—There is no doubt about that.

36,295. Have you any recommendations to make to the committee for the improvement of the agricultural situation?—I do not know I am sure—to raise prices in some way; I think that is the only thing I see.

36,296. You see no hope for permanent improvement except in some alteration in the present prices?—In some way or shape; I do not know how it is to be done.

36,297. You are not prepared to say how that is to come about or how the present fall in prices is to be arrested; but as long as it continues, you see no hope for agriculture?—I do not.

Changes in system of cultivation.

36,298. Are you able to suggest to the Commission that it would be possible by any change in the method of cultivation to improve matters; on your own farm, for instance, is there any other direction in which it would be possible for you to turn your energies?—I shall keep two years seeds on my own farm, instead of ploughing it up every year.

36,299. The effect of that will be to diminish the employment of labour?—So it will, and if it is carried out all over the country, it will make a great difference.

36,300. Is that an alternative that you think is likely to be adopted generally?—There are two or three reasons against that. Most people are very short of money, and the more stock you keep, the more money is wanted.

36,301. So that although you would save by leaving your seeds for two years in the labour bill, there would be a greater demand upon you for capital because of the extra stock that would be necessary?—Yes, I think so.

36,302. You are going to adopt this course, however, yourself?—I shall.

36,303. And where people are in a position to do so, will that course be likely to be adopted by others or no?—I should think it will sooner or later.

Decreased demand for labour.

36,304. So that in any case you anticipate that there will be a less demand for labour?—I do.

Mr. J. Pears. 23 Nov. 1894.

36,305. And less employment of labour?—Less employment of men—in the winter particularly.

36,306. Did you hear the evidence of Mr. Epton?—Most of it.

Wages.

36,307. Do you concur in what he said about the fall in wages—that they had fallen from 16*s.* 6*d.* about 20 years ago to 12*s.* at the present time?—I think we went up as high as 18*s.* at that time.

36,308. So that the fall in your case has been even greater?—From 18*s.* to 13*s.* 6*d.* at the present time.

36,309. What is it at the present moment with you?—13*s.* 6*d.*; in the next parish, Nocton, they are 12*s.* now.

36,310. Used they to be 18*s.* in that parish?—They were 18*s.* I think at one time.

36,311. Is the fall to 12*s.* likely to become general in your district?—I am afraid so.

36,312. So that I may gather from what you tell me that the fall in wages in your district from prosperous times will have been from 18*s.* to 12*s.*?—That is about it.

Agricultural Holdings Act.

36,313. Have you studied at all the question of the Agricultural Holdings Act?—Very little.

36,314. It does not affect you, of course, being an owner?—Yes, that is it, and so I did not take much interest in it.

36,315. You have all the security it is possible to have in the world, being the owner of the land which you cultivate?—Yes.

36,316. All the security for your outlay?—Yes.

36,317. And yet you have been unable to make it a profitable business?—It has not been profitable lately.

Agricultural Holdings Act.

36,318. I gather then that your opinion would be that no amendments of the Agricultural Holdings Act whatever would really touch the question of agricultural depression at all?—I do not see that it would make any difference.

36,319. Have you anything else that you would like to suggest to the Commission?—No, I do not know that I have.

36,320. Do you think any advantage would be gained by altering the existing law in this respect; that compensation in addition to the compensation which is given for feeding stuffs and artificial manures should also be given for produce grown and consumed upon the holding?—I do not see any objection to it at all.

Compensation for home-grown corn.

36,321. Do you see any difficulty in the case of compensation being given for home-grown corn consumed upon the holding because it may lead to fraud in the demands for compensation?—Of course there is a little difficulty there, but the same thing applies to cake and anything else. If a man is a rogue he will be one.

36,322. Is not the difficulty greater in the case where the produce for which he is to receive compensation is grown upon the holding?—Yes, I think it is more difficult there.

36,323. In the case of produce which is purchased you can always have the check of the vouchers?—Yes, you can.

36,324. I only want to ask your opinion as a practical man; do you see any difficulty or may I say any insuperable difficulty in the case of the home-grown produce?—That would be only when a man was leaving. He would take a farm straight away for 10 or 20 years, and it would only be the last year; he might be using it all the time, but it would be only when he left that the difficulty would arise, if there was any difficulty.

36,325. You do not see that there is serious difficulty on the ground of fraud?—No, I do not myself.

Wages.

36,326. (*Mr. Giffen.*) You state in your brief, I see, that "Labour is quite as costly as in former years." How do you reconcile that with what you have just been telling Mr. Chaplin, namely, that wages were less than in former years?—When that was put in print it was in the summer and we were giving more money than we are now.

36,327. It is always the case that you pay less in winter than in summer, is it not?—Yes, but we gave last winter 15*s.* a week, and now we have come down eighteen pence a week.

36,328. So that the reduction you speak of is quite within the last few weeks?—Since that statement was given in.

36,329. Is that likely to be permanent?—I think it will now.

Mr. J. Pears. 23 Nov. 1894.

Sheep breeding.

36,330. (*Mr. Whitehead.*) I think you said your private prosperity was due to your luck and success in ram breeding?—I think it is a great deal.

36,331. That could only be adopted by a few persons I take it?—Certainly.

36,332. Or else rams would be so cheap that they would not be worth breeding, is that not so?—That is it.

Dairying.

36,333. Now you say in your brief that you have a small dairy, and I understand that you keep 20 cows?—About 20 cows.

36,334. Has that branch of your business been profitable?—I think it is just fairly profitable. There is nothing much in it though.

36,335. You think it could not be extended?—I do not think it could much. We have a difficulty now in getting rid of the butter sometimes.

36,336. If you adopted the sale of milk, would that not be more profitable than butter making?—Where I live I do not think it would.

36,337. I think you told us that you live near a large town, Lincoln?—Yes, but there are a great many people that live near it who supply it with milk. I do not think if I were to send it there I would do any good.

36,338. You think, then, that an extension of the milk business would not be advantageous?—I do not think it would.

36,339. Not in the vicinity of large towns even?—I only keep cows in the winter. It is a very dry country and we have no grass in the summer.

36,340. You have to buy them in then?—A good many of them I buy in in the autumn.

36,341. Does that apply to the greater part of the county of Lincoln?—No; I am on the hill, and there is a lot of it below.

36,342. But you think the dairy system could not be extended in Lincolnshire with advantage?—I do not think it could any further than it is at the present time.

Cattle diseases.

36,343. (*Sir Nigel Kingscote.*) During the time that you have been farming have you suffered from cattle diseases in your neighbourhood?—Not of late years.

36,344. But you did formerly?—We had the cattle plague all round, but, fortunately, I never lost a beast.

36,345. Did your Chamber of Agriculture, or your Association, approve of the restrictions that were made to get rid of these diseases?—I think so.

36,346. At all events you do not find fault with them?—No.

36,347. Not as long as you are kept from having the disease?—That is the great thing, I think.

Reductions of rent.

36,348. As regards rents in your neighbourhood they have fallen very considerably, have they not?—Yes, on one farm I know they have fallen from 37*s.* 6*d.* to 12*s.*, and my own has fallen from 45*s.* to 20*s.*

36,349. When farms are to be let, and fresh tenants come in have they any difficulty in making an agreement with their landlords?—I have not much experience about that. I do not think there is much difficulty, but I do not know.

Land courts.

36,350. Has any opinion been expressed by your association or your chamber as regards another power between the landlord and the tenant? I mean a court, or anything of that sort?—I do not think we want that sort of thing in Lincolnshire.

36,351. You do not want it in Lincolnshire?—I do not think so.

Employment of boys.

36,352. I see there is one subject down on your paper that you have not alluded to yet, and that is that boys are not allowed to work on a farm until they have passed a certain standard?—That is very troublesome to us in summer time.

36,353. In what way?—We cannot get the turnips singled, and all that sort of work done.

36,354. Do you think the boys are kept too long at school, or is the standard too high—are they kept to too great an age, or what is it?—I think the standards are full high for lads of that description.

36,355. Have you a school board or a voluntary school?—It is a voluntary school. We made arrangements to meet that afterwards. I am one of the

Mr. J. Pears. 23 Nov. 1894.

managers, and we let them off two days a week by arrangement, so that we got the work done at last.

36,356. Do you think that works well?—I think it works better than in the other way.

Female labour.

36,357. (*Mr. Little.*) Women do not work with you at all, do they?—Scarcely at all.

36,358. (*Sir Nigel Kingscote.*) Therefore boys' work is very necessary at times, I suppose?—Yes.

36,359. And you have found it detrimental to the farmers that the boys have not been able to come before they have passed the standard?—Yes.

36,360. (*Mr. Dalton.*) Are there any labourers out of employment in your district?—I think there are several now.

Mr J. Pears. 23 Nov. 1894.

Unemployed labourers.

36,361. How does that coincide with the great demand that you have got for boy labour? Could not some of these men come on and do the work?—It is in the summer that we want the boys, and in the summer we cannot get the boys.

36,362. Then there is no lack of employment in the summer?—No, there is plenty of work in the summer for the men, but there is not much now.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Sixty-sixth Day.

Thursday, 29th November 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. BARON RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
ALAN MACKINNON, Esq., } *Secretaries.*

Mr. EDMOND RILEY called and examined.

Mr. E. Riley. 29 Nov. 1894.

36,363. (*Chairman.*) You reside at Hessle near Hull, I believe?—Yes.

36,364. You retired from farming seven years ago, having farmed Kipling Cotes Farm in the East Riding of Yorkshire, which consists of 530 acres of light land?—Yes.

36,365. Are you a member of the Great Yorkshire Society?—Yes.

36,366. Were you also for nine years a member of the Council of the Chamber of Agriculture?—Yes.

36,367. Are you a member of the British Dairy Farmer's Association?—Yes.

36,368. Have you given up farming altogether?—I have given up farming altogether, luckily.

36,369. Did you give it up on account of its not paying?—Partly so. My family had all got to do for themselves, and my wife was getting rather infirm, and I found I could not make it pay, so I thought it best to be out of it.

Description of the Wold district.

36,370. What have you got to say about the agricultural depression?—I must say that my evidence is entirely confined to the Wold districts of Yorkshire. I do not know whether you know Yorkshire. The riding is divided into three different districts. There are the Wolds of Yorkshire, which I am speaking entirely of, which cover about half the area of the riding; then there is the Holderness district, which is a clay district and which is suffering, I should think, more than any other part of the riding; and then there is another part called the Levels, and that is a very fertile soil. The Levels of Yorkshire are the best part of Yorkshire, I am speaking, as I say, entirely of the Wold district.

Condition of agriculture.

36,371. And what have you to say about that?—I have seen several of the large land agents, and they tell me that rents generally have been reduced from 20 to 40 per cent., and in some instances considerably more. As a rule, so far, rents have been fairly well met. The agents say that last year they had more applications for farms than they could meet; for farms coming vacant next spring they have several applications, and for the better class of farms a great many more. In Yorkshire there is not a farm unlet, and if there is a good farm to let there would be any number of applications for it.

Mr. E. Riley. 29 Nov. 1894.

36,372. How do you account for this renewed demand for farms?—It is very difficult to account for it. I believe farmers think that prices have got so very low now that they could not possibly go lower, so they are going back into farming again.

Demand for farms.

36,373. Are the men of capital ready to come in?—On the large farms there are plenty of men of capital to come in now.

36,374. Plenty of men of capital coming in now?—Yes; but then you can go on a farm now for nearly half the money that you could 20 years ago.

36,375. That of course makes it easier?—It makes it easier to go in.

36,376. And that has enlarged the circle of the men who are ready to come in?—Yes, and in the landlords as a class we have a lot of the finest landlords in England.

System of cultivation.

36,377. What is the general course of the system of cultivation in the Wolds of Yorkshire?—You cannot possibly alter it much on the Wolds. It is a thin soil, and the four and five course system is generally adopted.

36,378. Is it generally arable land?—Yes, it is principally arable land; in the valleys there is a little grass land.

36,379. What do they grow, wheat?—No, they are growing very little wheat in Yorkshire now.

36,380. What do they now grow?—Barley and oats. Barley is the principal crop, but this year it is very bad in quality.

36,381. This has been an unfortunate year, I suppose, owing to the want of sun?—Yes; the tenant farmers suffered less from the drought last year than they did in many other places. There was a very good yield of corn, and of very good quality, owing to the splendid summer weather we had.

Mr. E. Riley. 29 Nov. 1894.

36,382. Is there much land laid down in grass?—Not much on the Wolds. There is a little difference in the system of cultivation the last few years. They have laid land down to what we call seeds; that is the clover seeds, for a year or two longer.

36,383. In spite of the rents having fallen there are a considerable number of persons ready to come in and take the land at present prices?—Yes, at present reduced rents.

Average rent.

36,384. What is the average rent?—It is very variable. In many places it has gone down very much. From 10*s.* to 20*s.* an acre on what we call the Wold land, and 25*s.* the better land with grass.

36,385. What is the better class of land?—The better will go a little, but not much, higher than that; there is great irregularity.

36,386. Is 20*s.* about the highest rent?—Less than that on the really Wold districts.

36,387. What should you say it averages, 15*s.* an acre, or what?—I should think not much more than 15*s.* We have had reductions of about 40 per cent. Then on the Yorkshire Wolds many people breed hackneys and they are doing well; ram breeding is also carried on, and that helps farmers very much.

Results of farming.

36,388. Then, one way or another do you say that the tenant farmers have been able to make the two ends meet there?—No, certainly not this year, many will lose half the rent.

36,389. But apart from this year, what has been the result of the last few years?—Through the reduction in prices they will loose a great deal of the rent this year.

36,390. That appears to be due to the bad production of this year?—Yes, and the extraordinarily low prices of cereals.

36,391. You said the district had not suffered from the drought of last year?—No, we suffered nothing comparatively, except the hay crops.

36,392. Take the last three or four years, have they done very badly or not during those years?—They have not done so badly; the year before last many of the farmers did very well.

36,393. Then this year is rather an exception?—Yes, this year is a great exception.

36,394. The fact that the experience of the last three or four years has not been bad, I presume, accounts for the circumstance that other tenants are ready to come in?—Yes, but the good tenants now are suffering more than the bad ones; for if a good tenant, who has been farming very high, gives notice for a reduction of rent of his farm there would be no end of applications for it, so that he dare not give up a farm now, he would rather lose a little more capital than give his farm up.

emand for rms.

36,395. There is such competition for really good farms that a good farmer does not like to run the risk of asking for a reduction of rent, I suppose?—He wants a reduction and landlords are very glad to do what they possibly can for him.

36,396. But beyond a certain point?—Beyond a certain point some landlords are not much better off than the tenants are, and what with one thing and another they cannot give further reductions of rent.

36,397. And the tenant, as I understand, does not like to insist upon a reduction, lest the landlord should act on his notice to quit, because the landlord can easily get another tenant?—There would not be the slightest difficulty about that—in fact, one land agent told me the other day that he had 20 or 30 applications for farms.

The Holderness district.

36,398. It certainly seems a remarkable condition of things if farms generally are not doing well, that there should be so many people ready to come into a bad business?—It is remarkable; but that is only in the Wold district. When you get to the Holderness district of the riding it is very different; it is essentially a wheat growing district there.

36,399. Heavy land?—Clay land.

36,400. And growing wheat in the main?—Yes.

36,401. There it is different?—It is entirely a wheat-growing district.

36,402. Has the reduction of rent there been greater than in other districts?—I cannot speak so much about the Holderness district. My remarks are entirely confined to the Wold district.

Mr. E. Riley. 29 Nov. 1894.

Labourers in the Wold district. Wages.

36,403. What has been the condition of the labourers on the Wold?—The labourers were never in a better position; but I am afraid many will be out of work this winter. Farmers are so forward with their work that they intend to do with as few as possible; in fact, they cannot afford to pay for any extra labour, and they prefer to part with some rather than to reduce wages. I may say that in Yorkshire the generality of the farmers have decided not to reduce the wages; they would rather, if they are employing three labourers, or four say, do away with one.

36,404. What have been the wages there of late years?—Half-a-crown a day.

36,405. Have they risen or fallen of late years?—They have been half-a-crown a day now for the last eight or 10 years. I remember when a labourer was very glad when he could earn as much a day as would pay for a stone of flour; now a labourer can earn three stones of flour a day.

36,406. Do the labourers generally bake at home?—No, I am afraid not so many as ought to do. We have large bakers, especially in the parish where I live now, and they are charging as much for bread as they did three years ago.

36,407. When you said that a labourer formerly got one stone of flour, and now can get three stones, I thought that probably pointed to the fact that the labourer was baking for himself?—In the rural parishes they are bound to bake for themselves, for they have no bake-houses there.

36,408. What you say, at all events, points to this, than the labourer is very much better off than he was?—Decidedly better.

36,409. The low price of wheat and of other things that he uses has been a great advantage to the labourer?—A very great advantage.

36,410. And his wages have not fallen?—No, they have not; they have rather increased if anything.

36,411. Even this year, when the farmers are badly off, in consequence of bad barley harvests, they are not reducing the wages of their men?—No, they think it is better to pay the same wage, and do with less men. They find that the men do not feel inclined to take less. If you have a man who is taking less wages than he thinks he ought to have, you cannot get any work out of him. So they think they will do with less labour, and the season is so open that they can do with less labour.

36,412. Then the difficulties of the farmers in the district appear to be mainly due to the bad season of this year?—Yes, bad seasons and extraordinarily low prices of cereals.

Farmers' expenditure.

36,413. If next year they have a better season they hope they will be better off?—They are hoping, but I am afraid it is a poor hope. They have not been making any money. Then the expenses of farmers are not nearly half now, compared with what they used to be.

36,414. The expenses of farming, do you mean?—I mean the personal expenses of farmers.

36,415. Their personal expenditure is one-half less than it was?—Yes. I fancy all the tradesmen are suffering now as much as the farmers are.

36,416. (*Mr. Everett.*) I thought you said the farmers were not suffering, except for this particular year?—They are suffering very severely this year, but last year I say they did not suffer so much as farmers in other parts. Three years ago, in the wet season, they suffered a good deal owing to the harvest being about as long again as it ought to have been.

36,417. (*Viscount Cobham.*) You meant to say that the personal expenditure of the farmers has been very considerably diminished for a long time past?—Yes, for the last seven years, and for the last year or two very much indeed.

36,418. (*Chairman.*) When did that date from?—I should think from the last seven or eight years they have spent very much less. Now, if they can possibly do without anything, an implement or anything else, they do without it; they will patch up anything. Then the tradesmen are suffering as much as they are, I mean the joiners and the blacksmiths, and all those partly dependent on farmers.

Rates.

36,419. You said that the rents have been reduced from 20 to 40 per cent.; have the farmers had the advantage of reduced assessments in their rates?—Where the rent has been reduced they have got it; but

Mr. E. Riley.

29 Nov. 1894.

there is one landlord who does not like the idea of reducing the rents, and he gives so much per cent. back. You cannot get the assessment reduced then. I know in some instances the landlord has paid the extra rates.

36,420. Paid the extra rates upon his abatement, do you mean?—Yes. They will not allow the abatement unless you get the rent reduced.

36,421. But I understood from you that the permanent reductions of rent have been general?—Yes.

36,422. Although in some few cases the landlord has made abatements instead of permanent reductions?—Yes. I know one landlord who has, and he is, actually paying the rate that the assessment people will not allow to the farmer because it is not a permanent reduction.

36,423. That, apparently, is an exceptional case, rather?—Yes, that is an exceptional case.

36,424. The general rule has been for the landlord to make permanent reductions, and then the tenant has got the benefit of that in reduced assessments?—Yes, during the last four or five years.

36,425. Does it follow, as a general rule, that the assessment committees reduce the assessments in proportion to the reduction of rent?—Yes, I believe so, as a general rule; in fact, I do not know any cases where they have not. But it is only within the last few years that, I think, they have agreed to do so. I believe where the farmer applies specially he can generally get it done.

Deteriorated farming.

36,426. Has there been any deterioration of farming in the district?—There has been very great deterioration in many places; in fact, the farmers, in order to live anything like properly, have not used the manures they used to do.

Farmers' capital.

36,427. Do you think they have got insufficient capital?—Yes, that is the case with many farmers. With some farmers their capital is very insufficient.

36,428–9. But you have stated that men of sufficient capital are ready to come in?—Yes, we have plenty of men of capital to come in; and some men of not too much capital, where a farm has been well farmed, will come in and farm it for three or four years and put nothing into the land. I know two or three of that class. I can instance one gentleman who has taken about 6,000 or 8,000 acres of land, including one farm adjoining me. When he went to it four years ago there were 30 days' thrashing on the farm, but this year there was only 10 days' thrashing; and he will leave it this year. He has got all out that he possibly can.

36,430. Generally speaking, what are they?—They are a class of men who went out of farming eight or ten years ago, some of them, but who have a little capital. I know at least three or four of that sort. They will go and take good farms; but I think the landlords are now rather suspicious about letting to them. When I gave up farming seven years ago, my farm was in a very good condition, but they had the very greatest difficulty in letting it—in fact, they had to let another farmer exchange in order to get the farm let at all; now they would have 20 applications for the same farm.

36,431. Take the case of those 20 applications, are they all men of the same district?—Pretty much. Some farmers think they can get a better farm, and so they will leave one farm to go to another. They hear that a farmer is going to leave, and they will give notice on their own farm and get the other. The farms seem to go off in that way.

35,432. Your evidence seems to indicate that there is a considerable class of people with sufficient capital who are ready to take farms?—That is in the Wold district of Yorkshire.

36,433. Are they men belonging to the district?—Yes, they belong to the district.

36,434. Are they men acquainted with farming?—Yes, they are acquainted with farming. There is a very good farm I know; the tenant gave notice for a reduction; they found he was not very steady, and that he was getting rather short of capital. Another gentleman, who has been farming in Lincolnshire, but who was a Yorkshire farmer, came over and took the farm just now—within the last week.

The Agricultural Holdings Act.

36,435. Now, what complaints have you to make of the general causes of this depression, such as it exists? Have you any complaint to make of the Agricultural Holdings Act?—The Agricultural Holdings Act wants very great alteration.

Mr. E. Riley.

29 Nov. 1894.

36,436. In what direction?—A Committee of the Central Chamber of Agriculture has been sitting to consider it, and I think farmers generally consider that an alteration on the lines of the report of that Committee would be a very good thing.

36,437. They would be satisfied with that?—I think they would be. The recommendations, if they can be passed into an Act, seem very fair.

36,438. Is there any desire in the district for judicial rents?—One gentleman, a very large farmer, says he does not see why we ought not to have an Irish Land Act.

35,439. But that is only one man?—Yes, but I think there may be a few more.

35,440. Is there a general desire in that direction?—No, I do not think there is; I think there is such a very good feeling between the landlords and the tenants that there is no general desire for that.

Tenure.

36,441. What are the holdings generally—are they held from year to year?—Yes, from year to year principally.

36,442. Are the landlords ready to give leases if the tenants wish?—I do not think the tenants care much for leases.

36,443. They do not care for them?—No, they have got pretty good tenant rights now, and they do not seem to care.

Restrictions on cultivation.

36,444. Are there many restrictions on cultivation in the terms of the agreements?—In the terms of the agreements there are a great many restrictions, but practically if a man be a good farmer I think they let him do pretty much as he likes. Landlords do not care to part with a good tenant; they know very well that as long as he is farming well he cannot be injuring the land. In some districts they allow the tenant to sell straw where he is near a railway. I know one farmer who makes nearly half a year's rent out of his straw. A few years ago you could not do that.

36,445. Generally speaking, have these restrictions been removed or have they been insisted on?—They are on the agreement, but still the landlords wink pretty much at it if the tenant be farming well. There is no difficulty about that if you go to an agent and tell him what you want to do; the only thing is that if you are going to leave your farm they wish you to leave it according to the agreement. Practically, a good tenant is allowed to do pretty much as he likes.

36,446. What are the measures which you recommend?—That is the most difficult thing to answer.

Low prices.

36,447. (*Mr. Everett.*) I do not think you have been asked what are the causes?—The causes are patent to everyone—the low prices of produce, the bad season, and foreign competition.

36,448. (*Chairman.*) What remedies do you recommend?—I have seen 20 or 30 large farmers since I was asked to come up here, and I will just read what some of them say. It is a most difficult problem to solve. Many of them say a return to better prices is the only remedy they know of; but as they cannot possibly get prices advanced by Act of Parliament I suppose the natural law of supply and demand will have to do it. Some help would be the removal of the burdens on land; that is a very great point with all the tenants now; they say that many burdens ought to be taken off the land.

Rates.

36,449. Do you know what the rates average in the district?—As a rule in most of the parishes they are about 3*s.* in the pound, but we have some parishes connected with local boards where the rates go up to 5*s.* in the pound, and there are very great complaints there. There is one parish near me where they have spent 20,000*l.* in drainage, and where the gas and school board rates are very high. The farmers in that parish get not the slightest benefit from the drainage, which is four or five miles away from the farm.

36,450. They have only to contribute on the one-fourth to that, I suppose?—Yes, but still it is not the slightest advantage to a farm to have this drainage five miles away.

36,451. That affects those within the local board districts?—Yes.

36,452. But in the purely rural districts they are not subject to that?—No.

Mr. E. Riley.
29 Nov. 1894.

36,453. And there you say the rates average about 3*s.* in the pound?—I should think they average about that.

36,454. Have they risen or fallen?—They have rather risen lately; the rates always do rise.

36,455. Are you quite certain of that?—Yes, they generally rise. Then I am afraid we are going to have some extra rates put on for the parish councils; I see they are to be paid out of the poor rate.

36,456. That is a matter of the future rather than of the past?—The school board rate when it was put on was only to be so much in the pound, but it is more than double that already; we shall find that many of the working men will get on the parish councils, and they will not be particular about spending money; they will find some way of increasing the rates.

36,457. What else have you got to suggest?—The removal of the burdens on land is a very great thing.

Reduction of rent.

36,458. What else?—One large farmer tells me that it is altogether a question of rent. He says the labourer should be paid first, the farmer second and that what is left should be rent for the landlord.

36,459. That seems to be sound political economy?—I do not agree with it.

36,460. (*Mr. Long.*) That is practically what happens now?—It is so in many cases; the landlord, I am afraid, does not get much from poor land.

36,461. (*Mr. Little.*) In all cases the labourer gets paid first, does he not?—He does. Then there is a farmer tells me that his farm has been in the hands of the present family for 300 years, and the farm is well done—splendidly done—who says he cannot get a proper reduction in rent and complains that his landlord has large properties in Ireland badly farmed, which he is offering to his tenants at 14 years' purchase, but that his landlord will not give him such terms, and does not care to reduce his rent much.

36,462. (*Chairman.*) Then there are farmers who think there should be a further reduction of rent?—Yes, there is bound to be if things go on as they have been. Then there is another farmer, a large farmer too, and a very first class farmer, who says: "The only relief I can "suggest"—these are not my opinions in any way, they are what I have got from the different farmers—

Irish land laws.

"The only relief I can suggest is an Irish land law for "England. The best landlords need have no fear of "it or any other; it would only catch the bad ones "who want more than the land is worth. Why "should not the English farmers have the same laws "for land as the Irish."

36,463. Was that the farmer you referred to a little while ago?—No, this is another farmer; these are two separate farmers.

36,464. I mean is this the man that you referred to a few minutes ago as being favourable to judicial rents?—Yes, he was favourable to judicial rents as well.

36,465. Then is it another one?—This is another one here that I am reading now: "Why should not the "English farmers have the same laws for land as the "Irish; they have been more industrious, careful, and "law respecting." Then here is another gentleman who writes me that he would boldly go in for a 5*s.* per quarter duty upon wheat as revenue, which would raise at the present time, on the present imports, 8 millions and make bread but a little dearer. I do not think it would make it much dearer, for many bakers still charge nearly as much for the 4 lb. loaf as when wheat was double its present price. Then a good many farmers are of this opinion: they say that most manufactured articles should pay an *ad valorem* duty and that there should also be a duty on barley. The duty on manufactured articles would give more employment to our artizans and labourers and so in that way it would help the farmer. Some of the farm labourers say they would not object to paying 1*s.* 9*d.* for flour, that they could afford to do that; if you did put the 5*s.* duty on, the labourer could afford to pay the 1*s.* 9*d.* and the farmer would be better off. Then some say they would like to see a duty put on eggs. That would only affect the large biscuit manufacturers and confectioners, who are charging the same prices as they did before flour was so cheap. A great many think that bicycles might be taxed; that would raise a very large revenue. On all these questions it is said that they will affect the working man. Why not; the working man is much better off than either the landlord or the tenant, and if there were a tax on bicycles he would save it all in shoe leather.

Duty on wheat.

Duty on manufactured articles.

Tax on bicycles.

36,466. (*Mr. Lambert.*) Do you mean that the working men would ride bicycles?—Hundreds of them ride bicycles.

Mr. E. Riley.
29 Nov. 1894.

36,467. Agricultural labourers?—Yes, many of them go to their work on bicycles.

36,468. (*Chairman.*) Is that the case generally in the district, that the labouring men go to their work on bicycles?—Yes, all the bricklayers and artisans going about the country go on bicycles, hundreds of them.

36,469. (*Mr. Chaplin.*) Whether they are bad roads or good ones?—Yes. At this time of the year they do not go so much, but up to the end of last month they were going very much on bicycles. A lot of agricultural labourers now have bicycles.

36,470. In Yorkshire?—Yes.

36,471. (*Chairman.*) Do they buy them or hire them?—I think they buy them cheap.

36,472. (*Mr. Long.*) Now that expensive bicycles have been introduced the cheaper ones have been knocked out, and you can get the older ones very cheaply—for 3*l.* or 4*l.*, I believe?—Yes, you can get them very cheaply now. In the Wold districts they have to go two or three miles to their work perhaps.

36,473. (*Chairman.*) In those districts, do they live very much further off—in villages?—Yes; they will not live in the out-of-the-way cottages now.

36,474. They will not do that?—No.

36,475. They like the sociability of the village?—Yes, and their wives will not live out of the village now; that is the great difficulty.

36,476. Their wives will not live in isolated places?—No. I say if there is a duty of 5*s.* placed on bicycles a man would save it all in shoe leather. He very soon walks a pair of shoes away.

36,477. (*Mr. Lambert.*) But you would make his bicycle dearer?—Yes, I would; he can afford to pay better than the landlord or the tenant can.

36,478. You would not save his shoe leather by making his bicycle dearer?—If a man is walking on flinty roads on the Wolds he will wear a pair of shoes out very soon.

36,479. You want to make the bicycle cheaper in order to save shoe-leather?—It is like bread; it is so cheap they do not care to have it any cheaper; when he is riding his bicycle he is not wearing his shoes out, his shoes must last much longer.

36,480. (*Mr. Elton.*) He is sure to go on the bicycle whether you tax it or not; that is what you mean?—Yes, if you have to walk two miles night and morning to your work you would very soon wear a pair of shoes out.

36,481. (*Mr. Lambert.*) But if you tax the bicycle, then you make it more difficult for a man to get a bicycle, therefore he will have to wear his shoes out?—Yes, but I say he will save it all, because he will not wear so many shoes by about two pairs of shoes a year if he rides his bicycle.

36,482. But if you tax his bicycle he will not be able to ride it?—5*s.* is so little a tax that he would not mind.

36,483. (*Chairman.*) What else have you to recommend?—There is one other question about the granting of State loans. Many of the landlords do not think very much about that, but if some means could be devised, something after the agricultural credit banks, to enable tenants to buy stock, that would be a very great benefit if it were made penal for them to sell their stock. The difficulty now is that the farmers have parted with so much of their stock to keep going on with, and as the Wold farmers depend entirely on stock, they have not money now owing to the low prices to buy in stock again.

State loans.

36,484. Then with regard to poultry-farming I believe you have something to say; what is it?—Dairy and poultry-farming cannot be carried on to any great extent in the Wold district. It is not at all adapted to the district. Poultry-breeding is greatly neglected, although it pays well when properly managed; but on most farms there is no system of management. The East Riding County Council now are doing good work by sending scientific lecturers to the villages.

Poultry farming.

36,485. (*Viscount Cobham.*) On poultry-farming?—Yes. We have had some splendid lectures on poultry-farming. A farmer generally keeps his stock of poultry and never changes the blood at all, and so when

Mr. E. Riley.

they have been going on for years they begin to deteriorate.

29 Nov. 1894.

36,486. (*Chairman.*) Then I think you also believe that something should be done for light railways?—In many of the Wold districts it would be a very great advantage to have light railways.

Light railways.

36,487. (*Sir Nigel Kingscote.*) I wish to ask you whether the evidence you have given to-day is confined entirely to the Wolds of Yorkshire?—Yes, entirely to the Wold district.

36,488. You do not come down nearer to Hull, to Sunk Island, or anywhere there?—No. They are suffering very much more in that district than on the Wolds; in fact, they are suffering more there than in any other district in Yorkshire.

36,489. Which district do you call that?—That is the Holderness district. In the Holderness district there are about 160,000 acres, and in the Wold district there are 400,000 acres.

36,490. But you are speaking for the Wold district?—I am speaking entirely for the Wolds. I have lived all my life there, and know all the Wolds.

36,491. (*Mr. Gilmour.*) You said your district was a barley district?—A great deal of barley is grown there.

Malt tax.

36,492. Have the farmers there given any expression of their views with regard to the malt tax?—I was examined on the malt tax when it was taken off. We were very much in favour of it being taken off malt, but we had no idea that Mr. Gladstone was going to allow men to brew from anything; if we had known that we should not have gone in for the tax being taken off. It has done a great deal of harm to the good barley-growing districts. Now that they are allowed to brew from anything, you cannot get the same price for the best barleys.

36,493. Has there been a general expression of opinion amongst those barley-growers with regard to this question?—I think it has died out in the last few years. Some of them would very much like to have a duty on barley. You seldom hear the malt tax mentioned now.

36,494. There is no express desire, I understand, to have it re-imposed?—No. I do not think so. I never hear it mentioned. There is some fine barley grown in the Wold districts, and the maltsters like it very much. This year there is very little. It is a great drawback to farmers this year that many of them grow no wheat, but grow a lot of barley, and owing to the very sunless summer we have had the quality is so poor that it will not make malt. Last year we had some splendid malting barley.

Restriction on cultivation.

36,495. You spoke of the benefit that would arise from taking off certain restrictions on cultivation, or at any rate of the landlord allowing his tenant to sell straw, for instance, off his farm, although he was bound in the lease not to do so; if it became general to do away with that restriction, and all the farmers in that district were to sell straw, would that be of much benefit to the farmer?—It is only in a very few districts where you can sell straw. You must be, in the first place, near a railway station, because it would not pay to cart straw four or five miles. It is too bulky. For many farmers it would be of very little use to sell the straw, having regard to the expense of carting it about.

36,496. Do you think in those cases it is wise on the part of the proprietor to have a restriction in his lease that his tenant should not be allowed to sell straw?—I think it is unwise. I think that a tenant farmer ought to have no restrictions. The agent is the proper man to attend to that, and if a tenant is not farming well the agent ought to look after him and get a better tenant.

36,497. Yours are entirely yearly tenancies, I understand?—Yes. I think the Yorkshire farmer prefers a yearly tenancy. We ought not to have any restrictions, and I think you will get land as well farmed without them. The farmer does not like being so restricted.

36,498. I think you mentioned the case of a man who was farming near you who was selling everything off his land and leaving the farm after having, for a very few years at any rate, taken everything out of it?—I did not say that he sold everything off. He consumed all the straw, but he farmed it so badly that he never put anything on to it. When he took the farm five years ago he had 30 days' threshing. I do not know whether you understand what that means or not?

26,499. Yes, quite?—This year he has only about 10 days' threshing, and the land is in such a state that I should think it would be very difficult to let. He has sold nothing off his farm, but he has put nothing on to it. He has managed it so badly that it will not grow much now. The first few years he got all out of it. It was just the same way with his other five or six large farms which were taken on a lease for five years. Six or seven years ago a landlord was very glad to let farms on any terms rather than have them in his own hands.

Mr. E. Riley.

29 Nov. 1894.

36,500. But I think I am still right in understanding you to say that in many places this doing away with the restriction as to the selling of straw would not help the tenant if he is a certain distance from a railway station?—No, not in the least if he is too far away from a station. The expense would be greater than the profit would be if you are more than a mile or two miles from a station. It does not pay to cart such bulky stuff as straw very far.

36,501. Is there any other restriction in leases in your quarter which you think could be properly done away with?—I think there are some of them in regard to cropping. I think, generally, on well farmed land you can take two white crops. Where land is well farmed, you do not do the land any harm by taking two crops. I think that is getting pretty general. I think most of the landlords are allowing that where the land is well farmed. I say that many farmers think that there ought to be no restrictions. They think that it is the agent's duty to see that a tenant is farming well, and if the tenant does not farm well, let him go.

36,502. You do not consider that it is necessary to bind him down to bring in a certain amount of manure to make up?—Yes, I think when you sell the straw you ought to get the extra manure. On the Wolds we use a great deal of manure for turnips, and so on. If a tenant sold straw, I would not let him have that money to pay for his turnip manure; I would make him bring extra manure. Where you sell straw, you generally take it to the railway station, where you can get any amount of very good manure for 3*s.* or 4*s.* a ton, and you can bring three times the quantity of manure back with you, compared with what your ton of straw would make.

36,503. You would insist on an equivalent?—Yes, I should insist on an equivalent where straw is sold.

Reduction of rent.

36,504. (*Mr. Clay.*) You say that rent has been reduced about 20 or 40 per cent. in Yorkshire?—Yes, and in many cases much more.

36,505. Has that met the requirements of the sitting tenant?—It has not done so in a year like this, but up to this year I think it has pretty well. The farmer has just managed to live, but he could make nothing on it. Now if things go on another year or two as they are, many farmers will not be able to farm rent free.

36,506. (*Mr. Chaplin.*) Rent free did you say?—In many cases at present prices I say they cannot if they have it rent free. I can give a very good proof of that, for we have some yeomen farmers a little higher up in the riding, and they cannot make a living where they have no restrictions or anything at all, that is at the present prices.

36,507. (*Mr. Clay.*) Has their capital gone?—I am afraid that in many places the farmer's capital has gone very much indeed.

Demand for farms.

36,508. Yet you say at the same time that if there are any farms to let, there is a strong competition for the farms?—That is with farmers who went out of farming eight or ten years ago, and just have a little capital left. Farmers naturally get tired of being out of farming, if they can get a good farm for a few years they think they can get a pull, and make a little bit of money out of it.

36,509. What do you think of the position of these men who are taking these farms at present rents?—Unless times become better they will be in as bad a position as the old ones; but there was a general impression last year that things had gone down as low as it was possible for them to go, and then you can get a farm now for about half the capital you wanted a few years ago, quite half the capital. There is nothing dear except sheep, and they are very dear; but unfortunately, in the East Riding according to the returns, they are very much below their numbers, and last spring farmers sold many of the sheep, thinking that after the harvest they would have a little money to buy more with, but with the low price of corn they

Mr. E. Riley.

29 Nov. 1894.

had not money to carry on with, and they cannot buy sheep at all.

A large farmer in the Wold district.

36,510. Are the farms of these men properly stocked with sheep and cattle?—No. In the Wold district we are entirely dependent on sheep. There is one large farmer I have in my eye just now who farms 1,200 acres of land. I have seen his books; he has spent 1,500*l.* a year in linseed and cotton cakes. He keeps a flock of about 1,300 to 1,500 sheep, and feeds—he never breeds—200 to 250 head of cattle. He has done that for some years now. He is using exactly the same quantity of cake, in fact at the present time he is using a ton of cake a day every day; he says he dare not do otherwise. He has got a good tenant right in cake, and if he was to use less this year he would lose a lot. It is on the three years' average; you get a tenant right on the three years' quantity used.

36,511. Is he able to pay his rent?—Yes, he is able to pay his rent, but he wants it reduced, and he told me the other day that if times go on as they have done he will be obliged to have a reduction of rent or leave his farm, but he would rather spend a little more capital now, using exactly the same amount of cake, as I say, because that keeps his tenant right better. If he were to use no cake this year, as it is on the average of the last three years, that would bring his average down very much.

36,512. What is that gentleman's rent?—I should say a very little over 17*s.* an acre. It is a splendid farm, and under a first-class landlord. His landlord will not let him leave if he can possibly keep him.

36,513. That farm might not pay at 15*s.* an acre; still it might pay at 10*s.* an acre, might it not?—He says he should be perfectly satisfied if he could get half a year's rent returned for this bad season.

36,514. That is a question of rent, is it not?—Yes; it will be entirely a question of rent.

36,515. Now with regard to these lands which are not worth any rent, and which are not worth cultivating. Had they not better be let go for grazing sheep without any expense being gone to on them?—It is the high farmer who is getting the benefit of the bad years now. His land is in such good condition, and he has no wheat—he has not grown a handful of wheat,—it is principally oats this year—so that he is not losing so much as some of them. I have known this farm I have just been speaking about for the last 10 years, and I never saw better turnips grown on it than there is now.

36,516. That will be due to that gentleman having capital?—Yes, and to his feeding 250 head of cattle—he never breeds any—and keeping a flock of 1,300 to 1,500 sheep. He is obliged to have a second crop. Some of the corn would be nearly wasted if he did not grow a second crop. He can get a better quality of corn by having two crops; in fact now, with barley, we generally say that we can get a very much better sample of barley on the second crop than on the first for the maltster.

Farmers' capital.

34,517. Is the depression not considerably intensified by a man farming too much land, or by the want of capital?—In some cases it is, but in our Wold district a man if he has anything like capital can farm 1,000 acres cheaper than he can 500. For the 1,000 acres only a few extra men and implements and a few more horses are wanted.

36,518. As a rule, as you know, farming will not stand the burden of bank interest upon it?—No, it is a great loss if they have not the capital, a very great loss. Then another thing, bankers, middlemen, and those people will help a good farmer a little bit more. The bad farmer has every disadvantage now. Bankers fight rather shy of advancing money to bad farmers, but a good farmer, like the one I have mentioned, if he wants an advance of 500*l.* or 1,000*l.* has no difficulty in getting it for a short time.

36,519. In the case of a farmer without capital the middlemen you have mentioned take advantage of him?—Yes, a very great advantage.

Co-operation for the purchase of feeding stuffs, &c.

36,520. Is that not often the reason why the banks curtail his credit?—The Holderness Agricultural Club started co-operation in order to buy cakes, feeding stuffs, clover, seeds, and they asked me if I would manage it for them. We started with clover seeds this last year. We could sell them to the farmer for 4*s.* a stone less than he could get them with a guaranteed analysis of purity from the Royal Agricultural Society's botanist. We sold a few hundred pounds worth, but it was principally to men who had capital. One of the conditions was that they must pay cash. We could not do it without the payment in cash. Therefore the farmers that we intended to benefit could not take advantage of it. Several of them came to me and said they would be delighted to do so, but the fact was that they were not clear of their seedsman for last year, and they had not paid all up for the seeds for last year.

Mr. E. Riley.

29 Nov. 1894.

36,521. So that it comes to this: that energy and capital often pull a man through when otherwise he would go to the wall?—Yes. We cannot offer any benefit to the farmer that we want to benefit. That is so with reference to the State loans. If by any means they could help a farmer in that way there is many an honest man who, if he had more capital, knows how to farm properly, and would farm properly.

State loans.

36,522. Regarding State loans, what security could a farmer give to the Government for a loan?—If he bought a flock of sheep, or anything like that, I should have them as a security, and I should make it penal for him to part with them to anyone except to the proper authority.

36,523. The sheep might, perhaps, die and disappear?—You might make him insure them; I believe there would be no difficulty about insuring.

36,524. Do you not think there would be a little difficulty in a guarantee on the sheep?—As a rule, on the Wolds, I know many farmers to whom, if they could get a little help in that way, it would be a very great assistance.

Corn cake.

36,525. But, still, there would be considerable insecurity in the loan, would there not?—There would be a little; but now you are not only ruining the farmers, you are ruining every interest connected with them. Some of the seed crushers tell me now that they must make less cake, there is so little demand for it, owing to the farmers using so much of their own feed. I am very glad of one thing, Hull has been a great place for making what they call corn cake, and farmers have been very much overcharged for it. They have been buying at 7*l.* per ton, and selling their own produce at 4*l.*; now, I think, they are making little.

36,526. Is that not accounted for by the want of energy and business habits of a farmer?—That has a great deal to do with it. It is surprising how farmers in the last few years would buy that cake, but the manufacturers pushed it a good deal, and got the farmers into their books for a ton or two of the cake, and kept them there.

Description of district.

36,527. (*Mr. Little.*) Your evidence refers to about one-half of the east riding of Yorkshire, does it not?—I will just give you particulars: the Wold district has an area of 400,000 acres, the Levels 200,000 acres, and the Holderness 160,000 acres; that shows that it is a little more than half.

36,528. The two other districts, the Levels and the Holderness, are less favoured, I understand, than the Wolds?—The Levels district is generally good loamy soil, and I believe they are doing fairly well. The district runs from Hull round to the Vale of York.

36,529. They grow potatoes and mustard?—Yes; but mustard is paying very badly this year.

36,530. It is a varied cultivation?—Yes.

36,531. And the district does not depend so much upon corn?—No; and they have more grass land.

36,532. The Holderness district, so far as you know, is less fortunate than the Wolds?—Yes, most of it is very strong land.

Demand for farms.

36,533. Is it possible that the competition you speak of, as existing at the present time, for Wold farms, is increased by people coming from less fortunate districts?—Yes, I think it is partly owing to that. You soon get to know when anyone is leaving a farm, and a man who has a farm not so good will change into it. Many of the landlords allow a tenant on a poor farm, if he be a good farmer, to go on to a better farm. We have some of the finest landlords possible. There is a letter in the "Yorkshire Post" yesterday from an East Riding farmer, which I read as I came up to London in reference to his landlord; I think everyone ought to read it; I do not know whether you would care to hear it read; I have it here.

Rates.

36,534. Perhaps you would hand it in. There is only one other question I have to ask, and that is about the excessive local rates in urban districts. What you have

Mr. E. Riley. 29 Nov. 1894.

said would not apply in purely rural districts, but you have urban districts which include a very considerable area of agricultural land, have you not?—Yes, we have several urban districts which are principally composed of agricultural land. In the parish of Hessle, they have been trying to get it made into a rural district, and I know one farmer who is leaving his farm principally on account of high rates.

36,535. The pressure of rates?—Yes. I expected to have had the figures. I do not like to mention them now for I cannot vouch for them, but they are very considerably higher than on farms adjoining.

36,536. In such a district a farmer may be rated for purely town purposes from which he derives no benefit whatever?—Not the slightest.

36,537. Such as lighting the streets and draining the town?—As to the drainage of a town, he is four or five miles from the town, and then he has to pay gas rates and sanitary rates. I do not see that that is the slightest benefit to a farmer. That is a very great matter; and farmers say they ought to be entirely relieved from many of these things except just purely local rates.

36,538. Even where the farmer pays only upon a fourth of the value of his land he is subject to a burden from which he derives no benefit whatever?—That is so. In many of the Wold districts they suffer a good deal from want of water. That was the great drawback last summer, there were not sufficient reservoirs.

36,539. Do you mean in the villages or on the farms?—On the farms.

36,540. The sanitary authority supplies water to the villages, but does not supply it to the farms?—That is it. In fact some farmers would be very glad to have water from the waterworks, but the authorities will not lay the pipes down for them.

36,541. The land has to pay for supplying water to the houses?—Yes.

36,542. But the houses will not pay for supplying water to the land?—No, they will not bring it to the farms.

36,543. (*Mr. Gilmour.*) What is the population of this town that you specially referred to just now in reference to this district?—The urban district?

36,544. Yes?—I could not say exactly.

36,545. (*Viscount Cobham.*) What town is it?—It is Cottingham; that is in the centre of an urban district and it extends so many miles. All the land in that parish, it makes no matter how far away it is, is included under the urban sanitary authority.

36,546. (*Mr. Gilmour.*) Is it a 3,000 place, or a 2,000 place?—I should think it has about 3,000 inhabitants or something like that.

36,547. (*Mr. Dalton.*) How did it come to be an urban district?—It was made one a few years ago.

36,548. Did they adopt the Act themselves?—Yes; and in Hessle, where I am living now, we tried to adopt it; we have 3,000 or 4,000 inhabitants.

36,549. (*Mr. Chaplin.*) You tell us that there are plenty of good men with capital who come on to farms——?—Yes, I believe there are plenty.

Demand for farms.

36,550. You tell us that, and also that there are more applications for farms; is that partly owing to the fact that you had a better year last year in Yorkshire than in many other counties?—Yes, I think that partly has to do with it.

36,551. What happened there I think was that while many other counties were suffering from drought you had a good deal of rain?—Yes, we had nice rains. Some of the grass suffered a little from the drought, but then stock as a rule do very much better on a short pasture.

Horse breeding.

36,552. Then you said a good many men on the Wolds had taken to breeding hackneys to a considerable extent; is that another important factor in causing the demand for farms?—Yes, it is a very important fact. Some farmers devote all their attention to that. Many of the farmers keep a hackney brood mare or two. We had a hackney stallion sold by auction the other day for 4,000 guineas.

36,553. That might partly account also for there being a better demand for the farms?—Yes there are some people who like to go in for hackney breeding if they can get hold of a Yorkshire farm—in fact, there is a gentleman come out of a manufacturing district near to Driffield, who is taking a farm for breeding hackneys—he is a man who is well to do.

Mr. E. Riley. 29 Nov. 1894.

36,554. Then you also told us there are lots of the finest landlords in the world in Yorkshire?—No doubt.

36,555. Has that something to do with it?—That has a great deal to do with it. You have a few good ones in Lincolnshire. We have one landlord now who is spending 180,000*l.* over building a church said to be the finest church of its size in the world. He has some of the finest farm buildings that any man possibly can have. So he is not pinching his tenants to build the church.

36,556. (*Mr. Lambert.*) Is that church intended to remedy the agricultural depression?—No, not to remedy agricultural depression; I say he is building this and he is remedying agricultural depression; he has not a single farm to let.

Condition in the Holderness district.

36,557. (*Mr. Chaplin.*) I think you told us there was a very different state of things in Holderness; that there is not the same demand for farm houses there?—No, some of the strong land farms there the landlords have to farm themselves.

Irish land laws.

36,558. As I understand there is no desire in your district for any new legislation in the nature of a land court?—No, I think not. There are a few, as I said, who say we ought to have an Irish land law, but I think they are the exceptions.

36,559. They are in a great minority?—A very great minority.

36,560. And they do not represent feeling or opinion in Yorkshire at all?—No, we do not believe in it. As I said, there is such an extremely good feeling between landlords and tenants that, in fact, many of the landlords would do very much more, but they are not able to do it.

Low prices.

36,561. Another reason, I think, you held out to us why they are taking farms occasionally now in the wolds is that there is a general impression that we have got to the end of the low prices?—That is a very general impression.

36,562. Is it the general view in your district that the fall in prices is the real cause of the depression and trouble?—Yes, I think that is the general impression, in fact, I have no doubt that is the great cause of it.

36,563. Now, supposing they are wrong in their general impression that we have got to the end of the fall in prices, and supposing that the fall in prices was to continue next year as it has continued into this year from last year, and many years before, what would be your view then as to the future of farming in Yorkshire?—I think many of the tenants who have been taking farms lately would very soon give up. There are men who would not care to lose money like some of the old-fashioned farmers. Men who had given up eight or ten years ago with a little capital are going back into farming now.

36,564. If that class of men you are now speaking of were to take that decision to give up the farms what would be the position?—I should think they could not be let at anything near the rent.

36,565. In fact, it would all go to ruin?—If the landlord takes a farm—a thousand acre farm—he gets no rent, and he is very likely out of pocket besides.

36,566. I have experienced that myself?—Many landlords have.

The Agricultural Holdings Act.

36,567. Would any alteration whatever of the Agricultural Holdings Act have any effect at all, in your opinion, upon the depression?—In my opinion it would not have the slightest, but some farmers think it would. The Agricultural Holdings Act is no use except in the case of a man leaving his farm; and they have generally good tenant rights.

36,568. Your object and my object, and the general object, of course, would be to help the people who are not leaving the farms, but who are staying in them?—Entirely, and every landlord is doing all that he possibly can to do that.

A large farmer in the Wold district.

36,569. Now, in answer to Mr. Clay you mentioned one farmer who you said was doing well; but I think you said that was an exceptionally good farm?—I did not say that he was doing well, but that he could nearly make ends meet.

36,570. But that was an exceptionally good farm?—We have many good large farmers, that is, tenants with

Mr. E. Riley. 29 Nov. 1894.

plenty of capital, who tell me that until last year they could just about make ends meet; but this year as I have said this farmer and others that I have mentioned say that they shall be half a year's rent out of pocket.

36,571. Even this year?—This year, the present year.

36,572. That is on a farm which is rather better than the average?—Yes, and which has been well farmed for the last 50 years, to my knowledge.

Uncultivated land.

36,573. Then I think I understood Mr. Clay to ask you whether it would not be better to let the land which did not pay—that is the more moderate land—go out of cultivation altogether; but is not that class of land a very large proportion of the whole?—The greater part of Yorkshire Wold land is very light soil, and it is only the high farming that keeps it up.

36,574. So if that view of Mr. Clay's was adopted it would mean that the greater part of the land in the Yorkshire wolds would go out of cultivation altogether?—I think a third of the Yorkshire wolds would go out of cultivation.

Land laid down to grass.

36,575 (*Mr. Clay.*) In the question I put to you I only suggested that if that land, the wold land, the sheep land, would not pay for cultivation, it might go to grass and then be managed at a moderate cost per acre, when it would pay a rent?—But then you see on the Yorkshire wolds you cannot get grass if you let it lie; it will do for two or three years, but after that it will scarcely keep a sheep an acre.

36,576. (*Mr. Chaplin.*) If the Yorkshire wold land, such as you describe and such as I am acquainted with myself, were treated in the way that was suggested by Mr. Clay, although it may stand for two or perhaps three years, it would be absolutely worthless afterwards?—After the third year it is worthless.

36,577. (*Mr. Clay.*) Would it be worthless as grass if you had taken to feed sheep on it?—They would not live upon it; you could not feed them upon it—what you feed them on would have to be carried to them.

36,578. Then I am mistaken in the kind of land that it is?—Yes. A great part of the wold land of Yorkshire is very much of that class when laid to grass.

Fall in prices.

36,579. (*Mr. Chaplin.*) Then you see nothing for it, I gather from your evidence, no hope of any real permanent improvement, unless the fall in prices is stopped by some means or other?—I do not see that there is any other chance I think they might be very much relieved by the burdens on land being removed. I live near Hull, where there are large importations of wheat.

Bi-metallism.

Bimetallism is a question I know little about except from reading, but a large importer of wheat told me the other day that he gets thousands of quarters from the Argentine. He says he sends a thousand sovereigns out there for wheat, and he can get 2,500*l.* worth of wheat back for it. That certainly must have a great effect on lowering prices.

36,580. That is not a question you have studied deeply yourself?—I have read a very great deal about it. I read your Chairman's speech to the Bradford Chamber of Commerce the other day three or four times over and he rather converted me; but then Sir William Houldsworth replied to him and I have studied it a great deal by reading, as I have plenty of time to read those things, and it has been very interesting——

36,581. You ended by taking Sir William Houldsworth's view?—I ended by taking his view again.

36,582. Having heard both sides of the question you became a strong bi-metallist?—I thought the Chairman was nearly as much a bi-metallist as Sir William Houldsworth was. There is the impression that it has a great deal to do with lowering prices.

36,583. That is an impression which is spread very widely in your district, is it not?—Very widely indeed—in fact I was asked to mention that particularly. I said, "Well, we have two such different bi-metallists "as Mr. Chaplin and the Chairman that it is a question "I dare not go into at all."

36,584. You have now fulfilled your mission and you tell the Commission that that is an opinion and a view of the position which is spreading very widely in Yorkshire?—Very widely indeed in Yorkshire. Another thing is spreading, and that is that options in wheat are considered to be a great means of reducing prices. We think in Yorkshire that if you can get 2,500*l.* worth of Argentine wheat for a thousand sovereigns coming into England it is bound to reduce the price of wheat here.

36,585. (*Mr. Dalton.*) Have you got much tithe in your district?—I do not think there is much tithe, but the landlord pays it now.

Mr. E. Riley. 29 Nov. 1894.

Tithe.

36,586. You do not know what it is an acre at all?—No, I think there is very little generally in our district.

Rates.

36,587. With reference to this urban district—you were speaking of Cottingham—has it been an urban district long?—I have only just come into the neighbourhood—that is, about seven years. It was so when I came into it, but how long before I do not know. Just lately they have been borrowing 20,000*l.* for this drainage.

36,588. You do not know what the rates in the £ are there, do you?—No, I did not care to go into figures. I thought you had heard so many figures that it was no use my going much into figures.

36,589. What remedy would you propose for such a case as you have mentioned, where they are paying urban rates three or four miles off?—I should take it entirely off the land; I would not have any of these rates.

36,590. Would you not have any rates at all on the land?—I would only have just the pure local rates.

36,591. Which do you consider the local rates—the rural?—Yes.

36,592. You would take the place out of the district, in fact?—I would take it out of the county altogether.

36,593. You would take it out of the urban district and put it into a rural parish?—Just the common rates that used to be prevalent 50 years ago.

36,594. The county council can take it out of the urban district, can they not?—I would take it entirely out, I would put it on the exchequer, and let everybody pay alike to it.

36,595. I am speaking of this urban place; you have a special grievance in one place, because a place which is four miles' distance from a town has to pay urban rates; cannot the county council remedy that by taking it out of the urban district and making it purely rural, when it would not have to contribute to town rates at all?—I do not think they would do it.

36,596. They have got full power, have they not?—I do not think they can do it very well; they have the power. The farmer I was speaking of just now has decided to leave his farm—he has a little money left, and he says the sooner he is out of it the better.

36,597. (*Mr. Long.*) What Mr. Dalton means by his question is this: have not the county council got the power under the Act of 1888 to re-arrange the urban district and take out these rural places—these farms?—Yes, they have power.

36,598. They have the power: that, of course, we know?—Yes.

36,599. But would you say that it would be a practical impossibility for them to do anything of the kind?—I should say so.

36,600. The local opposition would be so strong on the part of the urban place?—It is really in the parish; I do not think that you can well take it out.

36,601. (*Mr. Dalton.*) But they can alter the area?—They can alter the area, but I do not think the county council would ever think of doing such a thing.

36,602. Urban areas have been altered very considerably by county councils in most parts of the country; there is a great difficulty in altering a borough, but is there any difficulty in altering such a district as Cottingham?—They have got one altered. They have done away with South Cave.

36,603. Was that done by the county council?—Yes.

36,604. Then they can do it?—Yes; there is no question that they can do it, and that they can create a new one.

36,605. That is the right way of dealing with that particular grievance, is it not?—Yes, but then what chance has a farmer to go and get it done.

36,606. I suppose it is not only one farmer who is these four miles off—I suppose there is a good deal of land in question?—A good deal of the land is accommodation land. Cottingham is a place that supplies Hull with vegetables.

36,607. I thought the place was four miles off a town?—This particular farm is four miles off.

Mr. E. Riley. 29 Nov. 1894.

36,608. (*Mr. Little.*) Would it not be the case that there would be perhaps 400 people whose interest it was to keep the land in the urban district, and only four or five whose interest it was to take it out?—Yes.

36,609. (*Mr. Dalton.*) Would the town gain much by taking a farm of that kind in?—They do not care to have anything taken from them.

36,610. But no attempt has been made to do it?—No attempt has been made to do it, and I do not see how you could do it.

36,611. (*Mr. Long.*) You said it had been done in a particular case, but I did not catch the name?—There is one which has been done away with. It is South Cave.

36,612. South Cave was under an urban authority, and that has been done away with?—Yes.

36,613. But that is a totally different case from what Mr. Dalton suggested to you, namely, that a particular part should be taken out of an existing urban authority?—It is a very different thing.

36,614. In the case of an urban authority extending, as they frequently do, and as they appear to do in this instance, into what is practically a rural district, is it a practical impossibility for the county council, being an elected authority, to take the rural district out?—I should say it would be rather difficult for them to do so, especially as it has been created, I should think, some years now. The other that I speak of that is done away with is within 15 miles.

36,615. That is a totally different thing; abolishing an urban district altogether and taking out certain portions of a district are two different things?—Yes, it was purely an agricultural district, and therefore they have done away with it.

36,616. (*Mr. Dalton.*) I suppose when the district was originally formed, it was by the ratepayers of the whole of the parish adopting the Act?—Yes, they would adopt the Act.

36,617. They were able to do that a great many years ago, but they can do it no longer now. They have to get the sanction of the county council now, and in case of appeal, of the Local Government Board before they can form such a district?—We wanted to form an urban district council in Hessle, which is a suburb of Hull, and they would not allow us.

Light railways.

36,618. (*Mr. Channing.*) I see you have mentioned light railways in your brief; have you any practical knowledge of any experiments in that way?—There is a friend of mine who has gone very greatly into it, that is Mr. Hall, of Darlington. In many of the districts it would be a very great advantage. His is a very simple method, and I have advised him to bring it before the Conference, which is being called by the Board of Trade.

36,619. You have no personal knowledge of it yourself?—No, I have no personal knowledge of it. I know it is thought to be a very great advantage in many districts.

Rates.

36,620. (*Mr. Elton.*) Did I understand you to express an opinion that a county council could alter its area in order to relieve someone of the rates?—I do not know about relieving someone, but they have power to alter the area.

36,621. They have under certain circumstances?—Yes, under certain circumstances.

36,622. Either your answer was not practical or you seemed to imply that the area could be altered for the purpose of relieving a portion of the district of the rates?—No, I did not intend that. I say that they have the power, but I do not think that any single farmer would be listened to if he were to ask for an alteration so that he could be relieved from the rates.

36,623. Is it not going rather beyond your real scope to say that they have the power to do it?—I believe they have the power.

36,624. Have you considered the subject whether a County Council could do it for any reason that might be suggested to them?—I do not know what reasons they have, but I know that they have the power.

36,625. We know they have the power in certain cases, but I want to get this clear on the notes. Do you or not, express the opinion on the legal point that they could do it with a view to relieving certain persons of the rates?—I do not think they would do it to relieve this farm that I speak about.

36,626. You say they would not do it, but do you wish to have it on our notes that your opinion is that they could do it for that purpose?—I do not know what purposes they can do it for.

Mr. E. Riley. 29 Nov. 1894.

36,627. I know you do not, but do you wish to express that legal opinion?—No, I do not wish to.

36,628. I thought you admitted rather too much to the honourable gentleman?—I say I do not think they would.

36,629. (*Mr. Long.*) The county council have power for any reason; the county council are not bound to give their reason, are they?—No.

36,630. (*Mr. Elton.*) I do not wish it to go down on the notes, that it is the rule that they would do it for that object?—I do not think they would do it in this case for a moment, but I think they have power to do a very great deal.

Restriction on cultivation.

36,631. Now about the restrictions: I think you said first that you would not have any restrictions?—I would not have any.

36,632. Then you at once remembered a very strong restriction that you would always have about replacing the manurial value of the straw taken away?—Yes, as long as we have that restriction. It is a benefit to a farmer to farm well, and a good farmer would always replace manurial value. I say the land agent is the proper man to see whether a man is farming well, and if he does not farm well, let him go.

36,633. What I understood you would wish to be in the agreement is that if the straw was taken away there should be a replacement of manurial value?—That is if there be restrictions, but I say I would rather not have any.

36,634. Would you let him sell it without making any provision for replacing it?—I certainly would prefer no restrictions.

36,635. I suppose so far as your experience goes there always have been some restrictions?—Yes, there always have been some restrictions? In my own case I farmed a farm for 50 years, and my agent told me as long as you farm as you are you can practically do as you like; but he said if you are leaving your farm, you must leave it according to the agreement.

36,636. I am only getting your answer clear. You said, I think, that the farmers preferred these agreements without restrictions?—Yes.

36,637. Have you ever seen one without restrictions?—No, I have not seen one.

36,638. Have the other farmers?—I scarcely think there is such an one without restrictions now; I say I do not see why a farmer ought to be restricted. I think that farming now is on a different footing altogether to what it was when those restrictions were put on. I think a farmer ought to be at liberty to crop and do anything he likes.

36,639. I am not dissenting from your view at all. I am only trying to get it clear?—That is my decided opinion.

Railway rates.

36,640. (*Viscount Cobham.*) I think you wish to add something about railway rates?—Yes, they are bitterly complained about, especially in regard to the advantages given to foreign products and the charges on small parcels, say, of butter, poultry, fruit, bacon, &c. I cut a piece out of the paper yesterday, as I came up, referring to some action which was brought by the Mansion House Committee, where there was 17*s.* 11*d.* a ton charged from Southampton for English produce, and 6*s.* for foreign.

36,641. (*Mr. Lambert.*) Is that authentic?—I have the paragraph here.

36,642. Can you vouch for this yourself?—I cannot vouch for it. That is what I cut out of the "Yorkshire Post," and we consider that a very good authority in Yorkshire.

36,643. (*Viscount Cobham.*) You have seen it stated that that was the case?—Yes, I just cut this out of the paper as I came up to London yesterday. I generally get a flour barrel with eight stone of apples from my old landlord, and the railway company charge me 1*s.* 6*d.* for that just for carrying it some few miles. In some years that is nearly the price of the apples. We want some cheaper means of conveying the produce.

35,644. Such as light railways, or some such things?—Yes. In many parts they convey for as much a ton as you get for a hundredweight here.

The witness withdrew.

Mr. T. Duckham. 29 Nov. 1894.

Mr. Thomas Duckham, called and examined.

36,645. (*Viscount Cobham.*) I think you were Member of Parliament for Herefordshire for some time, were you not?—For seven sessions.

36,646. You were a tenant farmer in that county?—Yes.

36,647. But you gave up farming in 1889?—Yes.

36,648. Are you a Trustee of the Smithfield Club and Member of the Council of the Royal Agricultural Benevolent Institution?—Yes.

Depression in Herefordshire.

36,649. What is the extent of agricultural depression in Herefordshire at present?—It is not so severe in Herefordshire as in some other counties.

36,650. To what do you attribute that?—The crops are more varied in Herefordshire. It is very severe upon certain parts of the county, but there is a considerable area where hops are grown in the county and a great deal of fruit. Those things come in, and assist very materially.

36,651. There is a good deal of grass upon most of the farms, is there not?—Yes.

Reduction of rents.

36,652. Comparing rents now with the rents paid 15 or 16 years ago, how do they stand?—Upon the hoplands and first-class grass lands there is very little alteration, but upon the second and third-class lands there is a very great alteration.

36,653. How much reduction would there be?—Upon the second-class land fully 20 per cent., and upon the other 30 per cent. or more.

Farmers' capital.

36,654. Have farmers lost their capital to any great extent?—Very seriously.

36,655. Would you say that a good many have gone, with very little of their capital left?—Yes, a great many of them have become bankrupt.

36,656. Has there been a considerable change of farm tenants?—Yes, there has. Several farmers who invested capital in the purchase of farms, borrowing on mortgage that which they were short of, have lost their all.

Deteriorated farming.

36,657. As the result of the depression has farming deteriorated a good deal?—Yes.

36,658. Is there less labour employed?—Yes, there is no means to pay them.

36,659. And less manure and less feeding stuff given?—Certainly.

Foreign competition.

36,660. To what do you attribute this agricultural depression?—Unquestionally to foreign competition.

36,661. To low prices caused by foreign competition?—No question of it, I think.

36,662. As to that, do you see any prospect of improvement or any remedies that could be applied?—The only substantial remedy that I see is in the question of local taxation.

36,663. I mean with regard to foreign competition you do not think that anything can be done there?—No.

Local burdens.

36,664. But you do think that the farmer should be relieved of some of the burden of local taxation?—I do.

36,665. Are your rates on the increase or on the decrease in Herefordshire?—They have increased.

36,666. Could you give us the figures for any two periods?—No, I cannot, except upon the question of the highways; I have not got the other figures.

High road rates.

36,667. Whatever increase there has been has been mainly due to the main roads, is that so?—Yes it is. I have been sadly afflicted from accident the last seven weeks and I have not got all the figures with me. There are 439 miles of main roads in the county, and the cost for 10 years averaged 14,926*l.*; for the three succeeding years the average was 16,125*l.*; for last year it was 19,055*l.*, and for this year 19,049*l*; that is an increase of between 4,000*l.* and 5,000*l.*

36,668. Do you attribute that to the establishment of county councils and to the new administration?—No, I do not.

36,669. Are the roads better?—The roads are improved, but the roads have been kept well for a great many years, in fact, the first three years after the Highway Act came into operation establishing main roads, Mr. Coddrington, C.E., was surveyor of the main roads in the county.

36,670. You think the increase in the rate for roads has been partly accounted for by the improved condition of the roads and partly by the change in administration?—Yes.

36,671. Have your other rates been much increased?—Really I cannot tell you.

36,672. Has the whole amount that you pay under the head of rates increased?—I have not any figures of that sort.

36,673. Whether it has increased or not you think the burden upon land is much too heavy?—Certainly.

36,674. How would you remedy that?—I feel that it is most iniquitions that the whole burden of local taxation should be placed upon real property. I think it bears hard upon the urban population as well as upon the rural population, and that it bears very severely upon the struggling tradesmen, mechanics, and others.

36,675. The owners of house property?—Yes.

Rating of personal property.

36,676. Have you any definite suggestion to make how you would shift the burden?—My opinion is that all personal property should be brought in to contribute to the local rates. Personal property and real property now by the death duties are placed upon an equality, and I think you should no longer exempt personal property from the burden which under the Act of Elizabeth was placed upon real and personal property.

Rating of woods.

36,677. Then I understand that you consider that the law as to the rating of woods has added to the burden placed upon the agricultural interest?—Yes, in my county.

36,678. How does the rating of woods affect the farmers?—We have nearly 40,000 acres of woods in the county. My friend Mr. Clare Sewell Read and others pressed for an alteration in the rating of wood lands; we felt that the heavy timber as well as the underwood should be brought in to contribute towards the rates, and an Act was passed, as it was considered at that time to meet that exemption that we felt ought not to exist upon the heavy timber. The effect of that Act was that the proprietors of the woods appealed against the rates and reduced them in many cases 50 per cent.

36,679. Then your complaint is that the woods are not rated sufficiently high?—Certainly.

36,680. (*Mr. Channing.*) The heavy timber, you mean?—Yes, it does not contribute at all.

36,681. (*Viscount Cobham.*) On what ground was the assessment reduced?—The ground was that it should be reduced to the value of the land in its unimproved state, supposing the whole of it was cleared of the timber and underwood and left with the stumps of the trees on the surface.

36,682. Was that laid down as the law?—Yes.

36,683. On the other hand you complain of the damage done to the roads by the removal of timber?—Yes.

36,684. That was intended to be met, I think, by legislation as to Extraordinary Traffic?—Yes, it was intended to be met by that Act, but it has not been met by it. As soon as that Act was passed a timber haulier was summoned for extraordinary traffic, and he was mulcted in nearly 100*l.* damages; but they found he had not got 100*l.* to produce, and therefore that fell through; they could not recover.

36,685. Then it was not the fault of the law?—No. Then the timber merchants were summoned, and the timber merchants paid, I believe. Colonel Decie, who is the Chairman of the County Council, gave evidence the same time as myself before the Select Committee of the House of Lords upon the Highways, and I think he said in one case there was a tree removed in his district, where he was chairman of the highway board—a very large one, of course—and the damage was 60*l.* The timber merchants felt that it was rather an awkward position to place them in, and they combined not to buy unless the damage was guaranteed to them by the vendor. Then there was a test case at Raglan, that is on the borders of the county of Hereford; it is a highway district in Monmouthshire. In that district there is a large quantity of coppice wood belonging to the Duke of Beaufort. This test case was made. The highway board claimed so much damages to the roads, and it was tried in the Court of Queen's Bench. The

board was beaten, and beaten in this way: the wood that had been removed over these roads, and which had done the damage, was shown to be something between 15 and 20 years' growth. It was simply coppice wood, consequently a crop, and the owner had as great a right to move that crop as a man would have a right to move a crop of wheat. It was shown to be a crop of the district. That, of course, is a very different matter to timber varying from 50 to 100 years' growth.

36,686. Then the highway boards have no remedy?—No. Being beaten at Raglan they do not like to touch the question again, and thus it is that there has not been any compensation, although it has been a burning question with the ratepayers for many years.

36,687. Do you think that compensation should be given for damage by the removal of coppice wood as well as of timber?—They pay for the underwood, and they pay for the lighter growth. Underwood is rated under the Act of Elizabeth.

36,688–90. I am referring to the damage to the roads in the removal of coppice wood. Do you say that coppice wood does not pay for the damage done to the roads?—Yes. It is the large timber that I am speaking of; that does not pay anything, and that does not pay rates. There is the grievance. There are immense trees grown in the hedgerows, and they detract very greatly from the land upon which they grow.

36,691. It pays death duties, does it not?—Yes, I suppose it would, but that does not assist the local ratepayer. I know a case where a man offered 10*s.* an acre more for the farm if the landlord would fall the timber in his hedgerows, and he would not do it.

Assessment to rates.

36,692. Have the farmers got the benefit of the reduction of rents in their assessments?—I think they have. The matter of returning of 20, 30, and 50 per cent., as we sometimes see, is not practised in my county, but I think they have a substantial reduction as far as they have gone.

36,693. Notwithstanding that, the total amount of rate paid you consider has not diminished, at all events in Herefordshire?—No; the total amount of rate paid is equal to what it was, or more than it was; in the case of the roads it is certainly more.

Local burdens.

36,694. Do you think that the burden of local taxation has had a very considerable effect in aggravating the depression of agriculture?—Yes, I do.

36,695. Do you think it makes the difference between farms being taken or not taken?—Yes.

36,696–7. In fact, it is a factor in the depopulation of the rural districts which is going on?—Certainly.

Farmers' capital.

36,698. (*Lord Rendel.*) You say there is a great depletion of farming capital in your county, I think?—Yes.

36,699. Do you not think there is a corresponding loss of farming enterprise and energy?—If men cannot make their occupation profitable it certainly damps their energy very considerably. We have the same men, to a considerable extent, but a great many left when the depression commenced.

Rural depopulation.

36,700. Do you think it also amounts to reducing the available farming population—the class from which the occupiers of land come?—Yes.

36,701. You think that has been substantially diminished in your county?—Certainly; in fact the returns show it.

36,702. Does the diminution apply to the labourer as well as to the actual tenant-farmer?—Yes, it applies to both—more to the labourers than to the farmers.

36,703. In fact, the mischief you think has gone very far indeed?—Yes.

36,704. It would be a very serious business to restore the enterprise, the capital, and the population?—Yes.

36,705. Probably beyond the reach of any legislation?—I do not know how legislation is to do it in any other direction than those I have mentioned.

36,706. With your long experience of the important and representative duties you for a long time so well fulfilled, do you regard the condition in your neighbourhood as one of very grave and permanent exhaustion?—Yes, I do.

36,707. Both of capital, of energy, and of population?—Yes.

High road rate.

36,708. Now, about the roads, have you ever considered any question of the advisability of discriminating between the different characters of roads as is usually done on the Continent?—Yes.

36,709. All main roads are commonly rated, I suppose?—They are all rated, but I have felt from the very first very strongly opposed to two classes of roads. I have felt that the ratepayers should have good roads, and that all roads should be kept up to a good standard.

36,710. Have you yourself any opinion, or do you think there is an opinion in your neighbourhood in favour of making the arterial roads, the principal roads, supported out of Imperial taxation, and only the subordinate roads supported out of rates?—They are so now. There, I think, is a great grievance. You see there are considerable mileages in certain highway districts which are made main roads, and they take a portion of the grant from the Imperial funds. Where there is a greater proportion of main roads in one highway district than in another, the highway district that has the lesser quantity has to maintain all its roads, and to contribute towards the main roads of the other district. The principle appears to be right on the face of it, but I think when you come to consider that a main road is contiguous to a railway station or contiguous to a town there are advantages attendant upon the occupiers of the land and houses in those immediate districts, which more than counterbalance the advantage which a man derives by driving over the road when he occasionally wants to go to the station or to the town. In the one case a man who has been travelling by rail at once reaches his home; he either goes into his business or into his house upon his arrival; the poor fellow who lives seven or eight miles away must drive over a length of road, very often very bad, before he can reach his home, yet he has to pay the same proportion for the maintenance of that road that the other, the more fortunate man, has derived the benefit of.

36,711. Then with regard to the maintenance of the roads generally you said that there is a substantial inequality in the burden which is unfavourable to the rural districts?—Yes.

36,712. (*Mr. Little.*) I did not quite understand you—did you say that the main roads were now paid for out of the Imperial funds?—A certain proportion, you know.

36,713. But there is no specific grant from Imperial taxation for the roads?—It goes to the General Purposes Fund of the County Council.

36,714. At the time the change was made the county justices were receiving from the Treasury a contribution towards the cost of main roads?—Yes.

36,715. And that was one-half the expenditure of the previous year, was it not?—Yes.

36,716. And subsequently another fourth was added making three-fourths altogether?—No, I think you are wrong there. It was in this way: Colonel Harcourt and myself pressed it very heavily upon Mr. Gladstone and he granted, I think, 125,000*l.* the first year. Then the next year it was one-fourth of the cost of the main roads and that was granted to the highway districts; then subsequently there was another fourth of the main roads granted from the National Exchequer, but that was granted to the county authorities and not to the highway districts.

36,717. Then assuming that the present Treasury subvention is equal to what was being paid out of the Treasury for local purposes you are now getting from the Treasury one-half the former cost of main roads, if they are paying on the basis of their former payments?—Yes, I think we are.

36,718. And the other half is provided by the local ratepayers?—Yes.

36,719. You say that many of those who contribute on equal terms do not enjoy the advantage of the main roads to the same extent as those who live close to?—Just so.

36,720. But they use the roads, or may use them?—Of course they use them.

36,721. The ground of the charge being extended over a larger area is that a larger number of people use the roads than those immediately adjoining them?—It is not extended over a greater area.

36,722. The charge for the main road extends over the area of the whole county, does it not?—Yes.

36,723. You told us that your main roads had increased in cost very much. For the first period you

Mr. T. Duckham. 29 Nov. 1894.

gave us 14,926*l.*, in what years was that?—That was the average of the 10 years, 1879 to 1889.

36,724. Had it been a growing charge; you say it is an average of 10 years; what was it in the first of those 10?—I have not got the figures for 1879.

36,725. Is it your impression that the cost had been growing up to the time that you have taken, to the end of the 10 years?—No, it had not; but from 1889 to 1892 it was 16,125*l.*

36,726. And now it is 19,049*l.*?—Yes.

36,727. Is that for the same mileage?—No; it is not for the same mileage, it is for 466 miles against 439.

36,728. Then you have additional main roads?—Yes.

36,729. May I ask if you have had any exceptional expenditure in respect of footways by the side of main roads?—No, we have not.

36,730. You have to pay for them in towns?—There was always a little done by the side of the road.

36,731. Footways in towns in front of houses were never paid for before, were they? I mean under the turnpike trustees?—No. That has been a source of a considerable amount of litigation. We have had different appeals. The figures I have given you do not refer to the urban roads.

36,732. This is the case of main roads in rural districts alone then?—Yes.

36,733. What is your proposition then for equalising or removing this unfair tax for highway purposes; have you a remedy?—My opinion is that it should fall upon the county rate.

36,734. The whole of the roads?—The whole; so that all ratepayers should take an equal benefit of the amount received from the National Exchequer.

36,735. Do you think it would be fair for a village road which accommodates only the people of that village, and is never used by any others to be paid for by the county in the same way as a road which is used by many different parishes?—The roads in the villages are now.

36,736. That may be, or may not be; but if you take in all roads you would certainly take some roads which are mere occupation roads, and yet are public roads; I mean roads used only by a few occupiers. (*Mr. Channing.*) They are also used by the brewers and general tradesmen carrying goods to the occupiers, are they not?—The occupation roads do not come upon the rates at all.

36,737. (*Mr. Little.*) I am imagining a road such as I find in my own county which is a public road, and is repaired out of the public rates, but is used almost entirely by a few occupiers of land; it is a *cul de sac*, and there is no through traffic. Would you think it fair that that road should be paid for out of the county rate?—Yes, because it would all come upon an average.

36,738. (*Mr. Elton.*) I suppose the old practice for hundreds of years was that the county rate should pay for roads without making any distinction whether they are highways of a limited character or highways of a main road?—You are quite wrong there.

36,739. I am only asking you to tell me what it was?—They were maintained by the parishes, not by the county.

36,740. When there was prescription it would be by tenure?—They were all parish roads, and there was the parish surveyor.

36,741. When I said the county rate I put it too compendiously. I meant there was a real *trinoda necessitas*, which was that the land-owning public should pay for roads, bridges, and certain other things, and in some cases that was met certainly for a long period by the county rate; in others it was done by arrangement by tenure, and in others it was the parish who attended to it; the idea was that the land paid for every class of highway; is that correct?—Yes, but it did not come upon the county.

36,742. I put it in the more expanded form. What I meant was, the land in the county?—Yes.

36,743. What I was intending to say was that the whole land of the county paid for the roads without making a distinction?—Yes.

36,744. The land met the expenses of the high roads on the same principle as it met the expenses of the bridges, without drawing distinctions between the main roads and the more limited occupations, or limited high roads?—There was no distinction; the distinction arose when the turnpike gates were established. Of course, we know that the turnpike gates had but a short existence.

Mr. T. Duckham. 29 Nov. 1894.

36,745. About the Act of Elizabeth; of course, it is as you say about the paying of the poor rate under the Act of Elizabeth, but did not that Act leave an opening for its being put on personalty, too?—According to the wording of that Act they were to pay according to ability.

36,746. Certain kinds of personalty were included as well as realty in the purview of that Act, were they not?—Yes. To pay according to ability.

36,747. That principle of enlarging the purview of the Act has been carried out, to some extent, in our own time, has it not, as in the case of the profits on mines being charged to the poor rate?—Yes.

36,748. You would wish to see that sort of principle adopted very much more fully—you would wish to see it applied to other kinds of personalty?—Yes.

Rating of woods.

36,749. About the rating of timber trees that you were speaking of, did I understand that you wished them to be rated as growing, or when they are sowed?—When they are felled.

36,750. A charge made when they are felled?—Yes. I think myself that the party about to make a heavy fall of timber should make an arrangement with the surveyor of the roads and give compensation, otherwise it becomes a very cruel case. In my county there are very heavy falls of heavy timber, 5,000*l.* or 6,000*l.*, or up to 10,000*l.* or 11,000*l.* worth at a fall, and when that is removed it is a very serious matter for the roads. It renders the parish roads, which are not kept so sound and good as the main roads, unpassable, and, of course, it wears out the main road very seriously. When we talk about the increase in these claims from the different highway districts we are told, "Oh, we have "got such a fall of timber; we have got 200*l.* or 300*l.* "to pay for that," and so on.

High road rate.

36,751. (*Mr. Channing.*) About the roads and the payment for the roads; is it your contention that the Act of 1888 and the recent Act have left things in a position in which certain districts suffer more proportionately and bear a heavier proportion of the burdens of maintaining the roads than they did before those Acts, in practice I mean?—Yes. What I contend is that the Act of 1888 gives a sum in aid for the general purposes, and main roads is the principle matter that falls upon that. Those that have a large mileage of main roads through their district in proportion to the mileage of district roads have got a great advantage; so much so, that if you look in the local taxation returns you will find that there are some highway districts paying about 2*d.* in the £ rate, whilst others are paying 10*d.* and 1*s.* in the same immediate district.

36,752. That is the experience we have in Northamptonshire, and that you say is your experience in Herefordshire?—Just so.

36,753. Would you advise any legislation then to compel the authorities to adopt some uniform system which would equalise the burden, or what is your suggestion?—My suggestion is that it should fall upon the county rates.

36,754. Would you make that by general legislation, or would you leave it to the authorities to adjust?—You cannot do it without general legislation.

36,755. You think the elastic provisions of these two Acts are not likely to work satisfactorily then in settling this question?—Yes.

36,756. But they have worked satisfactorily so far?—It is not satisfactory when one neighbour sees that his next-door neighbour, so to speak, is deriving a much greater benefit than he does from the National Exchequer.

Division of rates between owner and occupier.

36,757. Do you think that the division of rates between owner and occupier is a question that should be pressed?—I have heard a great deal upon that matter. The rates fall upon the owner now, but, of course, during the occupation of a tenant he pays the rates, and pays for any increase of rates that comes upon him during his occupation. I thought years ago when we had so many changes and additional rates placed upon the ratepayer that if it fell upon the owners they would be a little more careful. I think they have now become alive to the position, and they are not likely to charge us with any additional burden.

36,758. About the permanent reductions of rent: you say there have been permanent reductions of rent as I understood you?—Yes.

Reduction of rent.

36,759. Have those been sufficient in most cases to put upon the landlord's shoulders the burden of all these rates which you say have increased?—Of course they could take the burden of the rates, but you know there is the depreciation in the value of the produce. That is the trouble. The depreciation in the value of the produce is so great that it is impossible for them to pay their way upon much of the land.

36,760. If the reductions of rent have not been very heavy, part of the burden of the rates, especially these new rates, would still rest upon the tenant, would it not?—Yes.

36,761. How far would you consider the reductions of rent in Herefordshire correspond with the tenants' losses from the fall of prices?—There is a great deal of the land in Herefordshire that is not worth anything more than the rates and taxes.

36,762. But it is let for something more than that, is it not?—Yes, when they can get it.

Rent of orchards.

36,763. I do not think you said anything about land used for fruit trees. Has the rent of that gone down very largely?—No. If you remember, I think I referred to hops and fruit. There are 26,435 acres of orcharding in the county.

36,764. The rent of that has not gone down very seriously?—No, not so seriously as the other.

Hop-growing.

36,765. Has the area under hops increased lately or decreased?—It has slightly increased, I think.

36,766. And the hop-growers are in a less depressed frame of mind than they were three years ago?—Yes. This has been a bad year for hops, but last year was very fair. This year the crop was light and the price was very bad.

Dairying.

36,767. Have you made any attempt in Herefordshire at co-operation in dairy farming or any other form of farming?—There has been nothing of the kind, in fact it is not a dairy county. The soil of Herefordshire is not adapted for dairying as are many other counties. There is a well-known absence of phosphates in the soil which is not favourable to dairying.

High road rate.

36,768. (*Mr. Dalton.*) I think you said that your main roads increased from 439 miles in 1889 to 466 in 1894?—Yes.

36,769. I find the average cost of keeping them up to be about 40*l.* per mile taking them for the whole county at the present time?—The average of the highway districts is 40*l.* 16*s.* 11*d.*, and for the county, that is including the urban districts, 46*l.*

36,770. That would account for rather more than 1,000*l.* increase out of the 4,000*l.* increase that you gave us between the periods?—Yes.

36,771. Then there was an additional 3,000*l.* of expenditure on main roads in the rural districts since the passing of the Local Goverment Act, or perhaps not quite so much?—Yes.

36,772. Can you say what the addition was in the urban districts?—Yes.

36,773. What was the addition then—did that come to 1,000*l.*?—The average expenditure for the 10 years was 874*l.*, but Hereford being a corporate city and the roads being disturnpiked previous to the Act coming into operation, Hereford derived no benefit from the alteration of the law until the County Council came into operation. Then the cost was 3,334*l.* for the first year.

36,774. What is it now?—4,155*l.*

36,775. As compared with 874*l.* previously?—Yes, but you see that omitted the city of Hereford.

36,776. At the utmost this would come to something under 2*d.* in the £ for the whole county in addition, supposing the whole of it fell upon the rates, but as a matter of fact you got very large additional Government subventions and did they not cover that 2*d.*? You had half the cost of the main roads prior to the passing of the Act of 1888; you then got that money handed over to you and a very large surplus besides?—Yes.

36,777. What I want to know is, would that surplus cover this additional cost which comes to the 2*d.*?—Yes, it did.

36,778. Then that ought not to have caused your rates to be increased now as compared with 1889. This, I understand, is the rate of which most complaint is made; you complain that the rates have risen very much, but I do not at present see how this particular rate can have increased at all; at any rate the extent to which it has increased must be very small?—The other roads are very much increased.

36,779. The highway rate must have been reduced by taking these 29 miles off from the highway authorities and letting them go on to the county; you must have relieved the highway ratepayers of 29 miles of road?—Yes, in certain districts; that is what I say. Those districts have been relieved to the disadvantage of other districts which have not so great a mileage in proportion to their district roads.

Rating of woods.

36,780. The assessment on timber is a very difficult question, is it not?—It is.

36,781. Is it not very difficult to put an annual value upon woods consisting mainly of timber from which you get no regular annual value—is that not a difficulty?—There is a difficulty there, no doubt.

36,782. How would you assess it? You may not cut the tree for a hundred years afterwards, and you would not wish a man to be paying rates on it the whole time?—No; but when the trees are cut there should be some compensation for damage.

36,783. But you could not assess them in the ordinary way?—If you were to come into the country and build a mansion, the highway boards would call upon you for something for extraordinary traffic, although you would be increasing the rateable value of the district by the mansion that you build; but if the timber is felled, as I said, it does an enormous amount of damage, and they sometimes bring 8,000*l.* or 10,000*l.* worth of timber over the roads without compensation for damage.

36,784. I am not saying there is not a grievance, but how would you meet it, would you deal with it in the same way that you do with saleable underwoods? You take an average value for your saleable underwoods in assessing them, do you not, for a given number of years?—Yes.

36,785. If you have extensive woods, cannot you do something of the same kind or is the timber not cut down with any regularity at all?—It is not cut down with any regularity at all. There has been a regular slaughter amongst it of late years and it looks as though the county would be divested of timber.

36,786. Then the grievance would disappear?—The grievance would disappear when it is, but it is a very great grievance now. I am sure you can see it.

36,787. But there is a great difficulty in dealing with it?—I know there is.

(*See* letter addressed by the witness to the Commissioners, supplementary to his evidence. Appendix VI.)

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Sixty-seventh Day.

Friday, 30th November 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. Baron RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLOCK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.

ALAN M. MACKINNON, Esq., } *Secretaries.*

Mr. T. H. Elliott.
30 Nov. 1894.

Mr. THOMAS HENRY ELLIOTT called and examined.

Mr. T. H. Elliott.
30 Nov. 1894.

36,788. (*Chairman.*) You are the permanent secretary to the Board of Agriculture?—Yes.

36,789. You have held that post since January 1892?—Yes.

36,790. And previous to that time you held other posts in the Civil Service?—That is so.

Constitution and powers of Board of Agriculture.

36,791. The Board of Agriculture was constituted by an Act which passed in 1889, and which received the Royal assent in August of that year?—Yes, I put in a copy of that Act (*handing in the same*).

36,792. And the Board has been in existence about five years?—Yes.

36,793. Will you state what powers the Board took over immediately on its constitution?—In the first place, the Board took over the powers and duties of the Privy Council under the Contagious Diseases (Animals) Acts, consolidated last session under the title of the Diseases of Animals Act, and under the Destructive Insects Act of 1877, an Act specially directed against the Colorado beetle. Then in the second place, the Board took over the powers and duties of the Land Commission under the Tithe and other kindred Acts, the Copyhold Acts, consolidated last session under the title of the Copyhold Act, the Inclosure of Commons and Allotments Act, the Metropolitan Commons Acts, the Drainage and Improvement of Land Acts, the Land Drainage and certain miscellaneous Drainage Acts, the Universities and College Estates Acts, the Conveyancing and Law of Property Act, the Settled Land Acts, the Agricultural Holdings Acts, and the Glebe Land Act. Then in the third place, the Board took over the powers and duties of the Office of Works in regard to the Ordnance Survey. Those were all powers and duties pre-existing in other Government Departments. Then in addition the Board were empowered to undertake certain other things.

36,794. Empowered by the Act of 1889?—Yes, the Board were empowered by that Act to undertake the collection and preparation of statistics relating to agriculture and forestry, to inspect and aid any schools, not being public elementary schools, in which technical instruction is given in any matter relating to agriculture or forestry; and to make or aid such inquiries, experiments, and research, and to collect such information as the Board might think important for the promotion of agriculture or forestry.

36,795. Well, then since the Act of 1889, other duties have devolved upon the Board under more recent Acts?—Yes, I may especially mention the Markets and Fairs (Weighing of Cattle) Act, the Fertilizers and Feeding Stuffs Act, and the Merchandise Marks (Prosecutions) Act. The Board have also taken over from the Board of Trade the duty of collecting and publishing the corn returns.

36,796. (*Mr. Giffen.*) Will you mention that you collect the corn returns also under the authority of a Special Act of Parliament?—Yes, under the same Act of Parliament as the returns were collected by the Board of Trade.

36,797. The Corn Returns Act of 1882?—Yes, the Corn Returns Act of 1882, but the actual business of collection was transferred by an Order in Council from the Board of Trade to the Board of Agriculture in 1890.

Division of work of the Board.

36,798. (*Chairman.*) Will you state how the work of the Board is divided for the purpose of administration?—The greater part of the work of the Board is divided for convenience of administration into three divisions: the Intelligence Division, the Animals Division, and the Land Division, and these Divisions, of course, again into certain distinct branches. I think it may be convenient to the Commission if I take up the various subjects on which evidence is to be given on behalf of the Board, according to the particular Division into which the matters fall. I propose, therefore, with your permission, to refer in the first instance to the Intelligence Division, which comprises three distinct branches, viz., the Statistical, Intelligence, and Educational branches.

Duties of the statistical branch.

36,799. Will you describe the duties of the Statistical branch?—The most important work which falls within the purview of the Statistical Branch is the collection and publication of the annual agricultural and produce returns. The agricultural returns are collected by the Inland Revenue officers from the occupiers of land in the month of June of each year, and reach the department about the last week in July. A summary of many of the principal items is compiled and published during August. An abstract of the returns showing particulars for each division of the United Kingdom, and each county in Great Britain, is issued about October, and the final details, with a general report, are subsequently published.

Collection and publication of agricultural and produce returns.

36,800. (*Mr. Giffen.*) Might I ask whether the Inland Revenue officers do any work in preparing this statistical volume?—Yes, they do a great deal of the preliminary work, and they make an examination of the returns rendered by the occupiers. The results obtained are subsequently examined by the officers of the Board of Agriculture. Then, as regards the produce returns, the officers of the Inland Revenue also collect the information necessary for those returns. They employ persons in each district competent to estimate the average yield per acre of the crops. These persons are usually land agents and valuers, farmers, corn traders, &c. About 250 estimators are there employed, and, as a general rule, separate estimates are made in each parish, the number of separate reports upon which the produce returns for 1893 were based being 13,356. The estimators are paid a fee for their services, a sum of 3,100*l.* being voted for the purpose for the current year, 1894–5. A detailed account of the mode in which these statistics are collected and compiled is contained in the report which accompanied them in 1890. I should like to state, both with regard to the agricultural returns and the produce returns, that much has been done in recent years to improve and

Mr. T. H. Elliott.
30 Nov. 1894.

simplify them, and to accelerate the publication of the various details. It may be useful to the Commission if I put in a memorandum which has been prepared, showing in detail the changes made in the form in which the returns were published since the constitution of the Board of Agriculture.

36,801. It is not necessary to read them, is it?—I hardly think so, but I hand in the memorandum because the subject of the improvement of these returns has constantly engaged the attention of the Board. The Board have very good reason to be satisfied with the improvement which has taken place, and I should like to refer to the fact that the Board are very sensible of the valuable services rendered in this connection by Major Craigie, who was appointed specially for the purpose of taking charge of this and other work in the department. A third important function of the Statistical Branch is the collection and publication of the corn returns, by reference to which the value of tithe rentcharge is annually determined. The system adopted for the ascertainment of the average price of corn was the subject of special investigation by a Select Committee of the House of Commons, which sat in 1888, under the ex-chairmanship of Mr. Jasper More. The statistical branch also compiles the statistics relating to cattle diseases, and is responsible for the collection and publication of returns under the Markets and Fairs (Weighing of Cattle) Act, 1891, as to which I should like to say that we have not done much more than make a beginning in regard to the issue of statistics relating to the prices of live stock, but the Board are disposed to attach great importance to the matter, and to do anything in their power to improve and extend the information available as to the prices both of live stock and of agricultural products generally.

Collection and publication of corn returns.

Collection and publication of returns under Markets and Fairs (Weighing of Cattle) Act.

36,802. Is the subject one which engaged the attention of the Royal Commission on Market Rights and Tolls?—Yes, that Commission gave a good deal of attention to the subject, and recommended, firstly, that it was desirable to collect statistics of market prices of commodities through the agency of market owners as far as may be possible, and, secondly, that it was desirable to collect statistics of the market prices of meat, and in particular that the prices of cattle at per stone, live weight, should be collected in such markets as might be selected for the purpose. Those recommendations have not, speaking generally, been carried into effect as yet, but we should be very glad if it were possible to make some special move in this direction. The adoption of recommendations might involve some increase of the staff of the Statistical Branch, and it would certainly entail the retention of market correspondents at the more important centres. The aggregate expenditure would probably not be large, but proposals for any increase in the cost of the Department are, naturally, very closely scrutinised at the Treasury, and we have had in recent years to make what we considered to be more pressing demands upon the public purse. We should be very glad, however, to know that the Commission view with favour further work in this direction, and it would somewhat strengthen our hands if the Commission considered that information as to the market prices would be of value generally.

Statistics as to changes in character of cultivation.

36,803. Then with regard to the information in your possession as to the changes which have taken place in the character of agricultural cultivation, I suppose the Irish statistics are not under you?—We have no jurisdiction in Ireland at all. With regard to the character of agricultural cultivation, and as to the acreage of cultivated land, I should like to observe in the first place that any evidence which can be given by the Board on this point must necessarily be based almost entirely upon the annual Agricultural Returns, and must follow the lines upon which those returns are built up. For this reason the Board are unable to state to what extent land has been thrown on the owners' hands, as to say with any precision to what extent land has gone out of cultivation, unless it be clear that the owners or occupiers no longer make returns of it under any of the headings in the form of return, and even then the decrease may be concealed by an increase elsewhere in the same area.

Statistics of farms out of cultivation.

36,804. Have you not, at some time, collected statistics with regard to the number of farms out of cultivation—derelict farms?—A return of the number and acreage of arable farms and plots of arable land available for cultivation but unoccupied was issued in 1881 by the Board of Trade, and a similar return was issued in 1887 by the Privy Council, the result of which was apparently to show a better condition of things in 1887 as compared with 1881. We are not, however, favourably impressed with these returns, and we hesitate to put them before the Commission as representing the actual facts either in one year or the other year.

Mr. T. H. Elliott.
30 Nov. 1894.

36,805. (*Mr. Chaplin.*) What were those returns with reference to the land out of cultivation directed to?—They were directed to cases in which the land was available for cultivation, but unoccupied, but they are returns which we should scarcely be willing to attempt to obtain again in that particular form.

36,806. Were those returns made in 1881 and 1887?—Yes, in 1881 and 1887.

36,807. (*Chairman.*) Can you give us the form of particulars asked for?—I could do so. I shall be glad to supply the Commission with a reference to both of the returns; but I may say that after careful consideration we feel that they are not to be relied upon as accurately representing the condition of things at one time or the other.

36,808. (*Mr. Giffen.*) What was the source of information for those returns?—They were obtained through the Inland Revenue officers.

36,809. (*Chairman.*) The information supplied by owners of property?—Yes.

36,810. (*Viscount Cobham.*) Did you use the word "derelict" land?—No, the word "derelict" certainly was not used.

36,811. (*Chairman.*) Was there any information obtained at any time as to the number of farms in the hands of owners?—Yes, but information is now annually obtained. There have also been the two special returns of 1881 and 1887 to which I have already referred.

36,812. Were they different returns, one showing the amount of land out of cultivation and the other the land in the hands of the owner?—I think the 1887 returns give particulars on both points.

36,813. One would suppose that there might be some doubt and difficulty in filling up the return as to what land is uncultivated, but as to lands in the hands of its owners unlet, one would not see any reason for doubt as to the certainty of the information?—No. Of course land might be in the hands of owners who have no desire at the moment to let. Land may also be brought into the same category owing to its acquisition by an occupier. These are two means by which ownership and occupation can be combined.

36,814. Quite so. But if you saw a very large increase at any time of land in the hands of those owners, that would mean that a large amount of land was unlet; and if that amount again was reduced it would appear that the land was being let?—That would be so, subject to the qualification which I have just mentioned. I speak without the return of 1887 before me, and I did not propose to put it in before the Commission as part of the evidence of the Board; but according to that return the condition of things as regards unoccupied arable land was better in 1887 than in 1881. I think I will ask the Commission to allow me to put in those returns, but the Board could not accept any responsibility for them at the present time.

36,815. You have not thought it desirable to repeat them?—No.

36,816. Is there anything in the returns showing the amount of land occupied and owned by persons who make their livelihood by the land; apart from ownership, the land which is enjoyed by persons who have other means of living?—I have not the two returns before me, and I do not propose on behalf of the Board to call attention to them, or to adopt the responsibility for them; at the same time they are public documents, and are at the disposal of the Commission as they would be of anyone else.

Acreage under crops in 1871-5 and 1891-3.

36,817. Have you caused tables to be prepared showing each of the four divisions into which England is divided; and the acreage under crops at different times?—Yes, in the first place we have prepared a table showing the average acreage for certain specified periods of the total cultivated acreage; the permanent pasture, the arable land, and the bare fallow in England, with its different divisions, Wales, Scotland, and Great Britain, which we thought will give the Commission an idea of the gradual changes which have taken place as regards the character of cultivation of the country.

Mr. T. H. Elliott.
30 Nov. 1894.

(*See* Appendix VII., Table I.) In the division I., which comprises the counties of Bedford, Cambridge, Essex, Hertford, Huntingdon, Lincoln, Norfolk, Suffolk, and the East Riding of Yorkshire, the total acreage under all kinds of crops, bare fallow, and grass, has risen from 6,047,000 acres during the years 1871–5, to 6,177,000 acres during the years 1891–3, and there is a rise in the total acreage in the case of each of the four divisions into which we divide England, and also in Wales and Scotland. The table also shows a gradual increase in the amount of permanent pasture, and a gradual diminution of the arable land not including bare fallow. In a separate column we have stated the acreage under bare fallow, or uncropped arable land, which fluctuates very much from year to year.

36,818. You have given us the summary of one return in one division. You have only stated the increase in the acreage under cultivation of some kinds?—Shall I give the figures as to permanent pasture in the same division of England?

36,819. Yes?—The average under permanent pasture in that division was 1,416,000 acres in the years 1871–5. That has increased to 1,817,000 acres in the period 1891–3. Then as to the arable land, the average of the quinquennial period, 1871–5, was 4,470,000 acres, and fell to 4,163,000 acres in 1891–3; and the bare fallow or uncropped land was 161,000 acres in 1871–5, and 197,000 acres in 1891–3.

Bare fallow and uncultivated arable land.

36,820. (*Viscount Cobham.*) Can you distinguish between fallow properly so called and arable land that has been simply left alone?—We are very much dependent upon the interpretation placed upon the return by the different occupiers. We collect the returns from the occupiers and examine them and correct obvious errors and misdescriptions, but our work proceeds upon the basis of the returns themselves. The entry in the return is: "Bare fallow or uncropped "ploughed land from which a crop will not be taken "this year."

36,821. There has been no real increase in fallow properly so called—rather a decrease; but an increase of land that is simply left idle?—I am very anxious indeed to keep quite closely to the line of the returns, because those returns alone constitute our information. We could not say that in every case the same interpretation was placed upon those words by the 500,000 occupiers by whom the returns are rendered, although of course we do everything we can to make the returns clear to them.

36,822. (*Mr. Lambert.*) Could not you put in a return to include a column for land that had gone out of cultivation, or what might be described as derelict land?—You would have, I think, to define very accurately what those two expressions meant, so that all occupiers would place the same meaning upon them. Everything depends upon making the heading in the return clear and intelligible to the occupier, and upon the use of such words as are not capable of misconstruction.

36,823. (*Mr. Giffen.*) Do you think that you would necessarily go to the occupier for the return of derelict land?—Well, for any special return of course special machinery might be devised. But I am speaking now of the annual agricultural returns and of the necessity of making the headings in those returns quite clear to every occupier who receives them. We are constantly making small changes, but there is a certain disadvantage in making changes in the returns because people get confused by them.

36,824. (*Chairman.*) Lord Cobham asked whether you had received the return with regard to bare fallow as an accurate one in the ordinary sense of the term. It is a well-known term, and it seems somewhat surprising that there should be an increase from 161,000 acres to 197,000 acres of bare fallow; it would indicate that the return was made by persons not understanding the meaning of the returns. If the amount of arable land has decreased largely, one would expect the bare fallow would decrease?—I may say that the reason why we thought it desirable in this return to give a separate column for bare fallow was that we thought persons in possession of such land as has been referred to in the proceedings of this Commission might possibly, in some instances, have included it under this particular head. I may say with reference to the fluctuation in land of this character in the north and eastern division that the 161,000 acres returned under this head in the quinquennial period of 1871–5 had increased to 192,000 in the next quinquennial period, and it again increased to 244,000 in the period of 1881–5. Then we had a substantial fall to 183,000 acres in the five years from 1886–90; and a slight increase again to 197,000 between 1891–3, so that the bare fallow, in the division of which I am speaking, is not at the present moment at the high point that it reached in 1881–5.

Mr. T. H. Elliott.
30 Nov. 1894.

36,825. (*Mr. Little.*) May I ask this question: does not it fluctuate considerably with the seasons?—Yes, that is so.

36,826. Wet seasons increase the quantity of fallow, and the fine seasons diminish it?—Undoubtedly. I have given the acreage on an average of five years, but it is very difficult to draw any very distinct conclusion from the figures.

36,827. You have to make up the balance of what is not put down for other crops, and that has to be put into this column in order to make the total quantity right?—No, we put nothing into the column. The occupier may do so in order to make the quantity right, I should say that is quite possible, but it is not corrected by me.

Permanent pasture and land "tumbled down to grass."

36,828. (*Mr. Long.*) Might we know with regard to one other of those sub-divisions, that of permanent pasture in connexion with this so-called derelict land, whether under the heading of permanent pasture, you include the land what the farmers call "Falling down of its own accord"?—My own impression is that some of that land might be included by the owners and occupiers under the head of "bare fallow," but there has been since 1891 a heading for "Mountain and heath land unenclosed," which is available for a limited amount of grazing, and it is conceivable that some of the land of which the Commissioner speaks may have gone under that head.

36,829. (*Chairman.*) There is no heading to say what has tumbled down into grass, therefore it must have been either given under the term of bare fallow or permanent pasture, or land which is occasionally cultivated?—Yes.

36,830. The land must be found somewhere; there are no special headings under which it would appear?—No; the headings are fairly full, but, of course, there is a great danger in returns of this kind of overloading them with instructions. One has to compromise between too much and too little instruction. To overload a return which is already a complicated return and put it into the hands of occupiers may be the means of your not getting any return at all, or getting it very badly done.

36,831. Of course, it is very undesirable to increase the requirements on the occupiers?—Very undesirable, because it, to a certain extent, spoils the other matter that they are in the habit of giving us.

36,832. In fact, you have no means of ascertaining what is the extent of land which has tumbled down into grass?—No, that is not one of the headings in our return.

36,833. It cannot be ascertained by anything given in the agricultural returns, can it?—No, any information that the Board can give on that subject must follow the lines on which the returns are built up.

36,834. (*Mr. Channing.*) Can you suggest any source from which that information can be accurately got?—Possibly some suggestions of that kind might be made if some definition of the expression were available.

36,835. But there are no figures obtainable anywhere?—There are no figures obtainable other than those I have given to the Commission. Of course there is no insuperable difficulty in obtaining a return from the occupier if you can make it quite clear what it is that you want.

36,836. (*Mr. Lambert.*) Of course this return bare fallow would hardly include the land tumbled down to grass, because it is distinctly stated to be "uncropped, ploughed land," and if laid down to grass it would not be that?—That is so, but nevertheless it has been thought that some occupiers may possibly have returned it under that head.

36,837. (*Mr. Giffen.*) Do you not find, from the individual returns, what does happen?—I do not reach any case in which information has been elicited bearing upon that particular point.

Acreage under crops in England in 1871-5 and 1891-3.

36,838. (*Chairman.*) Will you go on with the summaries?—Taking Division II., which comprises Berks,

Mr. T. H. Elliott.

30 Nov. 1894.

Buckinghamshire, Hants, Kent, Leicester, London, Middlesex, Northampton, Notts, Oxford, Rutland, Surrey, Sussex, and Warwick, we find as regards the total acreage of all kinds of crops very much the same changes as in the case of Division I. The total acreage has risen from 5,692,000 in the quinquennial period of 1871–5 to 5,821,000 in the period of 1891–3. The permanent pasture has risen from 2,313,000 to 3,067,000, taking the same periods. The arable land has fallen from 3,239,000 to 2,623,000; and the bare fallow is practically stationary. It was 140,000 in 1871–5, and 131,000 in the triennial period of 1891–3. But it was very much higher in the period of 1881–5, very probably due to the conditions of weather during that quinquennial period.

36,839. (*Viscount Cobham.*) You are getting the returns much better filled in as time goes on, I suppose?—Undoubtedly. I shall mention later on that that is a qualification always to be borne in mind.

36,840. (*Chairman.*) Will you take the next division?—In Division III., which comprises six western and four south-western counties, the total acreage under all kinds of crops has risen from 5,985,000 to 6,404,000; the permanent pasture has risen from 2,815,000 to 3,769,000; and the arable land has diminished from 3,035,000 to 2,574,000; the bare fallow has fallen from 135,000 to 61,000. In Division IV., which contains four northern and six north-western counties, the total acreage under cultivation has risen from 6,189,000 to 6,576,000; the permanent pasture has risen from 3,673,000 to 4,430,000; the arable land has fallen from 2,384,000 to 2,086,000; the bare fallow from 132,000 to 60,000. That is again comparing the period of five years of 1871–5 with the period of three years 1891–3. The return gives totals for the four divisions of England, and also for Wales, Scotland, and Great Britain.

36,841. (*Mr. Lambert.*) In what manner do you divide the country? Is it by one course of cropping or a difference in soil or what?—In the first instance it is done geographically; but dividing the counties geographically you do get a certain similarity as regards soil and crop, for instance, you have Bedford, Cambridge, Essex, Hertford, Huntingdon, Lincoln, Norfolk, Suffolk, and the East Riding of Yorkshire. That is a geographical classification adopted with regard to agricultural conditions as much as possible.

Acreage under crops in Wales and Scotland in 1871–5 and 1891–3.

36,842. (*Chairman.*) In Scotland it would appear that the reduction of arable land has been very small; in fact, compared with 1871–5, there has been an increase. Will you state the figures for Wales and Scotland?—For Wales the total under cultivation has risen from 2,652,000 acres to 2,868,000 acres; the permanent pasture has risen from 1,581,000 to 1,998,000 acres; the arable land has diminished from 1,038,000 acres to 861,000; and the bare fallow has fallen from 33,000 to 9,000. In Scotland the total acreage has risen from 4,561,000 in the period 1871–5 to 4,903,000 in the period 1891–3; the permanent pasture has risen from 1,085,000 to 1,347,000; the arable land has slightly increased from 3,454,000 to 3,548,000, and the bare fallow has fallen from 22,000 to 8,000 acres.

36,843. Does this total increase of nearly 1,600,000 acres in the quantity of land under crops of all kinds indicate any real addition to the cultivated land of the country or no?—To some extent it does, and to some extent it does not. In the earlier years the increases of permanent pasture are due in part to more closely collected and better defined returns; on the other hand, as regards permanent pasture there has been a transfer of some of the rougher upper land to the more accurate classification of uncultivated grazings. When we commenced in 1891 to get returns of what we call uncultivated grazings, rough mountain, and heath land, some of the land that had been returned as pasture no doubt went into the new classification, and to that extent reduced the amount of permanent pasture. Then reclamations and enclosures have taken place, whilst on the other hand, urban lands have extended, which would diminish the area under cultivation.

Changes in the areas of permanent pasture and arable land in Great Britain.

36,844. Taking the aggregate it would appear that the permanent pastures increased for Great Britain by 3,600,000 acres, and that the arable land has decreased by 1,800,000 acres. Therefore there has been double the increase of permanent pasture as compared with the decrease of arable land?—Yes, that is so. The greater part of that increase was shown in the first 10 years and undoubtedly is due to a very substantial extent to the improvement in the returns.

36,845. (*Mr. Giffen.*) You say, "In the first 10 years"—what precise time have you in your mind?—I am now taking the years 1873, 1883, and 1893.

Mr. T. H. Elliott.

30 Nov. 1894.

36,846. Do you think a great difference was made in the table from 1873 to 1883 by the continuous improvement in the returns?—Yes, there was more room for improvement in the earlier stages of the returns, I should say.

36,847. (*Chairman.*) I do not think the figures show that there has been a greater increase in the first 10 years than in the last 10 years, for I find that from 1881 to 1891 the increase of permanent pasture has been from 15,000,000 to 16,400,000, which is 1,400,000. There is a somewhat greater increase in the first 10 years, but still there has been a great increase in the last 10 years, and the reduction of arable land has been from 16,600,000 to 15,800,000, which is about 800,000 acres?—I shall be able in later tables to give the Commission further information as to the three years 1873, 1883, and 1893.

36,848. (*Mr. Giffen.*) You were not personally connected with the collection of the returns at the time they commenced?—No, I was not personally acquainted with it at the time; but I think there is no doubt that when you are first commencing to obtain returns you make improvements much more rapidly than after the returns have been for some time in existence. The ratio of improvement is greater at the commencement than later on. I think it is reasonable that it should be so.

36,849. I am putting the question partly because I have some acquaintance practically from the year 1876 with the collection of the returns, and I should doubt whether you are perhaps not attaching too much importance to an element of that kind, after 1876 at any rate?—Of course that may be so. We, perhaps, have rather under-valued the improvement in later years and over-valued the improvement in the earlier years, but I think there is no doubt that there was substantial improvement in the earlier years in the way in which these returns were collected.

36,850. (*Chairman.*) Even taking the last 10 years there seems to have been a very large increase of permanent pasture, a much larger increase of permanent pasture than there has been decrease of arable land?—Yes, that is so.

36,851. There has also during the same time been a great reduction in the amount of bare fallow?—The bare fallow after all is not a very important item, so far as the total acreage under cultivation is concerned.

36,852. In 1881 it was 734,000, and in 1891 it was 466,000, a reduction of nearly 300,000?—Yes, but the total acreage is 33,000,000, and therfeore it is only 1 per cent. after all.

Effect of an improvement in the returns on the statistics of acreage.

36,853. (*Lord Rendel.*) I suppose that an improvement of 5 per cent. in the returns would about account for the increase in the total of the cultivated land?—It is of course very difficult to measure improvements in returns by per-centages. I should hesitate to assent to that without more thought.

Total cultivated area in Great Britain in 1873, 1883, and 1893.

36,854. (*Chairman.*) Is it the third table that you have been speaking of?—No, the first table. We have also prepared for the information of the Commission a set of tables really showing the details for each county in England, Wales, and Scotland, but taking the three years 1873, 1883, and 1893, instead of quinquennial periods. The first return shows the total acreage under all kinds of crops, bare fallow and grass, for the years 1873, 1883, and 1893, with a comparison of 1893 with 1873, and of 1893 with 1883. (*See* Appendix VII., Table 2.) If you take the total cultivated area in 1893 as compared with 1873, you will find increases in every county in Great Britain with the exception of Banffshire, Elgin, and Haddington, where in each case there is a very slight decrease in the total cultivated area. If you take 1893 as compared with 1883, you will see there are decreases shown in 39 counties in Great Britain, but that many of them are small, and are much more than counterbalanced by the increases in other counties. So that if you compare 1893 with 1883, taking the cultivated area of Great Britain as a whole, you will find an increase of 258,000; but if you take 1893 as compared with 1873, you have an increase in the total cultivated area of something over a million and a half acres. The table that I put in will show for each county what the particular increase or decrease has been.

36,855. (*Lord Rendel.*) Those figures would show an increase of 4½ per cent.?—Yes, very nearly that.

Mr. T. H. Elliott.
30 Nov. 1894.

36,856. Therefore an improvement of only 4½ per cent. in the returns would account for the increase?—Yes; but I should hesitate to put improvement in percentages. I should say that an improvement of 5 per cent. in the returns, if you could show such an improvement, would, in fact, be a very considerable improvement.

Effect of an improvement in the returns on the statistics of acreage.

36,857. (*Chairman.*) I did not understand you to say you consider that during the last 10 years the increase has been due to that?—No, not to that extent.

36,858. A portion of the increase during the first 10 years was due to greater correctness in the returns?—Yes.

36,859. (*Mr. Giffen.*) Is it likely that the cultivated land is understated by the occupiers in the aggregate at any one time to the extent of 5 per cent. after the first year or two from the time it commenced?—I should scarcely have thought so. I think there is no doubt that a considerable portion of this increase of acreage is an actual increase in acreage. I do not think the improvement in returns should be pushed too far, but I am obliged to state it as a factor to be considered.

Cases of failure to render returns.

36,860. (*Mr. Everett.*) There was a great hostility against making the returns when they were first issued; farmers had an idea that they were connected with some method of adding to their taxation?—That is so; but I think they have learnt now that there is no question of taxation. We find the per-centage of failures to render returns is gradually diminishing—it is now a very small per-centage.

36,861. How do you deal with those returns which are not made?—The officers make estimates according to the best information they can obtain in the locality; but the per-centage of estimates is now really very small, and every year we report a decreasing per-centage, which says something at any rate for the growing appreciation of these returns by the farmers. The second table that I would put in gives similar information as to permanent pasture. (*See* Appendix VII., Table 3.) If you compare 1893 with 1873 you will find an increase in permanent pasture in every county with the one single exception of Wigtown. If you take 1893 as compared with 1883 you will find an increase of permanent pasture in every county except Cheshire, where there is a nominal decrease of 342 acres; and Banffshire where there is a nominal decrease of 175 acres; and then there are also decreases in Bute, Lanark, Orkney, Shetland, and Stirling.

Acreage of permanent pasture in each county in 1873, 1883, and 1893.

36,862. (*Mr. Giffen.*) All permanent pasture?—All permanent pasture. Then taking the figures for arable land (not including bare fallow) you will find that taking 1893 as compared with 1873 there are decreases in every English and Welsh county except in Cornwall, Lancashire, and in 18 of the Scotch counties. (*See* Appendix VII., Table 4.) If you compare 1893 with 1883 you will find there are decreases everywhere except in Cornwall, Cumberland, Lancashire, Anglesea, Pembroke, Radnor, and nine Scotch counties. The next table gives the same information for counties with regard to bare fallow. (*See* Appendix VII., Table 5.) If you compare 1893 with 1873 there are decreases in bare fallow in 28 English counties and in all the Scotch and Welsh counties, but that there are increases in 14 English counties. In 1893 as compared with 1883 there are decreases in bare fallow in all but five English, one Welsh, and two Scotch counties. But I do not wish to attach undue emphasis to any of the information as to bare fallow, which is doubtless very much affected by the actual climatic conditions of the particular year. Still the information has a certain value, and we put it in because of the possibility of some of the land which is specially engaging the attention of the Commissioners having, owing to the misapprehension of the occupiers, been included under that head (*handing in Tables No.* 1 *to* 5).

Acreage of bare fallow in each county in 1873, 1883, and 1893.

Qualifications to be considered in respect of statistics of acreage.

36,863. (*Chairman.*) Then I think we come to your sixth table?—My sixth and seventh tables bring together in a convenient form for each county in England, Wales, and Scotland the additions or diminutions under each of the four heads that I have mentioned. (*See* Appendix VII., Tables 6 and 7.) I should like to say with regard to all these tables that they must be taken with important qualifications. I have mentioned to the Commission the fact that we consider that the increases in the cultivated area and in permanent pastures are largely due, especially in the earlier years, to more closely collected and better defined returns; but on the other hand, as I have said, there has been a transfer of some of the rougher upland pastures to the mountain and heath grazings of which we have taken special account during the last two years; and the extension of urban lands is also a factor to be taken into account.

Mr. T. H. Elliott.
30 Nov. 1894.

36,864. What do you mean by the extension of urban lands? Do you mean mountain land taken from cultivation and given up to building?—Not necessarily mountain land, but land in respect of which agricultural returns have previously been rendered.

36,865. That would indicate a reduction?—Yes. You may take it that there is a small but appreciable diminution of the agricultural land due to the extension of building. Then I should like also to observe that the adoption of so large an area as the county makes it important to bear in mind the fact that the increases or decreases are the net result of the changes which have taken place, and that, for example, the area reclaimed or enclosed in one part of a large county may be counterbalanced by the departure of land out of cultivation in another part of the county. There might very well be shown an increase in the cultivated area of a county, whilst at the same time land was going out of cultivation from the operation of a particular set of circumstances in one part of the county.

36,866. (*Viscount Cobham.*) Why cannot you show the increases and decreases instead of only showing the net results?—It is a question of labour, and to a certain extent a question of the secrecy of returns. There would be an objection to the publication of these returns for parishes because owners and occupiers might then say that we were making individual returns too evident.

36,867. You might show the whole increase in a county and the whole decrease in a county, but yet you only give the net?—If that information were considered useful, and the necessary staff were provided, I do not think there would be any great objection to give it.

Possibility of publishing returns for smaller areas than counties.

36,868. (*Mr. Little.*) Has the Department ever considered the possibility of publishing occasional returns for a smaller area than a county—say for a poor law union?—Yes, we have in reply to special applications supplied information of that kind, taking poor law unions as the area.

36,869. To the Sub-Commissioners of the Labour Commission, I believe?—Yes, that was so. We have always been very ready to give that information, but of course clerical labour is a point to be considered; and to give such information year after year for smaller areas than the county would very much increase the size of returns.

36,870. But if this were done once in five years it would record changes which are taking place which are not shown by the returns for whole counties?—Personally I should think it would be very useful if something in that direction could be done, but it is very much a question of clerical staff. It is from no disinclination on our part that we do not amplify the returns even beyond what they are. I think it may be useful if I put in some further observations as to the changes within the cultivated area which were made by the director of our statistical branch, Major Craigie, in his annual report for 1893. We shall be very glad to supply copies for the use of the Commissioners.

Amount of uncultivated land.

36,871. (*Mr. Dalton.*) Have you any information from year to year as to the amount of the uncultivated area?—We have information as to the total area of the country as computed by the Ordnance Survey. We have information during the last two years as to the mountain and heath land, used for rough grazing, and we have also information as to the cultivated area, but by deducting the cultivated area from the total area of the country you would not get the area uncultivated.

36,872. (*Mr. Little.*) Because the total area includes hedges and ditches?—It includes a good deal of land that could not be cultivated by any possibility obviously, as well as inland waters.

36,873. (*Mr. Giffen.*) It also includes river courses and canals?—Yes, it includes the whole surface of the country.

Changes in area of forest-land, woods and plantations.

36,874. (*Mr. Dalton.*) Have you got any information as to the extent to which forest land increases or decreases?—We did get two or three years ago a special return of woodlands and plantations, and that information has been annually reproduced. We shall probably obtain that information quinquennially.

36,875. (*Chairman.*) Apparently from the Agricultural Returns of last year the amount of land in woods and

Mr. T. H. Elliott. 30 Nov. 1894.

plantations has increased from 2,187,000 acres in 1873 to 2,458,000 in 1883, and 2,694,000 in 1893, showing a very large increase of upwards of half a million acres. Do you imagine that that return is to be relied upon as showing the real increase of land under woods and plantations?—My impression is that the figures are not strictly comparable.

36,876. I have taken this from the annual report, page 50?—If you have got the return for 1891 will you look at page 34. You have there the total area of land and water, you have the mountain and heath land used for grazing, the nursery grounds, and then the woods and plantations.

36,877. The aggregate is pretty much the same, as you will see on page 35. It is 2,694,000, which is the same figure as I have quoted from page 50. Therefore the probability is that the same form of return was given for 1873 and for 1883?—For 1873 you will see there is a note that the return was made in 1872, and then there is a note against the figure 1883 to the effect that the return was made in 1880.

36,878. That only shows that it was taken two or three years sooner in each case, the important fact remains that it is to be relied upon that the amount of land under wood and plantation has increased by half a million in the 20 years?—Yes, that is comparing the return for 1872 with the return for 1891.

36,879. That is an interval of 19 years?—Yes.

36,880. The question is whether these returns are to be relied upon, and whether there has been that increase of land under wood and plantations?—With regard to a comparison of the returns, 1872 and 1891, alteration of method, and the improvement in the collection of the returns, would be very important factors. I do not think the difference between the return of 1872 and the return of 1891 could be relied on as showing the extent to which the woodlands and plantations had increased throughout the country.

36,881. (*Viscount Cobham.*) Coppice woods were not rated in 1872, were they?—No, the change was made in 1874.

36,882. (*Chairman.*) Look at the difference between 1883 and 1893, that shows an increase of about 250,000?—I am not in any way taking exception to the figures as quoted.

36,883. What I want to know is whether on the whole you think that the return is to be relied upon or not?—I think that the return is to be relied upon up to a point, but that when using the figures for comparative purposes you must make great allowance for alteration and improvement in method.

36,884. At any rate the returns would indicate that there has been a large increase of plantation?—Yes, they would indicate that.

36,885. (*Viscount Cobham.*) Mainly in Scotland?—Yes.

Explanations of increase in total cultivated area.

36,886. (*Mr. Dalton.*) But you have an increase, have you not, of about a million and a half acres of permanent pasture which is not accounted for by the permanent pasture which has been taken from the arable land; then you get another half a million acres of woodlands, so that you have two millions acres more under cultivation, and the question is where does that land come from?—The question rather assumes that two million acres have come from somewhere; I do not think that it is to be assumed, because we have all along thought that the improvement in the returns must bulk for something.

36,887. That is the reason I asked the question?—Undoubtedly there has been an increase in the land under cultivation due to actual reclamation and to fresh enclosures.

36,888. It would not come to anything approaching two million acres, I suppose?—No, it would come to nothing like two millions.

36,889. (*Mr. Chaplin.*) May it not be this, that a great deal of land which has what is called "tumbled down" to grass might be considered to be out of cultivation, but is included in what is called pasture?—I should think it is quite possible. It depends upon the view that the occupier or the owner making the return may take of his own property—whether he regarded it as out of cultivation. If he regarded it as out of cultivation he would not return it, but I do not think he does regard it as actually out of cultivation.

36,890. (*Chairman.*) During the same time there appears to have been a large increase in the amount of land cultivated in market gardens, in orchards, and in nursery grounds?—Yes; but there again you have to take into account the factor of improvement.

Mr. T. H. Elliott. 30 Nov. 1894.

36,891. The increase has been so very great that one can hardly suppose that that can be largely due to improved returns?—No.

36,892. Besides market gardens is a very definite thing?—It is.

36,893. It does not raise the difficulty of putting it down under one head or another?—No.

36,894. One would hardly imagine that a person cultivating a market garden would put it down under some other head?—No.

36,895. (*Mr. Everett.*) The expression "cultivated area" is very misleading to the ordinary agricultural mind. We are accustomed to regard as cultivated land only land which is tilled. We do not cultivate meadows, for instance. If the Department could change that term into meadow and arable land when you want to include the whole it would be much plainer to common folk?—We have rather drifted into the habit of using it simply as a short expression. The expression in the returns themselves is "Total acreage under all kinds of crops, bare fallow and grass." If one always used that expression one would of course avoid ambiguity, but it is a rather cumbrous way of speaking.

Increase in number of horses used solely for agriculture.

36,896. (*Chairman.*) Would you turn again to page 50 of the Agricultural Returns. You will see the number of horses given there for the three periods of 1873, 1883, and 1893. It is a somewhat strange fact that, in spite of the reduction in arable land, the number of horses used solely for agriculture has increased from 941,000 in 1873 to 995,000 in 1883, and 1,012,000 in 1893, showing a continuous increase in the number of horses used for agriculture as distinguished from unbroken horses and the mares kept solely for breeding, which have also largely increased. Do you know whether there is any explanation of that?—No.

36,897. One would have supposed that with the reduction of the amount of land in arable cultivation the number of horses would have decreased, but in spite of that it appears to have increased considerably?—Yes, taking those three years that is so.

36,898. (*Mr. Little.*) Would not an increase in the breeding of horses increase the number? Where a large breeding stud is kept and the horses are worked for nine months in the year, they would be returned as "horses "used solely for the purposes of agriculture;" they could not be returned as "mares kept solely for the pur- "poses of breeding"?—Yes; I may say that the item in the return includes, first of all, horses used solely for agriculture and by market gardeners; then you have the unbroken horses, including foals; then you have mares kept solely for the purposes of breeding, including, under that third head, mares merely worked so as to keep them in condition.

36,899. A farmer setting about to increase the breeding of horses would keep two or three more, because he loses the services of some of them for three months, and those horses would be returned as "horses used in agriculture"?—There are three heads in the return as the Chairman has pointed out. There are "horses "used solely for agriculture" which have increased from 941,000 in 1873 to 995,000 in 1883, and 1,012,000 in 1893.

36,900. (*Mr. Everett.*) Will you give the figures under the other two heads?—Those heads comprise unbroken horses and the mares kept solely for breeding, including mares merely worked in order to keep them in condition. We did not separate the two classes in 1873 and we only had one figure for the two classes. In 1873 the numbers were 334,861. In 1883 the total was 415,000, and in 1893 511,000, so there has been a steady increase in horses generally.

36,901. Classify them how you like?—Classify them how you like.

36,902. (*Mr. Giffen.*) Have they taken the place of the labourer to any extent, having regard to the increase in machinery?—That I could hardly say. That is a point to which my attention has never been directed.

Decrease of arable land and increase of permanent pasture.

36,903. (*Chairman.*) Taking the whole of Great Britain, the arable land, I understand, showed a diminution in the first 10 years of 867,000 acres?—Yes.

36,904. And in the second period of 1,169,000 acres?—Yes.

Mr. T. H. Elliott.
30 Nov. 1894.

36,905. While during the same time the permanent pasture showed an increase of 2,149,000 acres in the first decennium, and of 1,428,000 acres in the second?—That is so.

36,906. Do you propose to say anything in any future part of your evidence about the increase in cattle?—No, that was not one of the points to which the Commission directed our attention specially, and I have not included anything under that heading in my brief.

Increase in number of cattle and sheep.

36,907. Apparently there has been a large increase in the number of cattle in the same period?—Yes.

36,908. Taking the aggregate of the cows and cattle of all sorts, there has been an increase from 5,964,000 head in 1873 to 6,700,000 head in 1893?—Yes, those are the figures given in the returns.

36,909. And sheep have rather decreased—from 29,400,000 to 27,280,000?—Perhaps it would be more convenient, as questions have been asked me upon these points, that I should put in further tables with regard to horses, cattle, and sheep. I should like to look into the matter more freely, and to submit tables to the Commission formally. (Appendix VII., Tables 8 and 9.)

Increase in area of hops.

36,910. In the case of hops I see there has been a reduction, especially as compared with 1883. Hops increased in acreage from 63,000 in 1873 to 68,000 in 1883, and then fell to 57,500 in 1893, showing a considerable reduction since 1883?—Yes, there has been a further increase in 1894; but as regards hops I would make the same observation, that if the Commission would wish to receive tables I should be glad to have them prepared and to submit them. (Appendix VII., Table 10.)

36,911. (*Viscount Cobham.*) Are the figures relating to the number of stock made up for 1893 inclusive?—Yes, for 1893 inclusive.

Effect of drought of 1893.

36,912. So it takes into account the reduction that arose last year in consequence of the drought?—Yes, to some extent.

36,913. (*Mr. Everett.*) The effect of the drought of 1893 would not show itself until you come to the returns of 1894, because we had not felt the severity of the drought in June 1893 when the returns were made for that year?—That is so.

36,914. (*Viscount Cobham.*) The returns were made up in June 1893?—In June 1893, and in June 1894.

36,915. (*Mr. Lambert.*) When will they be published? Abstracts of the results have been published, and the complete figures are practically available.

Collection of prices of live stock.

36,916. (*Mr. Giffen.*) With regard to the prices of live stock, I suppose you have met with great difficulties in obtaining satisfactory returns at all, especially on a large scale and for comparative purposes?—Yes, that is so; we think, however, that some attempt should be made to get over those difficulties, and that by the appointment of market correspondents acting under skilled supervision we might get more satisfactory returns than are at present available.

36,917. How many correspondents do you think of appointing; how many markets would you send to?—We should simply, I think, take the more important markets, perhaps not more than 15 or 16. We get statistics of live weight prices from about that number at the present time, and that would make a very good beginning.

36,918. But there are fundamental difficulties, I believe, in defining the different descriptions of cattle, as to which you obtain the prices of live weight?—That is so; the variety of the article is so great that it is difficult to divide it up into classes.

36,919. Even when you have got the machinery on the spot?—Even when you have got the machinery; but still I should hope that we should be able to devise a sufficiently good system of classification.

36,920. Suppose you had power to compel a certain number of cattle to be weighed and to obtain returns of the aggregate price, and of the aggregate weight, then you would have some material for a consolidated price such as that you obtain in the corn returns, would you not?—Yes. We are supposed now to get information as to the prices of stock sold by live weight, but the numbers so sold are too small to give anything like a good price for statistical purposes.

36,921. And then there is an attempt to distinguish a great many different qualities of different kinds of stock which makes the return not so useful afterwards for comparison, because you have such a multiplicity of figures?—I should hardly say that. I think we have attempted in our live stock weights to take three qualities. I do not think that that was too ambitious; but there are great difficulties in dividing live stock even into three classes.

Mr. T. H. Elliott.
30 Nov. 1894.

36,922. When you distinguish between different breeds of cattle as well as between three qualities that makes a considerable number of different articles?—Yes, that is so. Of course any information must be in the nature of a compromise between too much detail and too little detail.

36,923. You have come to no conclusion as to what particular plan you will carry out in future; it is a little indefinite at present, as I understand?—We have come to no conclusion as yet, because we really are not in possession as yet of anything like sufficiently complete returns from the markets.

Extent of encroachment of urban areas on agricultural land.

36,924. Can you give us any idea of the extent to which the building of houses encroaches upon agricultural land? Can you give us a quantitative expression of the thing?—I think not. Probably information of that kind could be better obtained from the Local Government Board, who might be able to state what was the acreage of land under urban government, although that would not necessarily exclude agricultural land.

36,925. You do not think it affects any inferences from the returns over the whole county, do you?—We should not be able from our returns to state to what extent there has been a reduction in the cultivated area owing to the increase in the urban land.

36,926. It might affect small local areas and yet be of no importance as regards the returns for the country generally?—That is so.

36,927. (*Mr. Everett.*) Could not you put a separate heading in your return asking for a return of land given over to building in the year?—We ask the occupier to state what is the condition of things on a certain date—last year it was on the 4th June. I am afraid that if we were to ask the occupier to state what had been the condition previously we should not get the information with anything like accuracy.

36,928. I meant currently and henceforward, not in reference to the past?—The very fact that the land had been given over to building would mean that the cultivating occupier no longer occupied. I do not think it would be possible to get the information in that way. If anything were to be done in that direction you would have to adopt some other means.

36,929. (*Mr. Giffen.*) You have told us you have no responsibility for the agricultural returns of Ireland?—No, none whatever.

Statistical methods of obtaining agricultural returns in Great Britain and in Ireland.

36,930. Have you made any comparison between the statistical methods of obtaining returns of acreage and other matters in Ireland, and the statistical methods you employ?—Only very generally. In Ireland they have the advantage, for purposes of this kind at any rate, of a highly organised constabulary force, and they use that force for the collection of statistics, a matter in which their services are of the greatest value, I believe. But I am not prepared to say that their returns are better than ours, or that our returns are better than theirs.

36,931. Have you compared their definitions of permanent pasture and mountain land, and waste land, with yours; and points of that kind?—There is frequently communication between the two departments on these points; but whether we have got to absolute uniformity I should hardly like to say.

36,932. (*Mr. Little.*) On that point of Ireland, might I ask whether the Irish Government have not had, for various purposes, to make a much more minute survey of Ireland than has ever been made of England, for the purpose of classifying the different descriptions of land?—Yes, that is so.

36,933. For the purposes of the Land Acts, and for the use of the Land Commission, they have divided the total area into classes, including woods and plantations, turf bog, marsh, barren mountain land, and water, roads, fences, &c., and shown the area in each class?—Yes.

36,934. (*Mr. Giffen.*) I believe there was a case some time ago—I think it would be before your time—in which differences appeared in the returns for Ireland as compared with ours, on this very point of the distinction between permanent pasture and mountain land; but you are not acquainted with that, I suppose?

Mr. T. H. Elliott.

30 Nov. 1894.

—No, I was not aware that there was any such point; but I may say, generally speaking, that we should be anxious, as far as possible, to make the figures comparable.

Value of annual and quinquennial returns.

36,935. I should like to ask if you consider that an annual return of acreage containing all the particulars in that annual return that you have is really necessary, and whether a smaller annual return, and a more detailed quinquennial return, would not be quite sufficient for your purpose?—I should hardly think so, because of the fluctuations and variations in particular years. The return I have put in showing the average of the years in a quinquennium, is probably a much better return upon which to base any conclusions than a return taken for a single year would be.

36,936. Have you followed the methods of any foreign countries; do any of them give an annual return of acreage such as we have?—I think, generally, we are much ahead of foreign countries as regards our returns.

36,937. (*Mr. Chaplin.*) As to land do you mean?—As to our agricultural returns. But I should very much hesitate before assenting to the abandonment of the annual collection of the information.

36,938. (*Mr. Giffen.*) Do you think there is a sufficient *quid pro quo* for the expense incurred in obtaining it?—I think so. The expense is not by any means very great, and my view is that the returns annually bring under the review of agriculturists the condition of things, and that it would be unfortunate if the annual distribution of these returns was abandoned. I think it would be a retrograde step.

36,939. It would be quite easy, as you know, to multiply statistics on any subject, and obtain annual returns of a great many things that we do not do now, but the question arises, what is the distinct advantage; suppose it was proposed to have an annual census instead of a decennial one, for instance?—I should say if I were pressed on that point that I regard these returns as not only supplying information but as in some degree educational. Whenever they appear they are the cause of articles in agricultural newspapers; everyone is talking about them, and they help to make agriculturists think. If they only appeared every five years a very useful stimulus to thought on the part of agriculturists would be taken away.

36,940. But surely the same benefits would arise if you had an annual census of human beings as well as an annual census of pastures, and human beings are more important than pastures after all?—I take more interest in agriculturists than in human beings generally, and I am looking at this question of the annual returns simply from the point of view of the agriculturist. I am satisfied that there would be great disappointment if these annual returns were discontinued or made quinquennial, and I believe, as I say, that a very useful factor in increasing the intellectual life of agriculturists would be taken away. It is quite evident when we issue the abstract in August, when we issue the county summaries in September or October, and when we issue the full returns, that they are the subject of considerable thought and attention on the part of the agricultural newspapers, and on the part of agriculturists generally; and I believe that anything which makes farmers think scientifically and intelligently is of substantial value to them.

36,941. But they might think scientifically and intelligently without having information brought before them annually, which is not really necessary, and which does not advance the business in any distinct method?—I should say as to that, that from all that I can gather these returns are now appreciated and have been for some years past increasingly appreciated by agriculturists. Certainly I should be opposed to the issue of statistics simply for the statistical fun of the thing, if I may be allowed to use the expression; but I do believe from what I see and hear that these annual returns are appreciated in a very great measure by agriculturists, and therefore I should be very sorry if they were abandoned or shortened.

36,942. Still that is not a precise answer to my question; what is the advantage which is got by having them annual which would not be got by having them at more distant intervals?—Agriculturists use these returns in part in order to guide their operations. We have been rather pressed to expedite the issue of these returns in order that they may better serve this purpose.

36,943. In what way?—As regards his future course of action. It is quite clear that if the area under a particular crop, or the number of a particular description of stock diminishes, producers consider whether there is not an opening for increasing it, and *vice versâ*.

Mr. T. H. Elliott.

30 Nov. 1894.

36,944. But you cannot give us a concrete illustration of how any particular farmer uses it to make any sum of money out of these returns?—I should prefer that a farmer himself should give that concrete illustration. We receive repeated testimonies from practical agriculturists to the value of these returns.

36,945. I merely wish to have on record what the nature of the use of the annual return is as compared with the quinquennial return on many points?—I am not a farmer myself, and I have never used these returns. I am more responsible for the issue of them. But certainly nothing that I have ever heard has induced me to think that these returns do not serve a practical purpose in the hands of the farmers—at any rate, their representatives speak and act as if they did serve a valuable purpose.

36,946. (*Viscount Cobham.*) Do you think an annual return more trustworthy than a quinquennial return would be?—Certainly, because by the possession of an annual return you can get your quinquennial average which is much better than a return taken at intervals of five years.

36,947. (*Mr. Giffen.*) But is there not a great danger each year of copying last year's return to some extent?—I do not think so.

36,948. Is there not a danger in all annual returns of that kind that the clerks and people who make them are very apt to take the previous year's return as the basis and not to take too much trouble over them?—In this case the returns are not made by clerks and people of that kind. I cannot imagine that a farmer would keep the return for 1893 in order to copy it in 1894; that is not how the farmer goes to work at all.

36,949. (*Mr. Clay.*) You have been questioned about these returns, whether the farmers appreciate them or not, and I think you said they do?—I have every reason to think so from what their representatives and their newspapers tell us.

36,950. I think the drift of Mr. Giffen's questions was that they did not recognise the value of the returns sufficiently?—I ventured to say that as far as I could judge from what I have heard from the representatives of the farmers or the leaders of the farmers, and from the newspapers which the farmers read, that they do appreciate the returns. We are constantly being pressed by representatives of agricultural interests to expedite and improve and enlarge these returns.

36,951. Permit me, as a farmer, to express an opinion that your view is correct; in Scotland, at all events, we appreciate these returns and value them greatly; and we think your office, instead of being a mere machine office, gives forth information which is valuable, both for landlord and for tenant?—You, Sir, have added your individual testimony to the testimony that we are constantly receiving as to the value of these returns, and I, of course, am glad to hear it. May I say that we have no desire at all to issue statistics which serve no real purpose and are of no advantage to agriculturists. I should quite agree that unnecessary statistics ought not to be issued.

36,952. (*Mr. Giffen.*) My questions were solely directed to the point whether a less frequent return would not give all the same advantages at less expense?—Yes, I quite understand that.

Expense incurred in collection and publication of agricultural returns.

36,953. (*Mr. Clay.*) Regarding the expense, may I be allowed to ask you what is the general outlay of Government money in your department upon the collection of these returns?—The returns themselves are collected by the Inland Revenue officers, and the Inland Revenue officers now receive no special remuneration for the work. Consequently so far as the agricultural returns are concerned, I think I may say that the only expense is for the clerical staff engaged upon them at the Board of Agriculture, with of course a certain proportion of the salaries of the supervising staff and the cost of printing and stationery, which is considerable. The returns do not involve any extravagant outlay.

36,954. Could you name something like a general sum that is allowed by Government for that staff?—No sum is allowed. In the statistical branch under the

Mr. T. H. Elliott. 30 Nov. 1894.

general superintendence of the director of the division, which comprises also the intelligence and educational branches, we employ two superior clerks, 11 clerks of the second division, three assistant clerks, and five boy clerks. Those clerks, of course, not only perform work in connexion with the returns of which I am speaking, but they transact the whole of the business of the branch. The clerks who are engaged on this particular work at one time during the year are engaged on other returns and other statistical work during the remaining portion of the year. I have referred already to some of that work, namely, the produce returns, the returns relating to diseases of animals, the returns of live weight statistics, the corn returns, and so on.

36,955. Your returns to the Treasury in the shape of money will be distinctly stated, will they not?—Yes, but we do not attempt to allocate to a particular branch of the statistical work the cost of that particular branch.

36,956. And you cannot condescend to name the sum that it costs the country for the special department which deals with agricultural statistics?—No, I might give you some rough estimate with a little time for thought, but it would be very difficult. For instance, I give a certain amount of time and thought to questions of statistics, but it would be very difficult for me to say exactly what proportion of my salary should be put down to statistical work. Every permanent officer knows how difficult it is to divide out his salary amongst the different kinds of work that he does.

36,957. Have you no idea what it would cost generally, roughly speaking, I do not want to pin you down to any figure?—I should say that it certainly does not cost 10,000*l*., or anything like it.

36,958. (*Mr. Giffen.*) How much was paid to the Inland Revenue officers at the time they were paid separately for the duty?—I think about 11,300*l*., or 12,000*l*.

36,959. Was it not rather more?—I am speaking from memory, and no payments are made now.

36,960. Of course the duty is considered in assigning the salary of these officers?—The duty is considered in assigning the salary, although that is not a matter within our cognisance in any shape or form.

36,961. Still the country has to pay the expense of it all the same?—I doubt whether the country would have to pay very much less if the work were knocked on the head. You would certainly not get an immediate reduction of the cost, that is to say, you would not at once alter the salaries of the Inland Revenue officers if you abolished these returns; at least, I should be very much surprised.

36,962. Still these returns were considered in assigning the salaries of the officers, and at one time they were paid separately?—I would put it in this way, that supposing you pay an Inland Revenue officer 200*l*. a year, if you took these returns away you would not pay him 195*l*. You do not quite allocate salaries and duties with that extreme precision.

36,963. The Inland Revenue officers, I believe, have complained very much of this duty, and of not being paid for it properly?—Yes, that is so; there have been complaints by the Inland Revenue officers, but the matter is one for the Board of Inland Revenue and for the Treasury to consider, and not for the Board of Agriculture. We should be very glad to see everyone engaged in the collection of these returns very happy and contented in doing the work; but we have no power ourselves to interfere with regard to their salaries, and we are not in a position to form any opinion on the subject.

Returns of sales of cattle by live weight.

36,964. (*Mr. Clay.*) With reference to the sales by live weight I would like to ask you whether your returns are increasing?—Yes, there has been an increase in the live weight returns, especially in Scotland. The returns in Scotland are much more reliable than in any other part of Great Britain.

36,965. I understand it is your order that at every market they must have a weighing-machine?—Not quite that; we can upon the provision of weighing accommodation.

36,966. (*Mr. Little.*) And you have a dispensing power?—Yes, we have dispensing powers as well.

36,967. (*Mr. Clay.*) If it is by your order that the machines are there, why do you not make the carrying out of the system compulsory?—We have been endeavouring for some time past now to secure the provision of weighbridge accommodation wherever there seemed a reasonable probability that it was required. There are some very small markets where it would be unwise to require it, but in very many cases it has been provided in deference to our orders.

Mr. T. H. Elliott. 30 Nov. 1894.

Compulsory sale by live weight.

36,968. I have seen several of your orders carried out for providing these large weighbridges for store cattle and fat cattle, but I have never yet seen them used and they are standing idle; and without a compulsory Act making people use them for the general good of the buyer and the seller, your order cannot be carried out at all, but will remain a dead letter?—I am afraid that it would be impossible for us to prescribe by order the way in which people should do their business. From a theoretical point of view there is a great preponderance of opinion, as it seems to me, in favour of the sale of cattle by live weight; but if Parliament were to prescribe by an Act of Parliament, or if the Board of Agriculture were to say by an order that no cattle should be sold except by live weight, I am perfectly satisfied that a great many persons would take no notice either of the Act of Parliament or the order of the Board of Agriculture. There are some things which orders of the Board cannot do, and I am perfectly certain we could not do this. We can advise people; we can issue information; we can encourage the practice, and we can provide facilities for it, but we cannot compel them to sell and buy cattle by live weight if they do not care to do so.

36,969. Still at the same time you bind all corporations and bodies commanding markets to put up machines at their own expense?—That is a requirement of an Act of Parliament, and the Board of Agriculture only act in this matter in accordance with the provisions of the Act of Parliament.

36,970. Would it not be possible, as in America, to have a *bonâ fide* selling by live weight compulsorily through an Act of Parliament?—I feel very sure that the farmers and cattle dealers in this country would very much resist and resent and ignore any compulsory requirement as to the mode on which they should buy and sell. We should like to encourage them to sell by live weight, and we hope that they will see the advantages of doing it, but to make them do it is a very different thing.

36,971. I grant you butchers and such people are themselves against it, but the farmers surely would think it to be to their advantage?—The Board are not in any way opposed to the sale of cattle by live weight; on the contrary, they view the sale of cattle by live weight with considerable favour; but that is no sufficient reason for compelling people to sell in that particular way.

36,972. But you grant that the selling by live weight is increasing?—Yes.

36,973. And you think if it was extended still further it would be an advantage to agriculture?—I think it would.

Value of annual and quinquennial agricultural returns.

36,974. (*Mr. Little.*) You have been asked some questions by Mr. Giffen as to the value of an annual return; would not one of the reasons for objecting to a quinquennial return, or a return at longer intervals, be that you might happen to come upon a very exceptional year?—Yes, that is so; we should be deprived of the means of obtaining an average for a quinquennial period as I have done in one of the returns which I have put in.

36,975. Suppose you fell upon a year like 1893, a considerable misrepresentation of average facts would be given?—Yes, that is so.

36,976. And if you fell upon a year like 1894 there would be a departure from the general average as a sort of rebound from the previous year?—Yes.

36,977. That is to say, certain crops would be exaggerated in area and others diminished because of the previous exceptional year?—Yes, that is so; there is always a danger in taking single years.

36,978. It is a fact, is it not, that though the cultivation of wheat is diminishing steadily, in the returns of 1894 there are only one or two counties where the growth of wheat had not increased since the previous year?—Yes, I believe that is the case.

36,979. The returns of 1893 or the returns of 1894 with regard to the number of sheep would make a difference of about a million and a quarter sheep, I think?—Yes, I think so.

36,980. An important fraction of 16 millions?—Yes, you would undoubtedly have fallacies of that kind if you simply had returns every five years.

36,981. Is there not also this advantage in an annual return, that you get a staff trained to the collection which you would not have if it were an intermittent return once in five years?—Yes, there is a great advantage in continuity of work of this kind.

36,982. And you get men who are somewhat familiar with the parishes that they have to collect returns from, and who therefore spot an exceptional return?—Yes.

36,983. And detect errors?—I should say generally that comparison and examination is much more easy under a system of annual returns than under a system of returns every five years.

Collection of produce returns.

36,984. With regard to your produce returns, have you had any complaint as to the accuracy or inaccuracy of those returns?—No, I think not; my attention has never been called to anything in the nature of a general criticism of those returns.

36,985. You think they are regarded as fairly satisfactory?—So far as my knowledge goes, I think they are regarded as fairly satisfactory.

36,986. At any rate, for the purposes of comparison, if not absolutely correct they are relatively correct, that is to say, comparing one year with another, they would not be far wrong, though they might be wrong as to the actual produce?—Yes. I do not quite see in what way it would be possible to improve them, I have never seen any proposition for any very substantial change in our present machinery; on the other hand, I have heard commendations of our system as compared with the system adopted in other countries, especially in the United States.

36,987. Do you think that the fee which you are able to pay is such as secures the services of competent observers?—I think so, although it is not a very large fee.

36,988. It is less than 5*l.* 5*s.* for each return, is it not?—It is not very large. So far as the Board of Agriculture are concerned they would not be sorry if it were larger, but I do not think we have sufficient grounds upon which to propose an increase of the charge.

36,989. You do not, I suppose, get these returns through the same machinery as the agricultural returns?—No.

36,990. You have specially employed recorders?—Estimators; and that is the reason why a special charge is put upon the vote every year, amounting, as I stated, to 3,100*l.*

36,991. Can you say what sort of area an estimator has to deal with? Is there any uniformity in that respect?—There is a certain uniformity. The number of estimators employed is about 260.

36,992. For England or for Great Britain?—For Great Britain.

Collection of statistics of prices of meat.

36,993. With regard to obtaining records of prices as recommended by the Markets Commission, that recommendation was not confined to prices of live meat, was it?—No, it was with regard to the prices of commodities generally; but of course the commodities in which we have any interest are commodities which in some way or other touch the agricultural work of our own country.

36,994. One of their recommendations was: "It is "desirable to collect statistics for the market prices of "meat." That includes both live and dead meat, does it not?—Yes, evidently.

36,995. You do publish in the agricultural returns certain estimates of the prices of meat in various markets, do you not?—Yes, but we are not altogether satisfied with those prices. We should like to improve the system and to make those prices more accurate than they at present are. I do not wish to disparage them, but there is no doubt room for improvement in regard to those prices.

36,996. Do you adopt them?—We issue them for convenience of reference as being the best information there is, but we think the information might be better.

36,997. I think there are certain markets which you take, the figures of which the Registrar-General supplies?—Yes, I believe that is so—we issue the information that is available rather than none at all.

36,998. Do you happen to remember the evidence before the Markets Commission on that point, as to the value of those returns or the means by which they are collected?—No, I do not; I have not looked at the evidence apart from the recommendations on this particular subject.

36,999. You do not remember that it was there proved that they were taken from newspaper reports?—So far as regards the Registrar-General's returns, I know that that is the case.

37,000. Do you think that the Board of Agriculture would be able to do something in this way if the Treasury would enable them?—Yes, I think so. I think that with a comparatively small expenditure we could very much improve our statistics of agricultural prices.

37,001. And you concur in the opinion of the Markets Commission that it is desirable?—Certainly.

Sale of cattle by live weight.

37,002. (*Mr. Chaplin.*) I understand the Board attach great importance to the question of the sale of cattle by live weight, and that they regard it as a great advantage to the farmer?—Yes, so far as their information goes they have reason to think that the practice is a very desirable practice.

37,003. And you have done a great deal to secure the necessary accommodation, but it is not sufficiently used, I understand?—It is more used in Scotland and in some markets than in others, but we are certainly disappointed at the extent of the use made of the machines which have been erected.

37,004. Can you give the Commission any reason for that—why that should be so?—I think it is simply the disinclination on the part of farmers and cattle salesmen to change their practice. I have heard it stated that there is a strong disinclination on the part of cattle salesmen to purchase cattle by live weight, but I am not quite clear as to the evidence upon which that is founded. I am inclined to think there is a considerable inertia to overcome, and that trade practice is a difficult thing to modify.

37,005. It is partly inertia and partly ignorance on the part of the farmer I suppose, and partly hostility on the part of the salesmen and the butchers?—I should hardly like to use the word ignorance in relation to the farmers, or hostility in relation to a particular trade; I would rather say that there is inertia to be removed.

37,006. Have the Board considered any plan for making the system more effective?—Of course, we have before us from day to day the cases of individual markets, and we have gradually brought pressure to bear upon market owners to provide facilities. I do not know that we can do very much more. We should be quite willing to do more if we thought it would serve a useful purpose. There is every desire on our part to encourage and stimulate the practice of selling by live weight by every legitimate means.

37,007. (*Mr. Clay.*) You have admitted, I think, that it is a useful practice to sell by live weight?—Yes. We think it a distinctly advantageous method of sale; I think all the evidence goes to support that view, but still the Board would hesitate to propose that it should be made compulsory by Act of Parliament.

37,008. (*Mr. Chaplin.*) Have you got no evidence to this effect: that there is direct hostility to it on the part of butchers and salesmen, and that at some times it has been said there is an absolute ring formed against it; have you got no evidence to that effect?—I have heard statements to that effect, but we have no original evidence upon which I should be justified in expressing an opinion.

Collection of statistics of prices of meat.

37,009. You referred to the recommendation of Lord Derby's Commission with regard to the collection of statistics of the market prices of meat, but there I understand the Treasury is rather the difficulty; is that so?—No; I hardly want to put it too strongly as against the Treasury. As a matter of fact, we have made no proposals to the Treasury, because, as I stated, there were other matters which we considered should take precedence. Undoubtedly we shall, I hope at no distant date, make some proposals to the Treasury on this subject, and if we have a recommendation from a Royal Commission that will undoubtedly strengthen our hands with the Treasury.

37,010. I think I gather that you are pretty clearly of opinion that if you had the requisite means at your disposal you think a good deal more could be done in

Mr. T. H. Elliott. 30 Nov. 1894.

this direction with advantage?—There is no doubt whatever about that. If we had funds at our disposal we should do it to-morrow, but we have, of course, to make good our case for further expenditure in every direction.

Definition of the term "out of cultivation."

37,011. Now, with regard to the quantity of land out of cultivation, one difficulty I apprehend in connexion with that question is the definition of the term "out of cultivation," and arriving at exactly what it means?—Yes, that is so.

37,012. What meaning do the Board themselves attach to the term?—The term is not one that the Board have occasion to make use of in connexion with their returns. The returns constitute the whole basis of our information on the subject. The meaning that I should personally attach to the term "out of cultivation" would be land which is not cultivated or used for any purpose incidental to agriculture. But that of course is an extreme statement of the position of any land.

37,013. Of course you are aware of the position that exists at the present moment in many counties, namely, that there is in some, or at all events in one very large area, and in some others a considerable area, in some others a smaller area of land which is commonly described as having gone out of cultivation. Of course the Board, I assume, are aware of this state of things?—We are aware of the statements which have been made on the subject, but our information is confined to our returns. It is extremely difficult to compare the statements to which the Commissioner refers with our returns.

37,014. I understand you cannot give us any clear information on the subject from any information that is in your possession now?—No, I think not.

37,015. But if a clear interpretation of the term was laid down there would be no practical difficulty in getting the information, would there?—Of course the present returns are based absolutely upon the information supplied by the owners and occupiers. In the event of the Commission wishing any further statistical information on this subject we should have to consider whether that information could be obtained by direct application to the occupier, or whether some special machinery should be created, or whether the Inland Revenue officers should be asked to make estimates for their different localities.

37,016. Of course you understand that this is a very important matter for the consideration of the Commission if information can be obtained upon it. Can you, as representing the Board of Agriculture, suggest to us any means by which information as to the approximate amount of land which has lapsed into this unfortunate condition in various counties could be obtained?—My difficulty in replying to that question is based very much on the fact that we are not yet aware of the class of land which is within the category to which the Commissioner refers. We know our returns and we know the headings of our returns, but "land out of cultivation" and "derelict land" are expressions of which we do not know the precise meaning attached to them by those who use them.

37,017. But is that not a matter to which the Board might turn its attention with some advantage just at present?—We should be very glad to consider any suggestions for the re-arrangement of our returns, but at present all that we can say is that there has been either a diminution or an increase in the acreage under all kinds of crops, under bare fallow, and under grass. The expression "under grass" is obviously a very elastic expression. There is a good deal of land which in one sense may be said to be under grass which comes under the heading of mountain or heath or rough grazing land. The variations and shades as between fully cultivated land and land not in cultivation at all are infinitesimal; it is like a rainbow, if I may use the analogy.

Possibility of ascertaining estimate of land out of cultivation through the Land Office Inspectors.

37,018. Quite apart from the question of returns or statistics, would it not be a matter of comparative ease for the Board to obtain this information in this way: you have a great number of inspectors, I believe, attached to the Board, leading agriculturists, in almost every county in England and Wales; is that not so?—The inspectors attached to the Board are not in a true sense our inspectors. They are really gentlemen who may be appointed inspectors for the purpose of particular business, usually under the Lands Improvement Acts. Their whole time is not at our disposal. They are gentlemen whose occupations are very multifarious and very pressing, and we cannot use them in the way in which a Government department ordinarily uses its inspectors. One of the points to which I propose subsequently to call the attention of the Commission is the absence of facilities for obtaining information throughout the country.

Mr. T. H. Elliott. 30 Nov. 1894.

37,019. You have these gentlemen attached to the Board although they are not ordinarily called inspectors, and I understand they are men most eminent in agriculture and well acquainted with the conditions of their different districts in almost every part of England; would it not be possible to get information without great difficulty from them upon these points? I may tell you that we addressed inquiries to a vast number of these gentlemen on this very subject earlier in our proceedings, and we have now a return before us which is called "Answers to the inquiries addressed to the Land Office Inspectors of the Board of Agriculture." One of the questions they were asked was this: "Has any land gone out of cultivation in your district"; and from some 16 or 17 of these gentlemen we have replies to the effect that more or less land has gone out of cultivation. Would it not be perfectly possible for the Board to obtain information for us on that subject rather more in detail from each of these inspectors?—I think the more convenient course would be that the Commission should itself ask the inspectors to supply that further information. I myself do not see that the intervention of the Board is of any real value. If the gentlemen in question were our officers in the sense that we could always control their services, I should say that it would be, but this is not the case, and I cannot see that the intervention of the Board would be of any real practical value.

37,020. Has there ever been any difficulty whatever in obtaining the fullest information from these gentlemen on points of importance affecting agriculture whenever it has been demanded by the Board?—References to these gentlemen are becoming rather more difficult than they used to be, because suggestions are now so much more frequently made that we should obtain their assistance. Naturally these gentlemen, most of whom are engaged in professional work, are unable to give their time without the payment of a fee. They are not salaried officers of the Board, and consequently a fee should be paid whenever we apply to them for information. Some of them, I am bound to say, are very willing to give us information without the payment, but others raise the question. The whole position of the Board and these inspectors with regard to inquiries which really do not fall within the scope of their work is unsatisfactory. We ask a professional man to give up a considerable amount of his time and to devote a considerable amount of thought to answering inquiries, and we are not at all clear whether we can remunerate him or not. I may say, generally, that on this account we often have very grave hesitation now in referring to these inspectors for assistance.

37,021. It is within the option of the Board, I suppose, to pay for their services whenever they think it necessary?—No, the Board would have first of all to obtain the approval of the Treasury for the expenditure of the money.

37,022. And, as a matter of fact, then if we were to ask you to obtain for us, and if it were possible to obtain this information that we desire in the way that I suggest, we should be asking the Board to do something which would add to the expenses of the department?—Undoubtedly that would be so.

37,023. And that would be one objection to obtaining the information?—That would be an objection from our point of view.

37,024. You have something further to say to us on the question of these inspectors later on, I think?—I have something to say to the Commission generally as to our means of obtaining information on agricultural questions. We are very conscious of our deficiencies in that direction.

37,025. (*Viscount Cobham.*) Many of these gentlemen could not really give the time, could they, even if they were remunerated?—If the Board or any public body ask them for information, naturally they rather strain a point in order to obtain it, but they are gentlemen who are full of pressing and important professional engagements.

Agricultural Department of Hungary.

37,026. (*Mr. Chaplin.*) Are you acquainted at all with the Agricultural Departments in foreign countries,

Mr. T. H. Elliott.

30 Nov. 1894.

such as Hungary and Austria? I will take the case of Hungary first; are you acquainted with it?—I have certain general information upon it. The Board are not in possession of any more information, I think, than the Commission already have before them. There have been certain parliamentary papers on the subject and certain special inquiries have at times been made.

Increase in cultivated area.

37,027. (*Mr. Dalton.*) Might I go back to a question that I put somewhat earlier to-day with regard to the amount of the apparent increase of the land under cultivation; judging from these returns, the land under cultivation has increased by a million and a half acres since 1873?—Yes, that is so.

37,028. And the woodlands and plantations have increased by half a million?—Yes, so far as the two returns to which I have referred enable a comparison to be made.

37,029. According to these figures—I am taking the figures from 1873 to 1893—— ?—Yes; but as I pointed out to the Chairman, there are notes to those figures which explain that the years 1873 and 1893 are not the years in which the returns were made. As between the two returns a substantial increase is undoubtedly shown.

37,030. In the years 1873 and 1883 you have no figures as to the mountain and heath land used for grazing, have you?—No, we commenced obtaining information on that point in 1892.

37,031. Therefore, practically in those first two years you had no wiping-up column which would enable you to get roughly at the total acreage of the whole country?—That is the case.

37,032. The effect of that, I suppose, has been to make the returns for those years as to the land under cultivation less trustworthy than they otherwise would have been?—In the earlier years?

37,033. Yes; the years 1873 to 1883?—That is so, undoubtedly. It would be quite possible that some of the land now returned under the heading of rough pasture land and unenclosed mountain and heath land may have been previously returned under the heading of permanent pasture; that I think is quite possible.

37,034. Of course, if the figures are correct as they stand, you have two million acres taken from the mountain and heath land used for grazing, and added practically to land under cultivation and under forest?—Yes.

37,035. I suppose that you would not consider that that would accurately represent the fact?—I can hardly say so; it seems to me a surprising fact, and I cannot help thinking that it probably is in excess, and possibly greatly in excess of the real position, but there are the figures.

37,036. What I want to point out is that there was in the earlier years no wiping-up column to enable you to verify them year by year?—No.

37,037. Therefore you would not feel that much reliance could be placed upon the fact that a million and a half more acres have really come under cultivation in the popular sense of the term?—No, I should think there has been an increase, but that probably the increase is not so great as the figures would suggest.

Increase in area of woodlands and plantations.

37,038. Going to the subject of the woodlands, I think a little light might be thrown upon that by referring to another table which you have in your statistics which shows that the plantations which have been planted out during the last ten years only cover 102,000 acres. At page 35 of your statistical return you have woods (except plantations) 2,591,000 acres; plantations planted during the last 10 years 102,000 acres; is that not so?—Yes, that is so.

37,039. So that you only have during the 10 years an increase of practically 102,000 acres under wood, whereas according to the other statistics you have in 20 years half a million, that is five times as much?—Yes, those are the figures.

37,040. That would throw considerable doubt upon the earlier figures, would it not?—Yes. I am afraid it is not possible to go more closely into the details of the previous return, but I should think the inference you have drawn from the figure is a correct one.

Increase in cultivated area.

37,041. What I was anxious to get at is this: We have heard of land going out of cultivation, and we have here apparently a very great increase in the land under cultivation, and I want to know whether you think there has been an increase in the amount of land actually under cultivation, or whether you think it is possible that there may have been an error in the earlier years?—I can come to no other conclusion than that there has been an increase. I can scarcely think that a mere improvement in the accuracy with which these returns are made and collected would be sufficient to account for so large an increase. Of course it is notorious that reclamations and extensions do go on in certain parts of the country. That would be shown if you were to analyse more closely the figures as between the districts in which enclosures and reclamations can be made, and those in which they cannot be made. Many of the increases, I think, will be found in the northern counties of Scotland, where there is great room for enclosure.

Mr. T. H. Elliott.

30 Nov. 1894.

37,042. Do you think that they will cover the greater part of the million and a half?—Yes, I think so.

Land out of cultivation and the returns of acreage under crops, bare fallow and grass.

37,043. (*Mr. Little.*) Do I understand that what Mr. Dalton speaks of as uncultivated land is still included probably in the "area under crops, bare fallow, and grass"?—Yes. I understood that Mr. Dalton's questions were rather directed to the increase in the total acreage under crops, bare fallow, and grass, which seemed to him rather at variance with the general opinion as to the course of agriculture.

37,044. I understood Mr. Dalton to say that it was remarkable that while land was going out of cultivation the cultivated area increased—but the land out of cultivation is included in the total area under "crops, "bare fallow, and grass"?—I could hardly say that land out of cultivation is included in the cultivated land.

37,045. Is it not the fact that land which is described ordinarily and in common phrase as having gone out of cultivation is still land "under crops, bare fallow, and grass"?—Of course, if it is so returned by the owners then it so appears in the return, and if owners take the same view that the Commissioner has just expressed, then it would appear in the return.

37,046. (*Mr. Dalton.*) The point I wish to make is rather this: that in the present depression of agriculture, which has gone on now for a considerable time, it seems a startling fact that anything like this enormous area of land should have been brought under any kind of cultivation after having been mountain and heath land. I should have thought that, at any rate, it would have been very difficult to have found that two million acres, or a million and a half of acres of what would be ordinarily mountain and heath land, had been brought into cultivation during the time when this depression has been going on?—I should think, as a matter of fact, much of the land returned under the heading of mountain and heath land differs very little indeed from land which is described as permanent pasture, excepting in the fact that it is unenclosed. In the hill countries especially, the land which is enclosed, and which is returned under the head of permanent pasture, differs at a certain point scarcely at all from the land included under the head of rough grazing land and mountain and heath land. "Under cultivation" is a term which scarcely represents the position of much of the land returned as permanent pasture. As I said in reply to Mr. Everett, "cultivation" is a loose expression, and the proper way of describing the land within what we call the cultivated area is: "Total acreage under all "kinds of crops, bare fallow, and grass."

37,047. (*Mr. Little.*) Just to clear up those points that Mr. Dalton has been urging, may I ask you to refer to the returns of 1884 as to the total area under "crops, bare fallow, and grass," and to compare them with those for 1894?—I have the figures for 1883 and 1893 only.

37,048. I have 1884 here, if you will allow me to quote the figures from it. In 1884 there were 24,844,490 acres, and in 1894 there were 24,880,717 acres. That is practically the same quantity, and there has not been even an apparent increase of more than 36,000 acres in the area in the last 10 years?—That, of course, is for England. If I may take, practically, the same figures, that is, if I may take 1893 as compared with 1883, which are the years for which I have the figures here, here is an increase of 102,000 acres in England, 56,000 acres in Wales, and 100,000 acres in Scotland; and of course the increase of 100,000 in Scotland and 56,000 in Wales is much greater in proportion than the increase of 102,000 in England. I only mention that as showing that in the hill districts a good deal of reclamation and enclosure bringing land within the area of permanent pasture has taken place.

Mr. T. H. Elliott.
30 Nov. 1894.

37,049. My figures, which were for England alone, show that in 10 years there was an increase of 36,000 on 24 millions?—Yes. I might supplement that information by stating that of the 102,000 additional acres in England in 1893 as compared with 1883 there was an increase of 26,000 in Cornwall, of 27,000 in Lancashire, of 16,000 in the North Riding, and of 12,000 in the West Riding—all of them districts in which the bringing of land into the area of permanent pasture might very likely take place.

37,050. All of them districts in which there is a large area of moor land?—Yes.

37,051. (*Viscount Cobham.*) One or two large mountain commons, I think, have been enclosed in those counties?—Yes.

37,052. (*Mr. Dalton.*) When you get these statistics that we are speaking of now from a particular area, have you any means of checking the figures by the total acreage of that year; I am not quite sure for what areas you get them. Do you get them for unions?—We get them for parishes.

37,053. Then it is possible to check them from the census, is it not?—It has been suggested that the Inland Revenue officers should be supplied with the total area of the parish, but I am not quite sure whether this is done.

37,054. That would a great safeguard?—Undoubtedly.

Statistics of rent of and expenditure upon agricultural land.

37,055. Do you have any statistics as to the rent of agricultural land?—None whatever.

37,056. Nor as to the expenditure upon the land?—No.

37,057. Do you think it is desirable to have that?—I think so. I think any information on the subject of rent, or on the subject of either landlords' or tenants' expenditure, would be extremely valuable. The facts of the matter cannot be too widely known.

37,058. It would be practicable to get those facts, I suppose, without any very great expenditure?—I am not quite clear how you can get them. A certain amount of information as to rents and values can be obtained from the Inland Revenue Office, but when you come to expenditure you come to a matter upon which people are very unwilling to give any information.

Method of collection and publication of corn returns.

37,059. (*Mr. Lambert.*) I just want to ask one question on the method of collection and publication of the corn returns by which the value of the tithe rentcharge is annually determined. What parts of England do you principally get these returns from?—A list of markets at which returns are to be collected is set out in a schedule to an Order in Council which was revised by the Board of Trade some years ago. If necessary, I could put in a copy of the list which would show that returns are made in practically all the leading markets in which corn is sold and bought.

37,060. Then you would not be able to say whether the west of England is as well represented in the list as the east?—I have not a list of the returns with me, but there is no difficulty in obtaining that information. Certainly the idea that the Board of Trade would have had in framing the list was to include every market in whatever part of the country in which corn was bought or sold in any reasonable quantity.

37,061. (*Mr. Giffen.*) Is there not a list of the towns in the Annual Blue Book about the corn returns in which the amounts returned at each market are stated?—Yes, that is so.

37,062. (*Mr. Lambert.*) Then in taking into account these corn returns you do not take into account the corn that the farmer consumes at home?—That is so. It is simply the corn bought and sold.

37,063. Have you heard of any particular grievance amongst farmers that it is only the best corn that these averages are taken from?—That was one of the matters considered by the Select Committee which sat under the chairmanship of Mr. Jasper More. The Committee did not recommend any alteration in the law in this respect.

37,064. After all there is very considerable dissatisfaction amongst farmers, and you have heard it expressed. I presume that it is only the best corn that is taken into account in estimating the tithe rentcharge?—Yes, that is so; and as I stated to the Commissioner the complaint is one which was brought before Mr. Jasper More's Committee, and it was considered by them in detail in their report. The Committee was a very strong one, and the fact that a Select Committee of the House of Commons has considered the grievance, and has not seen its way to recommend any alteration in the system, is a factor which must be borne in mind.

Mr. T. H. Elliott.
30 Nov. 1894.

37,065. (*Mr. Everett.*) On the same point then you have not found any elasticity of operation open to you by which you could deal with the exceptional circumstances of a year like the present in which in the eastern counties I should think not more than half the barley grown will come to market at all, and the half that does not come to market would not on the market make above half the price of what actually will go to market?—No, no elasticity is possible. We are bound by the provisions of an Act of Parliament, and the system adopted is exactly the same year after year. We have no power to vary it.

Prices of live stock.

37,066. (*Lord Rendel.*) I think you said in your evidence-in-chief that you are able to obtain statistics of the prices of live meat from 15 markets only?—That was with reference to the prices of cattle sold by live weight. There is a schedule to the Act of Parliament of 1891, which specifies the principal cattle markets in the country. I am sorry to say that the returns which we have received from those markets have not in every case come up to what we think is the proper standard of excellence, but we are endeavouring to bring about some improvement.

37,067. But you attach importance to those?—Certainly.

37,068. They would be very distinctly beneficial to the grower?—There is a general recognition of the value of good statistics of prices so that the course of the markets may be very obvious to every one.

37,069. At present the markets may prove more unfavourable in many cases than the old system of private dealing, I suppose?—I do not know whether that would be so; I have not sufficient practical knowledge of the trade to say that; but I should suppose that a market would be a beneficial thing for all concerned, and that in the multiplicity of transactions you get a better means of disposing of the produce.

37,070. But assuming that the markets were found to some substantial degree disappointing in that respect the Board of Agriculture would greatly desire, as far as you know, to extend their present system of securing returns as to prices?—Yes. We do not get very satisfactory returns from the markets to which I have referred. We ought to get better ones, but I do not think as a matter of practical administration that we are likely to do so without a further expenditure of money.

37,071. But that additional expenditure would not amount to any serious thing, would it?—No, it would not amount to anything at all serious.

37,072. And the machinery would be very easily found?—I think we should be able to do it without much difficulty.

37,073. (*Mr. Giffen.*) Would it alter the average of corn prices by the slightest fraction if we got better returns from these 14 markets?—I was not referring to the corn returns, but to the prices of live stock. With regard to the corn returns, I think they are about as good as any statistics of that kind are ever likely to be. They really are very good, and I doubt whether any improvement in the machinery would alter the price of the corn by a farthing.

Method of collection of corn returns.

37,074. (*Mr. Lambert.*) Without taking into account the waste corn?—That is another question, of course. I was simply speaking as to the question of machinery; the question of the principle on which the returns are made is of course another thing.

37,075. (*Lord Rendel.*) The success with regard to corn would only bring out into greater prominence the comparative failure with regard to live meat?—In the case of corn you have long standing custom and tradition. The corn returns are statistics which have been in existence for over a century. You have there a well-established system, and there is a very good general knowledge on the part of those concerned as to what is required. But in regard to other commodities we have to build up a system, and it will be many years before we can possibly hope to have such good statistics as to the prices of stock as we have with regard to the prices of the three cereals.

Prices of live stock.

37,076. Viewing the growth in relative importance of meat as compared with corn, the impriority of statistics as regards the returns of prices of meat

Mr. T. H. Elliott. 30 Nov. 1894.

becomes more serious?—Yes; we should quite recognise that, and that is one of the reasons which led us to look for some improvement in that direction. I may say that the Board are extremely anxious to obtain better statistics as to the price of stock.

37,077. (*Mr. Everett.*) In our part of the country you would get them most accurately and easily from the leading auctioneers on the market, but it would entail a fee, probably?—I have been using the word market as including the auction marts. There are some big auction marts which are really of more importance than many of the markets. But in all those cases the payment of a small fee would probably ease the matter very much.

37,078. You have very full returns of the quantity of corn of various kinds imported, as well as the produce of this country. I think they are given in the agricultural return?—We include them in the volume for the purpose of convenience; but they are collected by the Board of Trade through the machinery of the customs.

Consumption of meat.

37,079. Have you any returns showing the quantity of meat which is sold for consumption, having regard both to the product in England and the imports from foreign countries?—No. I have seen calculations made as to the quantity of meat available; in fact, I have supplied certain information to Parliament with regard to the quantity of meat which has been taken into consumption in certain years.

37,080. Do you know whether the consumption per head of the population has increased or no?—I am satisfied that it has.

Consumption of wheat and flour.

37,081. Have you ever estimated the consumption of wheat and flour per head, foreign and home grown, of the population of the United Kingdom?—I should think it would be somewhat difficult to make any estimate as regards the flour.

37,082. I mean added together; I do not mean distinct from one another, but in the gross?—Some calculations of that kind might be made, but there is always an element of uncertainty in any calculations of that kind.

Duties of the intelligence branch of the Board.

37,083–4. (*Chairman.*) Will you now proceed to the second branch of your evidence which deals with the intelligence branch of your department, and will you state what has been done in that respect?—Perhaps I might in the first instance state to the Commission generally what the duties of the intelligence branch are. We note and abstract information transmitted by the Foreign Office respecting agriculture in foreign countries and with reference to the diseases of animals abroad; we note and translate information contained in the official returns of foreign and colonial departments of agriculture; we translate and digest as far as we can information from the foreign agricultural press and from veterinary and scientific publications; we collect and file information from the British agricultural and general press relating to agricultural questions; we make arrangements for the experimental exhibition of weather forecasts at rural telegraph offices; we prepare leaflets and special notices as to insects and experiments and other subjects, which we circulate as widely as we can; we have commenced the preparation and issue of the Journal of the Board of Agriculture, which is at present intended to be a quarterly publication; we compile from the foreign trade reports statistics of the trade in animals of foreign countries; we are endeavouring to form a library of reference, especially of the reports of foreign and colonial departments of agriculture; and we deal generally with correspondence relating to insect attacks and experiments and other similar subjects upon which letters are addressed to us. All this is new work which has devolved upon the Board under the Act, and we have always attached great importance to this branch of our duties. At the same time we feel that very much more remains to be done before we have reason to be satisfied with ourselves. We have a very small staff employed in connexion with this branch, and there is no doubt that sooner or later that staff will have to be strengthened if the work that we are doing is really regarded as of importance to agriculturists in this country. There are two matters perhaps as to which I might say we should especially value the opinion of the Commissioners; the first is with regard to the issue of the weather forecasts, and the second is with regard to the Journal.

Experimental transmission of weather forecasts.

37,085. Will you state what you think ought to be done?—Firstly, as regards the issue of the weather forecasts. In 1893 we made arrangements for transmitting the forecasts each afternoon to telegraph offices in the rural districts of the two counties of Essex and Northumberland for exhibition there. We thought it might be useful for the farmers that they should have an opportunity of seeing or of sending in to see what the forecasts were for the next day.

Mr. T. H. Elliott. 30 Nov. 1894.

37,086. (*Mr. Little.*) During what months?—During the months of August and September. As to the results obtained, I am bound to say that as far as we could get information on the subject, we did not think the appreciation was sufficiently keen to justify a very considerable extension of the arrangements. We decided, however, to repeat the experiment on a larger scale during the present year and over a more varied period, certain typical hay-growing counties being included in the scheme. We exhibited forecasts for eight weeks in June and July, for representative hay-counties, Somersetshire, Carnarvonshire, and Ayrshire; and in July and August for typical corn-counties, Cambridgeshire, the East Riding of Yorkshire, and Haddington. We are engaged in collecting information as to whether the work of the Board in this direction was of sufficient value to justify its continuance; but our information at present is not complete, and we are anxious to bring the matter under the notice of agriculturists, with a view to receive some expression of opinion as to whether a real practical value, sufficient to justify the expense, is obtained by the issue and exhibition of these forecasts.

37,087. (*Chairman.*) Were the forecasts realised?—The per-centage of successes was, we understand, considerable. There is no doubt that a considerable advance has been made in regard to these forecasts. They are supplied to us by the Meteorological Council, and in the report of that Council are given every year statistics as to the successes obtained.

37,088. How long ahead do they make the forecast?—We send out an afternoon forecast, but I believe there are two or three made during the day. Of course the forecast must be exhibited in the afternoon, so that a farmer may make his arrangements for the next day.

37,089. (*Mr. Chaplin.*) Is the expense considerable?—It would be certainly substantial if you took the whole of the country. I think last year, for the two counties, it cost about 260*l.*—at any rate something between 200*l.* and 300*l.*—a county.

37,090. (*Chairman.*) Does the forecast give the probable weather the next day?—It is the forecast which you see in the evening papers and at the clubs.

37,091. (*Viscount Cobham.*) For 24 hours?—It is rather less than that. It is telegraphed in the afternoon. The question, of course, is whether the expense is justified by the practical results obtained.

37,092. I suppose the same information is distributed to the various newspapers throughout the country?—Yes, that is so; but in many rural districts the newspaper is not available until the next morning.

37,093. How is the forecast communicated to the farmers in the rural districts?—It is telegraphed from the General Post Office here to the telegraph offices in the rural districts.

37,094. (*Mr. Chaplin.*) In all the villages?—In all the villages; and the postmasters put the telegram outside on their shutters or in their windows, so that the farmers can see the forecast.

37,095. (*Mr. Little.*) You have, in addition, some one on the spot who undertakes to record the result for you?—Yes; we try by that means to get information as to the success of the forecasts.

37,096. Those are volunteers, I presume?—Yes; we have asked our friends in those counties to tell us what results were obtained in order that we might see whether the experiment ought to be continued.

37,097. Shall we have the result of their reports soon?—Yes, soon.

Journal of the Board of Agriculture.

37,098. (*Chairman.*) What have you to put before us with regard to the other point, namely, the Journal?—We propose now to issue a quarterly journal, one number of which has appeared. That is an enterprise which is sanctioned for a limited period, and the continuance of it will depend very much upon whether agriculturists and the leaders of agriculture appreciate and find any value in the publication.

37,099. That publication would contain any information, I presume, which you would receive from foreign countries bearing upon the state of production?—Quite

Mr. T. H. Elliott.
30 Nov. 1894.

so. We should endeavour to make it a means of bringing the information that we get within the knowledge of the persons interested. I may say that the first number, judging from the sales, has been a distinct success; for we have sold, I think, about 4,000 copies of it, which is a distinct success for a Government publication.

37,100. Has it found its way into the hands of farmers in the rural districts, do you think?—That we hardly know yet. I should think it had to some extent; but that is a matter upon which we rather invite the expression of opinion.

Facilities for obtaining information upon agricultural questions.

37,101. Do you think it would be advantageous that you should have at your disposal better means of obtaining information upon agricultural questions?—Yes, distinctly. I should say, taking first our home information, that we look forward to the time when we shall have agricultural correspondents in each district from whom we can receive periodical information as to the position and prospects of agriculture in their respective localities, who would give us early information as to the appearance of disease and insect pests, who would keep us in touch with the various agricultural societies and farmers' clubs, and be a means of communication between us and our clients and our clients and us. At present we know little more as to the current position of agriculture at home than we learn from the newspapers and from chance correspondents, and I believe it would be of the greatest benefit to agriculture if closer relations could be established between the department and those actually engaged in the industry.

Scientific assistance at the disposal of the Board.

37,102. Do you attach importance to the increase of scientific assistance at your disposal?—Yes; that is a second direction in which we think that, at the present moment, we are insufficiently equipped. The Board feel that unless it can be said with certainty that science can do nothing more for British agriculture, there is obviously a legitimate field for work by the department; and we look forward to a considerable extension of our present means of usefulness in this direction. With regard especially to botanical science, we consider that some advance is very necessary, and we are at the present moment in communication with the Office of Works with a view to ascertain whether it would be practicable to make arrangements whereby the staff of Kew Gardens could give more continuous attention to matters affecting British agriculture. Our impression is that even taking into account the excellent work already done, and still being done, by private agencies for the improvement of agricultural staples, and in the way of agricultural experiment generally, there still remains something to be done by the Government in these directions, especially in the way of making widely known the results obtained. In fact, we want to be sure that botanical science well equipped and directed can do nothing more than is already being done for the improvement of the value of the agricultural product. I might mention also that we want to be in a better position to supply information to correspondents and to investigate plant diseases. Possibly the demonstration stations now coming into existence in connexion with the college centres and the county councils will also become research stations, the one class of work necessarily tending to the other; but some conjoining influence will be required, and this we hope by degrees to find ourselves in a position to supply. Of course work in the direction I have indicated may require that we should have access to land in various parts of the country. It may be that this will be possible through the present Office of Woods. We feel generally that we want to be better equipped in the matter of scientific assistance, and amongst the matters that I may mention as particular subjects in which we feel our deficiencies are forestry, entomology, vegetable pathology, and horticulture.

Issue of information obtained from foreign scientific and official publications.

37,103. Then have you anything to say with regard to information from abroad?—There again we feel that equally serious deficiencies present themselves. We receive a certain number of the leading official and scientific publications and newspapers, but the staff of the branch is, as I have said, a very limited one indeed, and I can scarcely say that there is such a prompt and complete examination of their contents as is desirable.

37,104. Will you give illustrations of that?—I think I may give at least two illustrations of the advantages of our being in a position to issue information promptly and efficiently to those concerned in practical agriculture. It was stated in a paper read before the Worcestershire Chamber of Agriculture in March last that Warwickshire farmers might have saved thousands of pounds if they had been reliably informed of the failure of the apple crop in Canada and the States in 1893. Early in June of that year, as it now appears, reports had been received indicating unfavourable prospects for apples, and in July official information was received to the effect that the prospective commercial crop of apples in the States would be light, and in many sections a complete failure. These reports were again officially confirmed in August. As regards Canada, official information reached the Board in August that apples were a failure in Ontario, and that the commercial varieties were much below an average crop in some districts of Nova Scotia. It seems certain that if we had been in a position to digest that information, and issue it promptly, that even if the statement made before the Worcestershire Chamber of Agriculture, namely, that thousands of pounds would have been saved to farmers in Warwickshire, was somewhat exaggerated, yet substantial good would have been done by the issue of that information. The second illustration which I would give has reference to the new potato disease, reported from the south of Scotland in March last. There is now reason to suppose that that disease is identical with one concerning which reports appeared in the German agricultural press as early as September of last year, and it was obviously very desirable that such information as was available on the subject should at once have been collected and summarised, so as to be available for publication in this country immediately on the appearance of the disease. I may say that we recently issued a leaflet as to the spraying of the potato crops as being of value in protecting them from blight, and that a correspondent of the "Belfast News Letter" was good enough to say that the spraying with the solution we recommended was tried last year, and was "found to be of infinite value in the protection "of the crop from blight." One farmer gave the writer of this letter his opinion "that the crop when "sprayed is worth at least 5*l.* an acre more than if left "unsprayed." I mention these things simply as evidence of what I have stated as our belief, namely, that practical value would attend a well organised intelligence branch of the Board of Agriculture capable of at once digesting and issuing information of this kind.

Mr. T. H. Elliott.
30 Nov. 1894.

Facilities for obtaining information from abroad.

37,105. Do you think that facilities should be given for obtaining that information from abroad?—Yes, I am very strongly of opinion that we are not sufficiently in possession of information as to what is going on in agricultural matters in the leading countries in which agriculturists are interested. We receive a certain number of reports from British consuls abroad on matters of interest to the agriculturists of this country, but our experience goes to show that in those countries, such as the United States, Russia, and the Argentine, and in Canada, and perhaps India and Australia, some special representative of the department is required, possessing adequate technical knowledge, and able to communicate to us for publication, if desirable, prompt information as to crop prospects, new modes and subjects of cultivation, and the results of scientific research in all matters affecting agriculture. A step in this direction was taken last year by the French Government, and the United States and Denmark have for some years past employed agents abroad. We view with favour developments of the department in these directions, because we believe that the value of the agricultural product can best be improved by the wide circulation of information of practical utility, and by bringing scientific knowledge and research to bear upon actual work in the field.

Appointment of agricultural attachés in foreign countries.

37,106. What kind of agents do they employ? Do they employ people of their own country, or people of the country in which the information is desired?—They employ people of their own country who get in touch with people here, and the interests here, which they are set to watch. Denmark especially has done very much to foster its butter trade by the appointment of a gentleman of considerable ability, Mr. Faber, who is constantly sending home information likely to be of value in the development of the butter industry.

37,107. Is he employed solely upon that or has he other duties, and does he merely give a portion of his time to the State?—I am not sure whether that is the case or not. I only know him as being connected with this work.

37,108. It would of course make a great difference in the cost of the arrangement whether you employed a

Mr. T. H. Elliott. 30 Nov. 1894.

person especially for the purpose, or whether you got the information from somebody who is employed on other matters?—On the other hand, there is a very considerable advantage in employing, for so important a matter of this kind, someone who is absolutely under the control of the Government. As regards crop prospects it is conceivable that a person engaged in trade might manipulate his information for his own private purposes. I personally attach the greatest importance to the absolute freedom of all persons engaged in work of this kind from any pecuniary motives. If I may say so I should regard anyone in our statistical branch, who in any shape or form had any commercial interest in trade, or who embarked on any speculation in corn, or anything of that kind, as a very undesirable member of our staff.

37,109. (*Mr. Chaplin.*) I want to go back to the last question for one moment. Where does the gentleman who you say sends information to Denmark about butter send it from, where is he stationed?—In this country.

37,110. (*Mr. Giffen.*) Can you give us any idea of the benefit to the agriculturists of the United States from the employment of these agents?—I have not made inquiries into detail as to that, but I am satisfied that the countries which I have mentioned are of such importance now to British agriculture, that it is of the very greatest importance to us to know what is happening there.

37,111. (*Chairman.*) Take the Argentine Republic, it would seem to be scarcely worth while to employ a man specially to be travelling about there and getting information?—I happened to mention the Argentine Republic, because the opinion is very general that the future of the Argentine is of very great importance to the agriculture of this country. The Argentine is very much spoken of and the possible development of agriculture in the Argentine has been the subject of reference in many quarters. I mentioned it as a country with regard to which I think it is very desirable that agriculturists should have a good deal more information than is at present available.

37,112. (*Mr. Chaplin.*) Is not Argentina the one country above all others from which we suffer most from competition in wheat at present?—I can hardly answer the question quite so broadly. I should say undoubtedly that we badly want information as to the prospects of wheat growing in Argentina.

37,113. (*Lord Rendel.*) Do you happen to know whether we have at present a Consul-General at Buenos Ayres?—We have consular officers in Argentina. I do not wish to disparage the help which we have obtained from our consular officers, but their training and experience, and their principal official interests, are not such as to enable them to give that special assistance to agriculture in this country which we think is desirable.

37,114. In cases where there is a consular agent with an adequate salary who is not supposed to be, nor in fact is engaged, in any trade or in commerce, would you then have some reliance upon the services of some member of his staff?—I would rather prefer to have an agricultural attaché, and I do not think the expense would be very considerable. The Consul-General has very elaborate official duties to perform. He comes mainly in contact with the people at the ports, and he is not by any means necessarily acquainted with the general run of agricultural questions. Although I am sure he would endeavour to give us as much help as he could, yet his agricultural work is to some extent subsidiary and supplementary to the main line of his official duties. It is an adjunct to his official duties, and not the main purpose. Excellent agricultural reports do not very much advance his consular prospects, as it were, not so much as in the case of a young agricultural attaché with an agricultural training, who might look forward if he distinguished himself and made himself useful, to a career in connexion with the Agricultural Department.

37,115. But practically is there not at present attached to the legation a commercial attaché?—In one or two of the countries named there is a commercial attaché, but the same objection I take it applies there, namely, that he does not sufficiently come in contact with agricultural affairs and agricultural interests. Then again I believe there would be quite sufficient agricultural work for one man. I may mention to the Commission that in the United States alone there are 330 agricultural newspapers published, and it would be very important—I do not mean to say that the agricultural attaché should read every one of the 330 newspapers—that he should keep himself in touch with everything that was going on in agriculture, so that we might have periodical reports as to the position abroad.

Mr. T. H. Elliott. 30 Nov. 1894.

37,116. (*Chairman.*) In the case of the Argentine Republic, would it not be better occasionally to send out an able and experienced agriculturist in order to have a special report, and then that that should be supplemented yearly by further information obtained through the consul of the progress of cultivation in the country?—Possibly I attached a little undue importance to the Argentine. I am by no means sure that such an arrangement would be sufficient. If Argentina develops, it may be very necessary that during the process of that development we should have a permanent representative there.

Information as to probable development of Argentina.

37,117. (*Mr. Chaplin.*) Has the Board any information now about the probable development of Argentina?—As regards the probable development of the Argentine, very little. We can give certain information as to the existing position. There is certain statistical information as to the facts in recent years; but whether the progress is going to be continuous, it is almost impossible to say.

Appointment of agricultural attachés in foreign countries.

37,118. (*Mr. Giffen.*) Have you ever thought of sending a man not quite so far as the Argentine Republic or distant foreign countries, but to the east of Temple Bar, for the purpose of inquiring into the information which is to be obtained there?—I do not believe that the information we want could be obtained just on the other side of Temple Bar. I do not believe that it is simply a question of reading newspapers, but I believe that it is a question of constant contact with agriculturists in these countries.

37,119. Are there not probably east of Temple Bar people who know everything about the Argentine Republic, having estates there and other means of information?—I am by no means sure that we could depend entirely upon their information. I would much sooner send out a young man who had had a good agricultural training, and who had got a career in front of him if he did loyal work for the department. Let him come in contact with agricultural affairs; give him, perhaps, 300*l.* a year, or something like that; and let him report direct to us. I would trust him much more than the man who was engaged in commercial pursuits himself, and who might give me as much information or as little information as suited his own interests.

37,120. The advantage would be that probably people east of Temple Bar are much abler than the great majority of the men whom your agent would find in the Argentine Republic, and have got the subject much better in hand as it were?—Of course, we should be very glad if such people would give us information, bu as a matter of fact they do not.

37,121. You have never thought of trying to get it in that way?—I am afraid I do not quite understand who the people are. Are they corn dealers, or what are they? There is a certain disadvantage in going to persons for information over whom you have no control, who may give you just such information as suits their purpose, and possibly their purpose is not your purpose.

37,122. But that would apply to getting information in the Argentine Republic itself?—I think it would be much easier in the Argentine itself to check the information. I would much sooner trust the results of a special inquiry by a man who knew what he was about, and who could test the facts on the spot if he pleased.

Agriculture and live-stock of foreign countries.

37,123. (*Chairman.*) Have you now in possession of the department any complete information regarding the production of wheat, maize, and so forth in other countries?—We could put in tables showing with certain exceptions the estimated total produce and the estimated average yield per acre of wheat, barley, oats, and maize in each of the years 1890, 1891, and 1892 for certain of the more important countries and colonies, and also the number of horses, cattle, sheep, and pigs in each year from 1887 to 1892. In the course of a few weeks these tables could be brought up a year later for the use of the Commission. We could also furnish the Commission with information gathered from the official publications of the respective Governments as to the imports and exports of agricultural commodities.

Mr. T. H. Elliott.
30 Nov. 1894.

Cost of production.

37,124. (*Mr. Chaplin.*) In addition to the estimated total produce and average yield per acre, can you give us any information as to the estimated cost of production?—I will ascertain whether we could give any information on that point.

Agriculture in the United States and Denmark.

37,125. Do you know how it can be obtained?—There have been two or three special publications recently issued by the United States, by Denmark, and in one or two other cases from which a certain amount of information could be obtained but any evidence prepared simply by reference to those publications, or simply consisting of tables that we could put in, would not afford anything like the same amount of information as was obtained for the Duke of Richmond's Commission by several of the assistant commissioners who were then appointed for special foreign countries.

37,126. With regard to what you said just now about America and Denmark, the information in their possession you have, I suppose, at the Board of Agriculture?—We have that at the Board of Agriculture.

37,127. And you could give us all the information that they supply?—Yes, we could summarise the contents of those publications, but we could not do more than summarise them, nor could we make ourselves responsible for the information they contain.

Future of foreign competition and prices.

37,128. Then with regard to the probable future of foreign competition, have you anything to say to us?—That is a matter upon which I feel that it is even more difficult for us to assist the Commission, and I doubt whether we can with advantage, with our present means of information, do more than place the Commission in possession of such facts as are known to us and leave the inferences to be drawn by others. We can, for example, state what have been the imports of grain and flour from the Argentine in recent years, but we should hesitate to make official forecasts of the future, and say either that the present figure will or will not be maintained or increased.

37,129. For the same reasons I suppose you have found great difficulty in prophesying what will be the range of prices?—We should find very great difficulty in making prophecies, and there is always the objection to official prophecies that they are usually worse than private prophecies.

Bounties on exports of agricultural produce.

37,130. Have you anything that you would like to say on the question of bounties?—We have prepared certain information as to the Argentine bounties on live cattle and preserved and frozen meats, and as to the Victorian bounties for the promotion of the agricultural dairy, fruit and wine industries, but the information is neither very complete nor up to date, and it would probably be better that the Commission should obtain information on the subject from representatives of the Board of Trade, and perhaps the Colonial Office. I may mention that last night I found that in 1889 a full return of the bounties on exports, other than those paid on sheep and sugar, was presented to Parliament, and probably the information given therein could be brought up to date without much difficulty. We have no direct information ourselves on the subject.

Appointment of agricultural attachés in foreign countries.

37,131. (*Mr. Giffen.*) About appointing these agricultural attachés for foreign countries, could you give us any idea what number you would propose to appoint?—I am always in favour of making new departures in such directions very tentatively. I should myself, if I had a free hand in this matter, begin by appointing one attaché in order to see how the plan worked, and whether we got value for our money. I should be even inclined to appoint him for a limited period, say three years.

37,132. You propose to appoint agricultural attachés whose sole business would be to see and to report, but you do not propose that they should have any mission of a different kind?—No; I think to keep us informed in a country like the United States of what was going on there in regard to agricultural matters would be quite sufficient to fully employ the time of one man.

37,133. That is somewhat different from the business of some attachés who are now attached, I think, to the Embassy at Paris and the Embassy in St. Petersburg?—Yes.

37,134. And whose business is more diplomatic than merely seeing and reporting?—Of course it is a question for consideration. Possibly I should describe the position better by saying that the person appointed should act as an agent of the Board of Agriculture rather than as an attaché to the Embassy or Legation.

Mr. T. H. Elliott.
30 Nov. 1894.

37,135. Is that not a new departure in our official practice altogether?—Yes, and that is why I do not advocate one method much more than another. I only want to secure some means of communication and of information in a country like the United States, which is of such importance to agriculturists here.

37,136. I asked you a little time ago whether you could give any information of the benefit which the United States agriculturist has received from these agents abroad appointed by the United States, and I think it would be very desirable if you could give us some information of what is meant by the advantage which the agriculture of a given country would receive from having official agents abroad to report upon agriculture of other countries?—I have endeavoured to give two illustrations of the benefits that would have accrued to British agriculture. First of all as regards the failure of the apple crops in the United States and Canada there is distinct evidence—at least it is so stated by those engaged in the industry—that if they had known very promptly of the probable failure of the apple crops in the United States and Canada in 1893 it would have saved them many thousands of pounds.

31,137. Did the agricultural newspapers in this country give no account of such an important matter?—No, I believe not. In fact, the speaker at the Worcester Chamber of Agriculture went on to suggest that there should be some bureau established for the purpose of supplying farmers with information of the kind.

37,138. Do you actually suppose that a Government department in matters of importance would anticipate what the newspapers are likely to do?—I believe that as a matter of fact we could in agricultural matters frequently anticipate what the newspapers would be likely to do. Agriculturists in this country are not so closely bound up together, there is not that constant communication and reference to newspapers as there is in commerce. The assistance of a Government department, I think, is much more likely to be advantageous to agriculture than it is likely to be advantageous to commerce.

37,139. Is that not rather a censure upon the agricultural press of this country?—No, I think not. I think to some extent it arises out of the essential conditions under which agriculture is carried on. There necessarily is less communication, less constant meeting on a daily exchange, than in the case of commerce.

37,140. Surely the agricultural press of this country is conducted with a good deal of ability, and nothing would be easier for them than to have files of the newspapers published in important countries like the United States which would tell them everything of great interest at least that was going on, likely to affect the immediate course of agriculture?—I have nothing whatever to say against the agricultural newspapers, which I read with great profit to myself, but at the same time I do not believe that the agricultural newspapers are, as a rule, such profitable concerns as to enable them to employ the same amount of agency abroad as in the case of many other industries. What I should propose would be to use the information we obtain and circulate it by means of the newspapers.

37,141. But I wish to know whether you really will be able to get any better information than what the agricultural newspapers may get with very great ease, and would probably get if it paid them to do so?—If we had direct representation in the principal foreign countries I have no doubt whatever that we should get information which the newspapers would be very glad to receive and to publish.

37,142. I put the question because my experience is rather the other way, namely, that in matters of immediate commercial interest and immediate money interest the free agency is always rather ahead of the Government than otherwise?—I think, if I may be allowed to say so, that it is extremely dangerous to argue from the analogy of commerce to agriculture. From what I have seen much more is necessary in the way of assistance on the part of a central Government department in regard to agriculture than it is in the case of commerce owing, I believe, to the entirely different conditions under which agriculture is carried on. Although it is very true that individual enterprise may do more for commerce than a Government department, yet, at the same time, I believe that in agriculture a Government department such as ours is can do very much. I do not think that there is

Mr. T. H. Elliott.

30 Nov. 1894.

really any analogy between the two; I do not think you can reason from one to the other.

37,143. I did not say commercial interests altogether; I said money interests; where there is money at stake the free agency would probably be ahead of the Government always?—I do not think it is so in agricultural matters.

37,144. But still you can give no other concrete illustration except that of the Canadian apples?—On the contrary, I have already given a concrete illustration in regard to the potato disease. Undoubtedly our representative might have given us further information with regard to the outbreak of the potato disease in Germany at a very early date, which would have been most important, and which would have enabled us to prepare for what was coming.

37,145. The agricultural newspapers in this country did not get hold of it?—So far as I am aware they did not. I would not like to commit myself absolutely to the statement that they did not, but the information which I have goes to show that we ought to have been aware of the matter at a much earlier date than we were.

37,146. I do not wish to imply that I dispute the value of a great amount of the information which is obtained by Government agents relating to commercial and other matters, but I am rather dealing with those questions of information which is to benefit people in trade or agriculture by telling them immediately what is going on just at the given moment; because I think that is much better obtained by private agency?—I have no doubt whatever that is so in the case of trade where there is great frequency of communication and constant use of the telegraph; but there is no doubt, so far as agriculturists are concerned, that this is not the case, and a great deal of the information we have issued has been appreciated by them and has been considered by them to be of practical value. We have been constantly pressed to do more in that direction.

37,147. That is immediate information bearing upon immediate crops and on what the immediate action of agriculturists ought to be?—Not necessarily by any means.

37,148. But that is the point to which my questions are directed, viz., information of that kind, because it is upon that ground that you have asked for the agricultural attachés?—What I should say is, that a good deal of the information which is telegraphed and comes through the usual commercial channels does not get to the actual producers of this country but gets to the distributors. I am not proposing that we should endeavour to help the distributors, who, I think, can very well take care of themselves; but I should like to get more information into the hands of the producers of this country as to what is going on in regard to production in foreign countries, and I believe that the producers of this country would value that information. If I may take the case of the apples, which was said to represent a matter of many thousand pounds to the Warwickshire farmers, it is quite possible that the dealers here may have been in possession of that information, but the producers were not in possession of the information.

37,149. Then your evidence now rather points to the distribution of the information, and my question in that case would be: Could you not, as a department, have got information about the Canadian apples from a Canadian newspaper without sending an agent all the way to Canada to get it; and then all your function would have been to distribute your information through your journal?—If that were the only matter I should quite agree, but I contemplate that our representative abroad would get much more information than that; that he would get to know what was going on in the way of research, and that he would take advantage of the information supplied in the newspapers as to new ideas, new machinery, and anything of that kind.

Mr. T. H. Elliott.

30 Nov. 1894.

37,150. Still you are coming to information again which is not to be of immediate advantage to agriculturists for the purpose of an immediate crop or anything of that kind?—That is so. I am not entirely advocating the appointment of representatives abroad in regard to immediate information. There are matters not of pressing importance about which we could get information, but I believe we should get it better abroad than we could get it here east of Temple Bar.

37,151. Then you have never put yourself into communication, or contemplated putting yourself into communication, with people in the city who probably know about as much concerning the Argentine Republic and other countries abroad as anyone who will be found in the countries themselves?—I hardly know what is meant by putting ourselves in communication with people in the city.

37,152. I mean gentlemen in the city who are possessed of estates in every part of the world, and are full of information respecting the profit on those estates, and how the industries are managed, and who are generally well acquainted with the countries where their estates are situated; there is a large class of people of that kind?—If these gentlemen in the city will give us the information that we want for nothing, and do it well, of course *cadet quæstio*, there is no need for anything more. But these gentlemen in the city do not come to the Board of Agriculture and the Board of Agriculture does not seem to be able to put its hand upon them.

37,153. No, but I am suggesting to you that the Board of Agriculture might endeavour to put themselves in communication with them; they are bankers, financial agents, and rich gentlemen who have a little to do in the city, and who own estates all over the world. There are a large class of people full of information?—Of course I cannot speak of a class of men of whom I know nothing; but that does not seem to me at all the best way of obtaining the information we want. My view would be that it is much better to employ a man to obtain information in the country concerned.

37,154. Might it not help you if you were to get it at hand to check even the information that you get from your agents abroad?—One would not object to that if it is possible. There could be no objection to that.

37,155. Still you have not endeavoured to open up a communication of that kind?—We certainly did not look to the city as the probable source of continuous information on agricultural matters in foreign countries.

37,156. (*Mr. Little.*) Or of disinterested information?—Or of disinterested information. In a way we rather avoid the city, you may say.

37,157. (*Mr. Gilmour.*) I take it that your practical objection to follow the course that Mr. Giffen means, in plain English, is that these men in the city are naturally interested, perhaps, in one question more than in another?—That would be one of the objections and difficulties that I see.

37,158. And if you had in a country which is much mixed up with our own interests agriculturally a man whose services you could command, it would not be upon one subject or upon one point but it would be upon all that you could command those services?—That is so.

37,159. And he would be an all-round useful man to have at your command?—Yes; he would be a channel by which we could obtain information on all matters in that country bearing upon agricultural interests.

The witness withdrew.

(For Mr. Elliott's further evidence, *see* page 140.)

Adjourned till Thursday next at 12 o'clock.

Sixty-eighth Day.

Thursday, 6th December 1894.

PRESENT:

SIR ROBERT NIGEL FITZ-HARDINGE KINGSCOTE, K.C.B., IN THE CHAIR.

The Right Hon. BARON RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq. } *Assistant*
ALAN MACKINNON, Esq. } *Secretaries.*

Mr. D. Collins.

6 Dec. 1894.

Mr. DIGBY COLLINS called and examined.

37,160. (*Sir Nigel Kingscote.*) I believe you are a landowner in Cornwall?—Yes.

37,161. And have a considerable knowledge of the agricultural interests in that county?—Yes.

Effects of depression in Cornwall.

37,162. Will you kindly tell us what the effects of the depression upon the agricultural industry have been in Cornwall?—I do not consider that the agricultural industry in Cornwall has suffered to the same extent that it has in other counties, for the reason that there is great variety of cultivation, as there is also a great variety of soil and climate. Moreover, the farms are not as large in Cornwall as they are in some counties, and would range probably from 400 acres to 50 or 60. Until last year farmers, who were farming fairly well, maintained their position. Last year was the very dry year, and then all their grass crops failed, and the crops of spring corn were almost valueless. The consequence of that was that they had to make good the losses on their crops by the purchases of artificial feeding stuffs, and in most instances on those artificial feeding stuffs I should say more than their rents would be paid.

37,163. I conclude that all engaged in the agricultural industry, the tenants and everybody else, have felt the great fall in prices?—The fall in prices of course has rendered the cultivation of wheat for the purposes of sale in the market impossible, but there is a certain amount of it grown for purposes of thatching—and the grain is for the most part given to stock.

37,164. You have just said that last year especially they had to buy an immense quantity of artificial food. I suppose that food was purchased at a cheaper rate than it had been in former years?—At a lower rate than it ever had been purchased, and I may have occasion presently to mention that I am connected with a large co-operative association that I promoted some 15 years ago, and its transactions show how the depression operated.

Ownership of land in Cornwall.

37,165. Is the ownership of land in Cornwall generally absolute, or is it limited?—I should say that in the majority of cases it is absolute. There is a very strong feeling throughout the county that the owner for the time being ought in all cases to have powers of sale, whatever may be done in regard to the investments of the proceeds of the sale.

Subdivision of estates.

37,166. Within your knowledge has much land in Cornwall come into more hands of late years, or are the estates very much the same as they used to be?—The cases of one farm being thrown into two are exceptional. I know of some, but they are very few—only in the case where the farms were too large or the house and farm buildings inconveniently situated.

37,167. What I wanted to ask you was whether land has been sold to small owners, or whether the estates have kept very much the same?—They remain as far as I know absolutely the same.

37,168. Are there many small owners of land in Cornwall—actual owners, not tenants?—Yes, there are a considerable number, but the parcels of land would be small, very small, and only in favoured districts where the industry of fruit and vegetable culture is possible.

37,169. Is much agricultural land held on lease in Cornwall?—Do you mean on short leases between landlord and tenant?

Leases.

37,170. Between landlord and tenant?—Yes, nearly all of it is held on leases for 7 years or 14.

37,171. (*Mr. Little.*) There are a good many leaseholders, are there not?—Yes, there are.

37,172. (*Sir Nigel Kingscote.*) Is there not a considerable quantity of land in Cornwall let upon lifeholds?—Yes, considerable.

37,173. As they fall in have they been renewed, or are they coming more into yearly tenancies?—As far as I know they are all of them coming into yearly tenancies.

37,174. At the same time there are short leaseholds common in the county, that is, for 7 or 14 years?—Yes, 7 or 14 years; rarely ever 21 years. 21 years would be an exceptional case where common land would be brought into cultivation.

Changes in system of farming.

37,175. As regards the management of estates and the changes in the system of farming, are they much the same as they have been or are there changes there?—Landowners have had to expend a considerable sum in excess of their former practice in finding greater accommodation for their tenants who require to feed a greater number of stock than they used to do.

37,176. That is, they have had to erect more buildings?—Yes, and on those buildings, as far as I know, no interest has been paid. It is considered part of the business of a landlord to make that sacrifice, and thus take upon himself some share of the depression.

37,177. And there has been since the depression set in a larger demand for the buildings, on account of their keeping more stock and growing less corn, I think?—On almost every farm.

37,178. Do the tenants do the repairs generally, or the landlord?—The landlord does all the repairs and maintains the gates.

Land laid down to grass.

37,179. Has much land been laid down to grass?—Not laid down. It has been the practice in Cornwall for many years to get the ground as clean as possible for the grass seeds, and to let the land remain laid down as long as it will profitably do so; usually from four to five years.

37,180. According to the nature of the soil?—According to the nature of the soil and the state of fertility in which it is.

37,181. As the seeds have taken?—Yes.

Condition and wages of agricultural labourers.

37,182. Now with reference to the agricultural labourers, what is their condition as regards the past and present?—Their condition is better than it ever has been within my recollection. My recollection extends over 40 years, and I have never known them as well off as they are now. They are fairly well

Mr. D. Collins.
6 Dec. 1894.

housed; the cottages of course in some cases would admit of improvement, but on the whole I should say their condition is decidedly better than it was some years ago.

37,183. Have their wages risen within the last 10 or 12 years?—In East Cornwall they have remained the same, 15*s.* a week, and the rent of cottages would range from 9*d.* to 1*s.* 6*d.* a week.

37,184. Does that 15*s.* a week mean 15*s.* weekly, or is that taking into consideration what they may earn at harvest time?—A good labourer in Cornwall would earn, taking the year through, much nearer 1*l.* a week than 15*s.*

37,185. Would shepherds, and stockmen, and horsemen receive more?—There are no such persons in Cornwall, as a rule. The farmers attend to their stock themselves, and they do all the skilled work on the farm. They drive the mowers and reapers, and so on. All work requiring mechanical skill, or indeed considerable manual skill, such as building stacks is all done by the farmers themselves, except on the largest farms.

37,186. Therefore, generally speaking, they must be very hard-working men?—I should say, taking the county through, that one farmer would do quite as much work as two labourers.

37,187. You say that the labourers are fairly well housed, is there generally with their cottages a portion of land with a garden, or do they have allotments?—They do not have allotments. The practice is to give them about an eighth of an acre of land with their cottages, and in addition to that the farmers for whom they work set apart 20 yards of fresh land, on which of course potatoes grow better, which they manure for them, free of charge, the labourers only having to find the seed potatoes. Consequently there is no demand for allotment ground.

Migration and emigration of labourers.

37,188. Do the young men among the agricultural labourers leave the county much, or is there any difficulty in getting labour?—There is a difficulty. The sons of well-to-do labourers seek to improve their condition in life by going into the towns or, very frequently in Cornwall, going abroad. They think nothing of going to America. America is a sort of second home to them; many go in the spring and come back in the winter.

37,189. The young men do?—The young men do, and they live on what they have saved in America which is generally sufficient to enable them to tide over the winter.

37,190. They go merely for the harvest?—No, they go to do anything.

37,191. But come back?—They come back generally to spend the winter. They do not care about the climate in America, they may be in a part of America where there would be little or no work to do owing to the severity of the climate. Sometimes they work their way back.

37,192. Did many of the labourers emigrate to America or Canada in former days?—Yes, there was a continual stream of emigration. The way in which it affects the farm labourers is this: that some of them engage in the mining industry, and then they have relations in America, who tell them that there is certain employment to be obtained by a good agricultural labourer, and then they go out and either undertake the care of stock at the ranches, or they do any other work for which they are fit.

Wages of agricultural labourers and miners compared.

37,193. Are the wages earned by the agricultural labourer in Cornwall much less than the wages earned by the men who work in the mines or the quarries?—Unfortunately the wages earned in mines vary so much that it is impossible to say. Sometimes they earn a good deal, and sometimes nothing at all. It is very difficult to know what the standard of wages in mines is.

37,194. You cannot make any comparison between the two?—None whatever, only that the agricultural labourer is a great deal better off. He is comparatively a rich man.

37,195. A great deal better off?—Yes, he is comparatively in a state of affluence.

37,196. Better housed?—Much better housed. But then the reason of that is that a great many of the cottages in which miners live have been erected on life leases, and landlords have no power over their condition whatsoever. In nearly all cases of the housing of the agricultural labourer the landlord has a direct interest and he very seldom parts with the control over cottages—he very seldom lets them with a farm.

Mr. D. Collins.
6 Dec. 1894.

Life leaseholds.

37,197. I suppose a life leasehold, either for houses or for land, you would look upon as a very detrimental thing?—It is mischievous to the community as a whole and to the landlord in particular. To put a life leasehold property in order when it comes into your hands, according to my experience will range from 13 years purchase to 20.

Foreign competition.

37,198. Now we will please turn to the causes of the depression, what do you think has been the cause of the depreciation in the prices of agricultural produce?—Absolutely foreign competition. There is no doubt that articles of agricultural produce of inferior quality are almost unsaleable in the market in consequence of foreign competition.

37,199. Owing to climate, the foreign produce, speaking of corn, is superior to the quality that can be grown here?—Corn and cattle. We cannot compete with the foreigner in grain or cattle of inferior quality. In rough beasts they can beat us out of the markets; there is no doubt about that; and it is only by producing animals of the highest quality that we can hope to hold our own in that competition.

Quantity of cattle and corn produced in Cornwall.

37,200. Is Cornwall able to produce the best cattle?—That will depend upon the localities. Of course there are very highly favoured localities in which cattle and sheep of the best quality can be produced.

37,201. And as regards corn in Cornwall can you grow a good sample of wheat?—We can grow a good sample of wheat and oats, but not of barley. Owing to the humidity of the atmosphere the barley is apt to be stained, and therefore it will not make the highest price as malting barley.

Bad seasons.

37,202. Do you attribute much of the depression to the unfavourable seasons?—I attribute the whole of the depression and the loss of capital of last year to that.

37,203. In 1893?—Yes.

37,204. Would you mind going back a little further, say 1879; was there much loss then?—That was not so bad a year, in so far as the crops were concerned, but there were infinitely larger losses of sheep during that year. Some of our northern districts of Cornwall were completely denuded of sheep by the rainfall which brought about fluke and other mischiefs.

37,205. You have not suffered from that since?—No.

Cost of production.

37,206. As regards the cost of production, is the cost of production greater?—I am sorry to say that where you depend upon the quality of labour, it is. Labourers are not as good as they were. If you wanted to find one labourer better than another one you would have to look about for a man somewhere about 50 years of age.

37,207. Is that because the young men will not learn?—It is because they appear to have nothing like the aptitude of their parents for manual labour, and they have not a sufficient but an insufficient education. They seem to think that they are cleverer than their parents, and they are educated in matters, if educated at all, that will not help them to earn their living as agricultural labourers.

Labour displaced by machinery.

37,208. And yet the cost, you say, is as great, or greater?—The cost is greater, but then in Cornwall our farmers have adopted mechanical power and effected an immense saving in labour. They all of them buy an enormous quantity of machinery. If you go through the country you rarely see anyone binding the corn; it is done by the American reapers and binders.

Increase in county rate.

37,209. Have the rates and taxes been increased or not?—They have been increased, but we hardly know how we stand. Unfortunately, in spite of the State subventions, the amount being paid now to us in the county in respect of probate duty appears to be a decreasing quantity. We hardly know how we stand. It has increased our county rate considerably this year.

37,210. Is that universal over the county?—Yes, it applies to the county rate.

37,211. Is that for highways?—The maintenance of the main roads would come under that, and all charges in respect of the county institutions and county council expenses.

37,212. (*Mr. Lambert.*) Then the maintenance of the main roads would be transferred from the parishes or the localities to the county?—Yes, certainly.

Mr. D. Collins. 6 Dec. 1894.

37,213. There would be a relief in that respect?—Yes, there is a relief, only we do not get the capital sum that we did.

37,214. (*Mr. Dalton.*) Are you quite sure the county rate has increased in your county?—Yes, considerably.

37,215. According to the return which is just published for general county purposes, which is the rate out of which the expense of your main roads come, it was 3½*d.* the year after the passing of the Local Government Act, 2*d.* the next year, 1½*d.* the next, and a penny the following year, so it fell considerably down to 1893?—It is since then that the rise has taken place.

37,216. Could you say how much it is for 1894?—We have got an additional penny. I cannot exactly tell you what it is.

37,217. That would bring it back to the 2*d.*, which is 1½*d.* less than it was for the year following the passing of the Act?—It was a penny extra for the last half year.

37,218. Your subventions must have fallen off very little last year; that would bring about an increase of nothing like 2*d.*?—I cannot tell exactly how much, but it will be some thousands of pounds.

37,219. (*Sir Nigel Kingscote.*) As a matter of fact have the county rates increased in the last five years?—Undoubtedly.

37,220. (*Mr. Dalton.*) According to the return I have here they have fallen; this return comes from the county council; I am taking the general county purposes?—That is explained in this way, that it is on a different valuation. For all the purposes of the county rate there was a re-valuation some four years ago, I think it was.

37,221. In what year did you have the re-valuation; in this return they have got the same assessment for each of the four years?—I think it would be in 1890 or 1891.

37,222. This comes from the audited financial statements furnished by the county council?—I think the re-valuation took place in 1890 or 1891.

37,223. I do not know whether they made a mistake in it, but according to the returns it remains the same from 1890 to 1893?—I cannot quite understand this, because I was on the valuation committee myself, and I know the valuation was increased.

37,224. (*Mr. Little.*) Perhaps when you said the rates were increased you were speaking of a period further back?—I am going back to the general increase of rates in the last 10 or 15 years. I thought they had increased since then. This present half year, at our last meeting in November, there was a discussion about it, and then there was stated to be an increase of either a penny or 1½*d.*

37,225. (*Mr. Dalton.*) The return I have here only goes to 1893, so it does not take in the last half year?—I am perfectly satisfied with my evidence. I could substantiate it if I had the figures here.

37,226. (*Mr. Lambert.*) What would be the increase in the county rate since the County Council Act came into operation?—It is very difficult to say, because additional charges have been imposed upon the county. It is therefore very difficult for me to say how they would compare.

37,227. (*Sir Nigel Kingscote.*) You wish to state——?—That there has been an increase in the county rate on the whole.

37,228. Since when; since the last five years?—I should prefer saying—to be quite accurate—since the establishment of the county council.

37,229. Have you not benefitted in any other way, by the roads being better, for instance?—The cost of the maintenance of the roads has increased, owing to the difficulty of getting effective labour.

Taxes on real and personal property.

37,230. Have you anything else to say as regards the rates and taxes?—I have got simply to say that there is a very wide feeling in Cornwall, a very general feeling—that land is bearing an excessive proportion of the rates and taxes at present, and that some means ought to be devised whereby personalty should bear some portion of the local burdens—more than it does now, at any rate.

37,231. Do you consider that that is a very prevalent feeling among the agricultural community in Cornwall?—It is a general feeling; wherever you go you hear complaints with regard to that. It is thought that the agricultural industry is not protected in any way by tariffs, and ought to be placed in a position of equality, at any rate, once more.

Mr. D. Collins. 6 Dec. 1894.

Charges on land in Cornwall

37,232. Now we will take the next head in your proof which refers to the charges on land; are they heavy in Cornwall?—No. Of course in Cornwall we have the land tax, and so on, but I do not consider that our charges on land compare unfavourably with the charges elsewhere.

Security of tenure.

37,233. Have you anything to say as regards the present system of land tenure?—I should like to see greater security given to good tenants, if there were any possibility of doing so; but at present I can see no better method than that of the landlord and tenant securing their interests as far as they can, by covenants in leases adapted, of course, to the peculiar circumstances of the different localities. If we are to lay down a rule by which good farmers would be compensated, in one part of Cornwall it might work well, but in another it would not work at all well. It would not apply to the fruit-growing districts for instance, where special arrangements must be made, nor would it apply to certain small holdings.

Agricultural Holdings Act.

37,234. Has the Agricultural Holdings Act been put into operation in Cornwall?—That has been, as far as I know, practically inoperative.

37,235. For what reason?—I think the impression is, that the occupier, when claiming compensation would probably find that the landlord's claim would be equal to, if not greater than, his own. Cornwall is a county in which artificial manures are used very largely, but the operation of those artificial manures is limited to time—and a very short time—and would not probably extend over the 12 months, except in the case of bones on grass land and lime on all land. With the exception of those two manures, you would scarcely see the effect of artificial manures in the second year.

37,236. Is there a custom of the county in Cornwall?—No, there is none; but I think the Agricultural Holdings Act has been productive of this good, that it has afforded a basis for the settlement of claims between landlords and tenants, and that they have acted in the settlement of those claims on the principles laid down in the Act.

37,237. That is by arbritrators?—Yes.

37,238. (*Mr. Chaplin.*) Then indirectly it has had a considerable effect?—Yes, a very good effect.

Land Courts.

37,239. (*Sir Nigel Kingscote.*) Have you heard any wish expressed in Cornwall that there should be a land court to decide between landlord and tenant, or is the present system generally accepted?—I think people who have no definite views in regard to what they would do, are disposed to advocate a land court. They do not know, I think, what the land court would have to do, and when asked they have never been able to define what it would have to do; but they think there ought to be some machinery which they have not got at the present moment for settling certain disputes as they arise.

Restrictions on cultivation.

37,240. In the leases or in the agreements between landlord and tenant in Cornwall, are there many restrictions as to the method of cultivation?—There are restrictions in regard to the proportion of grain, as a rule, and the sale of hay and straw, but those restrictions are intended to be applicable only during the last year or two of the tenancy, for the protection of the incoming tenant. As a rule the occupier writes a letter or applies verbally for leave to sell hay and straw, and until the last year he would be allowed to sell it in any quantities.

37,241. Then in reality except for the last year or two there are no restrictions?—None whatever, practically—absolutely none. Most farmers sell hay and straw, there is no doubt about that.

Sale of adulterated products.

37,242. As regards the sale of adulterated products, is there any strong feeling as to that among the tenants?—Yes, there is a very strong feeling. I am afraid that the Adulterated Foods Act is more a dead letter than it ought to be, and that where possible all products ought to be marked, or to be capable of identification in some way or other. Of course in the case of meat there are many difficulties in the way, and I have no particular remedy to suggest.

37,243. Is this only to apply to foreign products?—No. In Cornwall they feel very much, whether rightly or wrongly, that some ingredients are used in the

Mr. D. Collins.
6 Dec. 1894.

manufacture of beer, other than barley, which practice operates prejudicially to the interests of the growers of barley. They think that the barrels containing the beer ought to bear some distinguishing mark.

37,244. So that if there is anything else but barley and hops in the beer, it should be so stated?—Yes.

37,245. I suppose the same should apply to dairy products?—Yes, they feel very strongly about that; but I think that margarine now is not sold as butter to the extent it used to be.

Railway rates.

37,246. Is there any strong feeling as regards railway rates?—There is a very strong feeling indeed. The railway rates in Cornwall are perhaps higher than they are in any other part of England. It is generally felt that the rates ought to be revised more with regard to the value of the products conveyed, and it is considered that although there were tables put forward during the last revision by the railway companies, yet somehow or other the revised rates have not operated to the farmers' advantage, as had been hoped.

37,247. Is that due to the want of competition in Cornwall as regards railways?—It is due entirely to the want of competition; in fact this is so severely felt in some parts of Cornwall, that lines of steamers have been run for the purpose of conveying cauliflowers, and other products from the small holdings in West Cornwall.

37,248. Has there been any consideration of the question of light railways in Cornwall?—There has not been any mention as far as I know. It is a very bad district you see for that purpose; it is so hilly.

37,249. I suppose taking Cornwall generally it is very difficult to get your products to the railways and to the markets?—It is very difficult. Of course we are helped to a certain extent with regard to heavy goods by the seaboard, Cornwall being narrow.

Allotments and small holdings.

37,250. Has the Small Holdings Act or Allotments Act been in force in any part of Cornwall?—No, except in the neighbourhood of populous places; the Allotments Act has, I think, been quite inoperative; and the Small Holdings Act appears to me to have little or no effect, and to have been promoted rather for political ends than industrial.

37,251. Have you had any experience of small holdings yourself, that is holdings of 40 and 50 acres, and of watching their operation?—Yes, I have some of my own. I think it would be a great boon if we could have small holdings; I think they afford the agricultural labourer the only means of rising in the world. I think there ought to be land held in plots of all sizes.

37,252. Would you be for advancing to the agricultural labourer certain money in order that he might obtain a small holding?—I am not a financier, but I should think it would be a very dangerous experiment.

37,253. A good many of the small holdings in Cornwall are, I suppose, almost necessarily market gardens?—Some, but not all. Some of the labourers who get a small plot of land find themselves obliged to give up their positions as regular agricultural labourers and become casual labourers, or as they call them in Cornwall "slingers," who work where they can. Some of those men get on extremely well. I do not know whether I ought to give an instance of my own with regard to allotments.

37,254. Certainly?—Twenty-two years ago I enclosed 52 acres of exceedingly good common land; I erected the fences, and I let the land in parcels of from one to four acres to agricultural labourers, the first three years for no rent at all, the second three years for 2*s.* 6*d.* an acre, and afterwards for 10*s.* an acre, so that practically the rent was unimportant. I need hardly say that no labourer paid the rent of 10*s.*, for they all gave up their allotments after seven years; seven years was the longest tenure. Now that land is held by a manufacturing blacksmith, a manufacturing bootmaker (I mean a man who manufactures for bootmakers), a master carpenter, and a tenant farmer; no labourer has any of it.

37,255. Would you say that the men who take these small plots must have some other trade to help them?—The labourers found out that it would not pay. In fact, the best labourer of all said that he kept a strict account, and he found that he could not possibly earn half-a-crown a day on his allotment, and he thought he had better work where he could get more money than he could get there.

37,256. Is the Ground Game Act put into operation in Cornwall to any extent?—Yes, but as far as I know its provisions are not observed; they may be by one or two landlords. I do not know anything about that, but I do not know any landlord who enforces its observance. Tenants are allowed to trap pretty nearly as they like and where they like. There may be exceptions to that, as I say, but I do not know of them. As to trapping under ground, they do not do anything of that sort, but they have their traps in fields and in the fences. I consider that the operation of the Act has been disastrous to farmers; it has led to a great increase in the number of rabbits and a great diminution in the number of hares, and it has turned a great many of the sons of farmers into third-rate gamekeepers, who—some of them—naturally do not succeed very well as farmers afterwards.

Mr. D. Collins.
6 Dec. 1894.
Ground Game Act.

37,257. In reality there are more rabbits?—A great many more; I have more trouble about them than anything. Of course I give my tenants the rabbits, but I have threatened to employ trappers if they do not reduce the number; the rabbits damage the fences seriously.

37,258. Is that because the tenants can make more money by the rabbits than they can by farming?—It is that they have not the time to spend on the catching of the rabbits.

Loans for improvements.

37,259. Would you wish to say anything as to any measures which in your opinion would aid agriculturists: you have said something, for instance, about loans for small holdings?—I confess I am not a very ardent advocate of State loans for that purpose; I cannot see my way to advocating it.

37,260. Would you advocate that landlords should be able to borrow money for improvements?—Not to a greater extent than they are able to do now.

37,261. They can only do it now through the Lands Improvement Acts, I think?—Yes.

37,262. Do you think that is sufficient?—I am afraid that a great many so-called improvements would not be profitable, and consequently the land would be burdened a great deal more if these were not profitable than it is burdened now. I think the effect would be to increase the charges on land as surely by that method as by any other.

Burdens on land.

37,263. Have you anything to say as regards the reduction of the burdens on land?—Of course, we feel that our burdens are very heavy as compared with the burdens which we believe weigh upon foreigners; and we imagine that they affect us very prejudicially in competition with foreigners. I cannot suggest any remedy other than that which I have suggested before—that I think realty ought to bear some of the burden which land now bears.

37,264. I think you believe that the taxation on land ought to be reduced?—I think it would be just to take the returns to the property tax commissioners, and to levy the local rates on them.

Agricultural education.

37,265. Have you anything to say to us upon the subject of agricultural education?—I think that the best results which have been achieved by agricultural education so far have been by manual instruction. It appeared that the South Kensington authorities did not like our proposal to give prizes to working men, and so we do not actually give prizes to them; but we call them demonstrators, and we set them to work and give them so much for their demonstrations so that they can show the lads how work can be done in the most skilful way.

37,266. What sort of work is that?—All farm work; hedging, thatching, ploughing, and spear making—in fact, every kind of work that a labourer can be called upon to do. The result of that has been that within two years we have had lads of 14 to 15 years of age, who have really made a very good and sound piece of hedging indeed in the prescribed time, which would be four hours. They have to make six feet in that time—six feet of face.

37,267. Would you like to see this method extended?—I think it would be most valuable. We find with regard to the scientific instruction given that the sons of the agricultural labourers, and the agricultural labourers themselves, very soon get tired of it. They say they do not see what good it can do them, and the lectures are attended more irregularly as time goes on.

37,268. Is there a decreased attendance at the lectures?—There is a steady decrease.

Mr. D. Collins.

6 Dec. 1894.

Agricultural Co-operative Association

37,269. But in the actual practical working is there an increase?—Yes, I should say so decidedly.

37,270. You wished to say something just now about co-operation?—I was saying that we found it so difficult for our farmers to obtain fertilizers on favourable terms, that some two or three farmers and myself combined to start an Agricultural Co-operative Association in Plymouth. It was established at an unfavourable time —1879, coming immediately after we established ourselves, and many of the landlords held aloof from the movement, because they were afraid that the farmers in a time of depression could not possibly pay ready money for what they found it necessary to purchase. However, we have carried on the business from that time until now, with the result that we sold 19,000*l.* worth of fertilizers and manures in the first year, and this year we have turned over 265,000*l.* worth at a cost of only 14,000*l.* in respect of working expenses. The consequence is that all our shareholders and members have an absolute guarantee of the quality of seeds, and of all manures that they purchase from us. We have now extended our society to Bristol, where I think last year we did a business of some 75,000*l.*

37,271. Every person employing the Society must be a member of it, I presume?—He must be a member and a shareholder; but we do not necessarily allow any person to be either one or the other. We discovered abuses. Certain persons wished to make use of our capital, and also the knowledge and enterprise of our managing director, for the purpose of carrying on a retail trade; and they purchased goods for re-sale. We strike their names off and make them forfeit their shares if we detect instances of re-sale. It is a self-supply association, and only 5 per cent. is paid upon the shareholders' capital; and whatever surplus there may be after that is divided by way of bonus to the purchasers, so that if they give rather too much for anything they buy, they know perfectly well that they will have it returned to them at the end of the year.

37,272. Is the business of the society confined to manures and feeding stuffs?—No. We have sold I should think nearly 200 American reapers and binders during the last few years.

37,273. And seeds?—And seeds.

Co-operation in sale of produce.

37,274. Do you sell any produce by co-operation?—No, I do not approve of that. That cannot be effected in my opinion. You may purchase, but you cannot sell.

37,275. You let everybody go to their own market?—You see the question of quality comes in. The members and shareholders of the Sale Association would naturally apply to you to sell articles of produce of inferior quality, whether cattle, grain, hay, or anything else, and you would be obliged to represent to them that you could not sell such produce. Their answer would be, "We can sell the rest in the open market as "well as you can sell it for us, and if you cannot sell "for us what we want particularly to sell, and what "we cannot sell elsewhere, we shall withdraw." That is practically what has been done in a Sale Association that was started by myself. I foresaw its failure; but I assisted in starting one at Falmouth for the Falmouth, Truro, and Helston district. But it very soon came to nothing. I do not see any possibility of the sale of produce by co-operation.

Co-operative dairies.

37,276. Has anything been done in Cornwall in the way of dairy co-operation; that is, in the way of milk factories and butter factories?—The number of cows kept within a given area would not be sufficient to render that a profitable way of conducting this business. You would require about 600 cows in flush milk, within an area of about four miles, and we should not have that number, or anything like it. As a rule, a farmer would keep from 10 to 12 cows, and market their produce himself to better advantage.

Fruit-growing in Cornwall.

37,277. (*Lord Rendel.*) Does Cornwall benefit, do you think, by its earlier and more advanced climate?—Undoubtedly. The strawberry-growing industry and the fruit industry would be impossible with us if it were not earlier than Kent and the Southampton district. We ought to be in the market 10 days before them to render the growth of fruit profitable.

37,278. Do you think it realises that benefit as much now as it has done previously?—It has done the last three years. We have been 10 days before them. To show you how necessary that would be, two years ago dessert fruit, the best strawberries that we pick, were being sold, after the first fortnight's picking, at 1*d.* a pound in Plymouth in any quantity. Of course they would not pay for the picking.

Mr. D. Collins.

6 Dec. 1894.

Strawberry and raspberry growing.

37,279. That advantage to a considerable extent modifies the results of the whole of the agricultural industry in the county, I suppose?—No; the fact of the matter is that strawberry-growing is only possible in certain districts. Curiously enough, strawberries can only be grown for any length of time on old coppice land. We know from experience that it is the leaf mould which enables us on that land to grow strawberries continuously for some 15, 16, or 20 years. I do not consider that the general character of the land in Cornwall is at all suited for the growth of strawberries. A great many raspberries are grown, and the climate suits them. The culture of raspberries is not nearly so costly, because the raspberries can be grown under trees in shaded places, and whether the cultivation is particularly clean or not does not matter so much. They are packed in barrels and sent away at a very small expenditure of labour and money.

37,280. Is it, generally speaking, a country of small holdings?—Yes, I should say it was as compared with some counties. I think about the largest farm in the county probably would not exceed 600 acres, and the average would be from 150 to 200.

Labour displaced by machinery.

37,281. The proportion of the wage-paid labour is relatively smaller, I think?—It is very small indeed, and getting smaller every year, and must do so as manual labour is further displaced by mechanical power.

37,282. Is machine labour steadily displacing hand power?—Yes, in the houses, the homesteads, and on the land.

37,283. With a corresponding rise in the wages of hand labour?—With a corresponding difficulty to get good labourers; not altogether with a corresponding rise in the wages. There is great difficulty in getting good labourers in consequence.

Condition of agricultural labourers.

37,284. Yet you put it very strongly that in your opinion the labourer is doubly as well off as the small farmer?—The labourer is at the present moment far better off than the farmer with 50 or 60 acres.

37,285. And he is better off than the mining labourer, I think you said?—Very much. I think many of those poor fellows are in distress.

37,286. Are the miners generally on weekly wages?—They are paid by the month. They used to be paid by the five weeks' month, but now they are paid by the four weeks' month. They are, many of them, only earning 2*l.* a month, and they are not regularly employed then.

Agricultural education.

37,287. With reference to improved agricultural education, as I understand you are favourable to the more practical side of it?—Entirely. I think that is the only education likely to be productive of good. I am strongly of opinion that no one can teach farming; a man may learn it, but no one can teach it. Therefore I think scientific education ought to come after practical knowledge, and not before.

37,288. I understood you to think that there was some leeway to make up as between the quality of agricultural labour at present and the quality some 30 years ago?—Yes, there is a great deal of leeway, and I think we should make it up if we were to be allowed to carry on the demonstrations. Of course it is not very pleasant to be obliged to expend money in a not very direct way, but still I do not see that there is any serious objection to it.

Life leaseholds.

37,289. You spoke of life leaseholds. Did you refer to leases by occupiers for the life of the occupier?—No, the leases are for three separate lives generally, and not for the life of the occupier; sometimes the life of the occupier is included, but on my estate it was scarcely ever so.

37,290. Then it is a system of leases simply for a life or lives?—Three lives generally, but landlords have seen the evil of renewing life leaseholds, and they refuse to do so for the most part.

37,291. It is on the side of the landlord that the lapse takes place?—Yes. You see complaints have been made of the insanitary condition of such tenements. The leaseholders state that it would not pay them to make any improvements, and the landlords are powerless to enter to effect them.

Wages of miners and agricultural labourers compared.

37,292. (*Mr. Elton.*) I suppose a good many of the miners are paid, not by wages, but by taking adventure work in the concern?—There is a great deal of

adventure work in the mines of Cornwall; and the people prefer that method infinitely.

37,293. Therefore perhaps it may compensate to some extent for the smallness of the fixed wage if many of the people prefer a speculation to working on tribute?—They all prefer that.

37,294. What you said then about the miners generally having small wages must be taken with the additional remark that the best of the miners do not work on the wages system at all?—I am sorry to say that my remark is capable of universal application during the last year or 18 months. I know this by the state of distress they are in, and the applications which have been made to me for employment, and the difficulty there is in employing them, because they are absolutely unfit for the work of agricultural labourers since they know nothing about it.

Life leaseholds.

37,295. Some of the cottages in which the miners lived are lifeholds, are they not?—Yes, a great many of them.

37,296. Who grants the lifeholds?—They were granted when landlords were under the impression that certain mines would be worked for a certain number of years, and then cease to be; in short, that the industry in the district would be ephemeral. They were practically right when they refused to erect cottages for an ephemeral industry which they thought would disappear within a few years.

37,297. Who erected the lifehold cottages; that is what I cannot quite make out?—The miners themselves erected them in many instances—in most I should say, and in some cases perhaps a tradesman, such as a general dealer or a grocer who had saved some money.

37,298. Who granted the life-holds?—The owners, of course.

37,299. The owner grants the life-holds; of course no one else could?—Yes. The owner granted them on the ground that it would not be worth his while to erect cottages which would be vacated the moment the mine ceased to be worked. Now, I believe, in the parish of Redruth, which was the great mining parish of Cornwall, there is not one single mine working.

37,300. You mean that the only terms on which he would raise the cottages was making a kind of permanency of it, and giving it for lives if they liked, but not for less?—He said simply this: If it is worth your while to erect them, do so. I will give you every facility, but I myself shall not do it.

37,301. That makes it quite clear as to the lifehold system. Of course it was common all over the West of England; it being a West of England tenure?—It was universal in Cornwall.

Tenancy in common.

37,302. Was there not in Cornwall a good deal of tenancy in common, or is there not still a good deal of tenancy in common?—No, not very much. I fancy that that is a misconception. There is very little; there is some, of course.

37,303. It has been frequently stated?—It has, and settlements have been arrived at in those cases.

37,304. I am speaking of some few years ago?—Of course there are certain rights of turbary.

37,305. I do not mean that at all, and I did not say it either; what I said was tenancy in common. Is there not a large amount of property held in fractions, of which one man may hold seven-sixteenths and another nine-sixteenths?—Yes, but generally it is held in moities.

37,306. That rather distinguishes the tenure from other counties?—Yes, but it is almost entirely held in moities.

37,307. There is a great deal of that, is there not?—Yes, but the moities have been purchased by one side or the other in nearly all cases.

37,308. You do not know of their going down to very small fractions?—I never heard of one; I never had one myself, although I have had a great many moities.

37,309. That would be more in town property, I suppose?—Yes.

Early vegetable growing.

37,310. You spoke about fruit farming a good deal; does what you said, *mutatis mutandis*, apply to the early vegetable cauliflower, and to the early young potatoes?—No, the early vegetable is grown in a very limited area indeed, and it appears to be due more to the character of the climate than to the soil.

37,311. Might that not be rather more viewed as a Scilly Island industry?—It begins at St. Ives, and goes to the Scilly Isles. In the centre and east of Cornwall the soil is not at all suited for the growth of vegetables.

Mr. D. Collins. 6 Dec. 1894.

37,312. West of St. Ives it is almost surrounded by sea and like an island?—Quite so.

Cornish barley.

37,313. You said that the Cornish people had strong views on the question of barley, and of beer made of barley being good for them, that is, of beer being made of the good old materials; but I also understood that they did not grow barley which was fit for beer making?—They do not grow the best barley; they can grow malting barley, but they could not compete with the district of Bury St. Edmunds.

37,314. I know their stained barley well enough. Therefore their opinion is perhaps rather academic, as they do not come into the competition themselves?—It may happen to be.

37,315. They do not sell much malting barley?—Yes, they do, but to what extent it is used I am naturally uninformed; it is a matter of speculation.

37,316. I only ask because I live in a part of the country where we cannot get any but rather stained barley, and we do not succeed in making much sale of it?—It is only sold locally.

Use of artificial manures in Cornwall.

37,317. (*Mr. Everett.*) In regard to the fertilisers, for what crops do the Cornish farmers buy them chiefly?—It is deemed bad farming in Cornwall to put farmyard or stable manure on ploughed land, because of the enormous rainfall washing it through to the rock. The consequence is that farmers who are able to hold their own chiefly use farmyard manure for their seeds or their grass lands, the roots of course preventing the wash to the rock being too rapid.

37,318. I suppose the fertilisers are put on for the corn crops—the arable crops?—They put them on for all crops. Taking the Cornish farmers as a body, they will spend on artificial manures very nearly their rent every year.

37,319. Do they think they see their money back again?—The men who do it have the best coats on their backs; I know that. They are the only men who are doing well.

Position of agriculture in America.

37,320. In regard to our comparative position relatively to the foreigners, you spoke of their having a preferential position as regards us; do you happen to know whether foreign farmers are flourishing at the present time, or whether they are as hard put to it as the English farmers are?—I am informed, but my information only comes from an individual, a Cornish farmer, who wrote to me from America not long ago that the state of things there is considerably worse than it is here. Of course he had knowledge of the state of things in America, but not of the state of things here. He said nothing could be worse; in fact he said that wheat was being sent down to certain stations, that no sales could be effected, that they could not have it back again, and that whether it would make anything or nothing it must be sold.

37,321. They are like us, they have to take what they can get?—Yes, the sale bears no relation whatever to the cost of production.

37,322. And they like these low prices as little as we, as far as you hear?—Yes.

37,323. Are there many labourers in your county who have paid yearly visits to America?—Not regular labourers, but casual labourers.

37,324. (*Mr. Elton.*) When you spoke of America just now, you did not mention the part?—Generally Colorado or California, because of the fruit growing districts of California. The fruit growers understand the business and they go there with special knowledge.

37,325. (*Mr. Everett.*) Then they are not ordinary agricultural labourers off corn farms?—They are not; they are off corn farms, but they come from a fruit district, and they have special knowledge.

Decline of population in Cornwall.

37,326. On the whole, the population of Cornwall, I think, has declined for 20 years or more?—It is declining more rapidly now than it was during the last decade, owing to the mines being abandoned.

Condition of labourers.

37,327. You spoke of labourers rising to the position of farmers; but I think we rather gather from your evidence that that is a very questionable rise, and the probability is that the labourer is better off than the

Mr. D. Collins. 6 Dec. 1894.

farmer?—Yes, but then it is his only means of investing his money: if he lends his money to his friends he generally loses it.

37,328. (*Captain Owen Thomas.*) I understand that you are a landowner in Cornwall?—Yes.

Acreage of estate.

37,329. What is the acreage of your estate?—About 5,000 acres.

37,330. Have you any land in hand?—I have only land that I took in hand owing to the dwelling-house being burnt down. There is no difficulty in letting any quantity of land in Cornwall; you have 40 or 50 applicants for a farm in fair condition.

37,331. Is the land chiefly arable, or pasture, or mixed?—Mixed, always.

37,332. Has much land been laid down to pasture lately?—No, they prefer the system of allowing the ley ground to remain down for four or five years.

Reduction of rent.

37,333. Have you made any reductions of rent?—I have made reductions, but I have never been asked for any.

37,334. What is the average rent on your estate?—It varies from 15*s.* to 22*s.* or 25*s.*; that is of course leaving out the grass plots near towns which are accommodation lands.

37,335. Are the tenants satisfied with what you have done?—Yes, they are thoroughly satisfied in every way. I should say that taking the letting value of the farms throughout Cornwall there has been a reduction of from 10 to 20 per cent.

Effect of season of 1893.

37,336. Have the farmers been able to make their rents now on their holdings?—They have up to last year. The method I have gone upon is to make them the same reduction as I find the farm I have in hand justifies. This last year was the worst I have ever had.

37,337. (*Mr. Lambert.*) You said there are a certain amount of good farmers in Cornwall who are doing well?—They were doing well up to last year.

37,338. Has anything occurred since last year to materially depreciate their position?—The large expenditure in the purchase of artificial food, consequent on the absolute failure almost of their hay crop, and their spring corn crop.

37,339. That would be a temporary depreciation owing to the season, and not, I presume, a permanent one?—We hope so, only, of course, it has entailed a considerable loss of capital.

37,340. But it is a seasonal and not a permanent cause?—Entirely.

Letting of farms in Cornwall.

37,341. There is no difficulty in letting farms in Cornwall?—None whatever.

37,342. How many applicants would you get for a farm?—If a landlord had a fair reputation—an ordinary landlord—I should say he would get perhaps for a desirable farm 20 or 30 applicants.

37,343. How are the farms usually let?—During the last two or three years, in consequence of the serious losses resulting from the season of which I have spoken, I think that perhaps prudent tenants would prefer a yearly tenancy, until they saw their way to take a lease, but that is only a temporary feeling.

Security of tenure.

37,344. Then they usually prefer to have security of tenure?—Yes, they do certainly, say for 7 or 10 years, not because of any want of confidence in their landlord, but because they know that human life is uncertain, and they do not know who might succeed their landlord.

37,345. That would show that it would be beneficial to agriculture, that a tenant should be fairly secure with regard to the capital he invested in his holding?—Yes, that is so.

Fixing of rents.

37,346. How would the rents be fixed as regards these 20 or 30 applicants?—Unless it was a case of a son or a nephew, or some person having a distinct claim to the occupation of the land, the farm probably would be advertised to be let by tender, and the best man would be selected if he offered anything at all reasonable.

37,347. I presume the letting by tender would practically put the farmers bidding one against the other for the farm?—Yes, certainly.

37,348. Would not rents tend, by such a method of letting, to be rather higher than would be justified?—Not where the landlord or the agent understood his business.

37,349. But where the landlord and his agent do not understand the business?—Then undoubtedly it would There are such cases, but I am glad to say they are very rare.

Mr. D. Collins. 6 Dec. 1894.

Depreciation in prices and fall in rents compared.

37,350. How much do you consider that the agricultural produce, which you usually produce in Cornwall has depreciated?—I should say that it would have depreciated about 20 per cent.

37,351. Has the reduction of the labour bill depreciated 20 per cent. as well?—No, it has not; that has remained stationary.

37,352. Then how is it that rents have only depreciated from 10 to 20 per cent., if growing produce has depreciated 20 per cent., and labour has not depreciated at all?—Because the farms were for the most part underlet.

37,353. They had not been paying enough prior to what time?—Prior to about 1879; I will not say enough, but there was a larger margin of profit than is commonly the case in the letting of land, owing to the properties in Cornwall being large, and the landlords taking a personal interest in their tenants.

Profits of tenant farmers.

37,354. What would you consider the margin of profit that a tenant should have upon his capital, after having paid his rent?—I think that a man is scarcely justified in working, even at the present value of money, for much under from 5 to 8 per cent.

37,355. How many tenants in Cornwall do you think are getting from 5 to 8 per cent. after paying their rents?—I should say this year none of them.

37,356. You must not take one year; take the average, say, of five years?—I hope there are a great many; I hope the majority are.

37,357. Would you be able to say that from experience?—Yes. I certainly should not keep a man on my estate who is not doing it in ordinary seasons, because a landlord's rent depends upon the profits of his tenants, and on nothing else.

37,358. That is quite true; but you think that for the past five years, excluding last year, the farmers in Cornwall have made, exclusive of the rent, a clear profit of 5 to 8 per cent. upon their capital?—I should say the majority of them do. It is very difficult to know what they are making as a whole, because farmers differ in capacity, as other men of business do.

37,359. Quite true; but I am speaking of the average?—The average undoubtedly have done so; if they were not doing that, they could not possibly take farms for their sons, as they do, and furnish them with ample capital. Many men have gone out of our county during the last few years into Essex, Gloucestershire, and other places, and I am glad to say that they are doing well.

37,360. That would rather point to the fact that there is very little agricultural depression in Cornwall?—There was not much up to last year.

37,361. So, if last year was only a temporary aberration of the season, and we expect to get fairly prosperous seasons in the future, there will not be much to complain of in Cornwall?—No, certainly not—if we retain the class of farmer we have got.

Effect of fall in prices.

37,362. (*Mr. Dalton.*) Then the fall in prices has not caused much depression in Cornwall?—It has caused a certain amount of depression of course, and farmers have curtailed their personal expenses very considerably.

Fall in rents.

37,363. You say the fall in rental is between 10 to 20 per cent., from what period do you take the fall; do you take it from the maximum?—I should say during the last ten years.

37,364. Does your memory take you further back; can you say, if you went 20 years back, whether there has been any fall at all?—I should say that for about 20 years ago there would have been a continuous fall in the value of land of about one per cent. You must understand what I mean by the 20 years, I do not mean since 1874.

37,365. But that is what I mean, between 1874 and the present time?—1874 you know was a time of great prosperity, 1878 was a bad year with us, and from that, from 1878 to 1894, I should say there has been a fall of about one per cent. per annum.

37,366. Of what parts of Cornwall are you speaking?—I am speaking of the part in which I live, in the east, and the part in which I farm, in the west. My property is scattered over 13 parishes.

Mr. D. Collins.

6 Dec. 1894.

37,367. Can you say what unions your property is in?—The Truro Union, the Liskeard Union, and the St. Germans Union.

Poor Law valuation in Cornwall.

37,368. We have just received a return at the Local Government Board from the Truro Union in which the present poor law valuation of agricultural lands and tithes, is given as 80,000*l.*; the corresponding return in 1871 being 70,000*l.*, is that owing to the valuation?—It is due entirely to the re-valuation.

37,369. What is the different system of valuation which has been adopted?—I am sorry to say there is no uniformity; in some valuations there is an abatement made of 25 per cent., in others of 15 per cent., in others of 10 per cent., and in others of nothing, or practically nothing.

Assessments to local rates.

37,370. When the rent is reduced, is the assessment reduced or does it remain the same?—Certainly not.

37,371. You do not reduce the assessment?—Undoubtedly not.

37,372. What is the reason for that?—It is due to the liberality of the landlord, and has nothing to do with the value of the land. You would be making people with bad landlords pay for people who had good ones.

37,373. They do not take rent at all as the basis of assessment?—They do take it, but they consider the actual value.

37,374. I rather gather from what you said that this reduction of 10 or 20 per cent., has not been made merely by particular landlords, but has been tolerably general?—It would effect the assessment in no way whatever, where it is an annual abatement, unless it is a permanent abatement the Assessment Committee would take no cognisance of it whatever.

37,375. But where it has been a permanent abatement?—Then they have in all cases.

37,376. Have most of those reductions been permanent abatements or temporary?—Temporary.

37,377. Then there has been little permanent abatement at all?—Except in the re-letting of farms.

37,378. (*Mr. Lambert.*) Only on the re-letting of farms has there been a permanent abatement?—Not only on the re-letting, but chiefly so, because landlords do not know what precise abatement they ought to make, nor do the tenants know what precise abatement they ought to ask for if the arrangement should be permanent.

37,379. That would, of course, point to the fact that sitting tenants have been rather overlooked if the abatement only takes place when a change of tenancy takes place?—Then you make a permanent arrangement, and they would not get an abatement, whilst all the other tenants at the rent audit would. If a fresh arrangement is made no abatement would be made at the rent audit; they would simply pay the rent they agree to pay in full, and the other tenants would have the reduction of 20 per cent., or whatever it might be.

Unemployed agricultural labourers.

37,380. (*Mr. Dalton.*) Have you many agricultural labourers unemployed?—No; not men worth employing.

37,381. Any bad ones?—Yes.

37,382. Large numbers?—I should say not; they are men who are of no use to anybody at all. It is most difficult to get an agricultural labourer in Cornwall.

County rate.

37,383. I think it is possible that some figures I gave about your county rate for general county purposes may have been misunderstood, and I want to prevent the possibility of my misleading the Commission in the matter. The figures I gave were for general county purposes. I find that there has been a rise in the rates for special county purposes, that is, in all of them, police and so forth. I took the general county purposes, because you were speaking of main roads, and the expensive main roads come out of the general county purposes rate. Taking the two together, according to our returns, the county rate has stood practically stationary, is that not the case?—Yes, until lately.

37,384. Until, would you say, this last year?—Yes.

37,385. Then I think you attribute the rise in that year to the diminution in amount of the general subventions?—It was under that impression that we issued the precepts at the last county council meeting.

37,386. I think there is a little misunderstanding about that. I have sent to the Local Government Board for the figures for every year since the passing of the Local Government Act, and the amounts that have been paid out of local taxation account to the county council. For the first year the amount was 44,593*l.*; for the next year it was 52,638*l.*; for the next year, which was the highest of the lot, and which has, perhaps, led to the misapprehension, it was 56,331*l.*: for the next year it was 54,104*l.*; and last year it was 54,684*l.* In the exceptional year, when you received 56,331*l.*, the probate duty, as I dare say you will remember, was exceptionally high?—Yes, it was.

Mr. D. Collins.

6 Dec. 1894.

37,387. That was a decidedly exceptional year. Leaving that out of account, the sums you have received in the last two years have been higher than those you have received in any other years during the period, and last year it was higher than the one before?—I believe your figures are correct.

37,388. The amounts you have received during the last two years would not lead to any increase in the county rate?—I went simply on the impression that we had at the finance committee meeting, that our receipts would be considerably less this year; in fact, the letter from the Local Government Board proved that, and on that we, of course, drafted our precepts.

37,389. I do not think we have said they would be considerably less this year. Up to the present time they have been substantiallythe same. Of course we cannot say what the estate duty will produce; but up to the present moment we have received practically the same amounts as we have in previous years. The probate duty has always been a very varying duty. It depends upon the number of large estates that pay probate duty during the year. Has there been any rise in any other rate? The poor rate has gone down in most of the unions in Cornwall, has it not?—The poor rates have not risen to my knowledge.

37,390. Then your other main rate would be the highway rate: has that gone up?—The highway rate has gone up chiefly owing to the circumstance I have stated, that the labourers are not so good, they are not as efficient.

37,391. Can you say to what extent it has gone up?—I am the chairman of the highway board of one district, and there we have been able to keep it down to a considerable extent; but I believe it is supposed throughout the county to have increased something like 20 per cent.

37,392. Can you say what is the average rural rate which is being paid on your estate?—It varies considerably; in some cases it is as high as 6*s.* in the pound.

37,393. In what union would that be?—I think that is in the Liskeard Union.

37,394. Six shillings in the pound?—I am not sure about that amount, but that is my impression.

37,395. Is that near a town?—Yes.

37,396. You are paying an urban rate there I suppose?—Yes, it would be no doubt an urban rate. The average would be somewhere about 4*s.*

37,397. In Cornwall?—Yes, I think so for all rates.

37,398. That is very much above the rates that appear on the returns; I am speaking of the rates in agricultural districts, not, of course, in urban districts. Your three ordinary rates would be the county rate, which seems always to have been under 5*d.*?——The union in which I live is the St. Germans Union, and I should think the St. Germans Union would be low—it would probably be under 3*s.*

37,399. Would it not be very much under 3*s.*?—No, I should not think it would be.

37,400. The poor rate seems to have been for some years past under 1*s.*, I am speaking of the poor rate, out of which all the expenses except the county rate and the highway rate are payable. Then you have your highway rate, which would be very exceptional if it came to a shilling; and then you have a county rate of about 5*d.*?—The highway rate I fancy would be about 8½*d.*

37,401. That would give you very little over 2*s.*?—I fancy St. Germans is somewhere about 3*s.*, but I will not be certain about that, as figures are rather difficult to remember.

Work of farmers and labourers compared.

37,402. (*Mr. Chaplin.*) I think you told us that a farmer in Cornwall very often did twice as much work as a labourer?—Yes; he works much longer hours.

37,403. Do the farmers usually engage in manual labour themselves in that county?—As far as I know, all of them.

Mr. D. Collins.
6 Dec. 1894.

37,404. And one farmer as a rule, in your experience, will do as much work as two labourers?—I should say so, certainly, taking the county through.

Security of tenure.

37,405. I think you said you would like to see greater security given to good tenants in their holdings; in what respect is that?—Where men are breeders of prize cattle and sheep, and so on, and use a large amount of feeding stuffs, and have to provide a certain amount of extra accommodation for themselves in excess of what the landlord or the agent might deem desirable, I think undoubtedly that those men ought to be secured in an exceptional way if it can be done. I believe it is capable of being done by covenants in leases, and that it is done.

37,406. Have you any suggestions to make to the Commission for any amendment of the law in that respect, or do you prefer to rest your desire for improvement on better agreements?—I do not think anything can be done by legislation in the matter of doing justice to either one party or the other, because circumstances vary so much.

37,407. Is it the case in Cornwall that much building or much accommodation is provided by the tenant himself?—I do not know of a single instance where it is so.

37,408. Where it is provided?—I do not know of one instance.

37,409. But if that is so the want of security in that respect would not exist, would it?—No, not for buildings; but what I meant was more the purchase of temporary accommodation for the care of his sheep and stock.

37,410. As regards the outlay upon manures and artificial food—which he is bound to get compensation for now, is he not, either under the Act or a substituted agreement?—Yes, he would get it no doubt up to a certain point, but I do not know whether he would as a rule; it is very difficult to give a good man sufficient compensation.

37,411. In consequence of the counterclaim?—Yes.

Mr. D. Collins.
6 Dec. 1894.

37,412. Do you wish to see any alteration made in that respect?—No, I do not think that it is possible to make any alteration.

Fall in prices.

37,413. Whatever the extent of depression may be in Cornwall I understand you to say that you regard it as being absolutely due to the fall in prices?—Yes, it is due to no other circumstance.

Amendment of Agricultural Holdings Act.

37,414. I suppose from what you tell us you would not be disposed to regard any amendment whatever of the Agricultural Holdings Act, whether it was desirable or not as any remedy for agricultural depression?—None whatever.

System of farming in Cornwall.

37,415. (*Mr. Little.*) I think you attribute the comparative success of the Cornish farmers very largely to the particular style of husbandry that they adopt?—I do very largely, and to their exceptional industry.

37,416. Although they have a large quantity of arable land, they do not depend to a very great extent upon their corn crops?—I do not think from what I have learnt recently that a single tenant of mine will sell a quarter of corn this year; they will consume it all.

37,417. So that although an arable county statistically, it is really a pastoral county, because the arable land is employed for years together in growing grass?—That is so.

37,418. You have a climate particularly favourable for this pastoral agriculture?—Yes.

37,419. And you have great natural advantages in the shape of sea-sand and manure on your shores, have you not?—Some of the land would be absolutely valueless if it were not for the sea-sand.

37,420. The sea-weed is more valuable, is it not?—The sea-sand is the more valuable; it contains about 80 per cent. of lime.

The witness withdrew.

Mr. R. S. Olver.

Mr. Richard Sobey Olver called and examined.

Mr. R. S. Olver.

37,421. (*Sir Nigel Kingscote.*) Are you a tenant farmer?—Yes.

His own farm.

37,422. Of where?—My farm is near Bodmin, in Cornwall. About the centre of the county.

37,423. Have you lived there all your life?—Yes. I farm about 650 acres. I have had it about 30 years myself, and my father had it about 20 years before.

37,424. Then you, if I might say so, were bred and born in Cornwall?—Yes, I am a Cornishman. I and my family have been on this particular farm for 50 years.

37,425. Do the 650 acres make one farm?—No, 500 acres belong to one landlord, and 150 to another. The two holdings adjoin and are like one farm.

37,426. Is it all light land?—Yes, it is generally light land in our district.

Fall in prices.

37,427. What, in your opinion, is the primary cause of agricultural depression?—I think foreign competition, without a doubt.

37,428. The fall in prices?—Yes.

37,429. Since when do you think that has begun to take effect?—I think from about 1879 and 1880.

Bad seasons.

37,430. Have the different seasons had much to do with it?—Last year we suffered very much. That was the greatest blow, I think, the Cornish farmer has had, because he did not produce half enough for his stock, and being heavy stock keepers they had to buy large quantities of feeding stuffs to keep their cattle alive.

37,431. Did you also suffer in 1879—to go back as far as that?—We did to a certain extent, that is on the wet lands the sheep got what we call "cawded," and they died in large numbers.

37,432. That is the "fluke"?—Yes; but on the healthy dry lands they did not suffer much. Individually, I never had a better year than 1879.

Foreign competition.

37,433. I understand that you think that low prices have been the great cause of agricultural depression?—Yes.

37,434. Have you any opinion as to what has caused the low prices?—I think it is the importation of everything from abroad; I do not see any other reason. Do you mean the causes abroad or here?

Depreciation of silver.

37,435. Altogether; everywhere?—I fancy the silver question must have something to do with the low price of wheat.

37,436. The low price of silver?—Yes, in Argentina and India, and those places where they have the silver coinage so depreciated it must have a great effect.

37,437. (*Mr. Chaplin.*) Do you mean in Argentina or in India?—I mean both Argentina and India.

37,438. (*Mr. Giffen.*) The Argentina is not a case of a country with silver money, is it?—I think gold is at a premium of over 200 per cent. there.

37,439. It is paper money there, not silver, is it not?—There is a depreciation of the coinage there if you like; it is the same thing. They pay their wages in this depreciated paper, and send it here and get our gold.

37,440. Still it is not silver, it is paper?—Yes, paper if you please.

Effect of depression on landowners.

37,441–2. (*Sir Nigel Kingscote.*) You can only state broadly that you think that has had an effect. Then as regards the effect of the depression on the incomes of landowners what would you say; have they lost in their rent?—Our county varies very much. In some parts the produce is just as good as ever it was; in other parts it has gone down like other parts of England. For instance, where they produce butter, pigs, poultry, and small things, you can hardly say it has depreciated much; therefore the land has not gone down much, but in the arable districts it has gone down 10 or 15, or 20 per cent.

Condition of occupying owners.

37,443. As regards the incomes of occupying owners—small owners we will say—have they done better than the tenant farmers or worse?—That depends on their position. If they are encumbered in any way, I think they are worse off because they have to do all the repairs; but if they are free, I think they have done better because they are allowed to crop and sell what they like—they have freedom of cultivation.

Mr. R. S. Olver.

6 Dec. 1894.

Restrictions on sale and cultivation.

37,444. As a matter of fact as regards the tenant farmers in Cornwall are they much hampered by want of freedom of sale and cultivation or not?—Yes, I think they are—too much.

37,445. Too much?—I think so, a great deal too much. I think it is very unfair in these days when he practically sells no grain, that he should not be allowed to sell hay and those things which he produces in the place of it. On many estates they do not allow the farmers to sell hay and very little straw.

37,446. Are those restrictions enforced?—Yes, on many estates.

37,447. Even if a tenant is not leaving his holding?—Yes, decidedly they are.

37,448. (*Mr. Chaplin.*) Would you go so far as to say they are commonly enforced now?—Yes, certainly; I could give you the names of large estates where I know they are enforced.

37,449. Even where the tenant wishes to sell?—Yes, at all events he has to ask a favour of his agent or landlord, which I think he ought not to have to do.

37,450. Apart from that have you found, especially during the last year, where the tenants have made a reasonable application to be allowed to sell, that they have been refused permission?—Yes, but very few had any to sell.

37,451. Commonly?—Yes.

37,452. (*Mr. Clay.*) You heard the evidence of the last witness to the effect that they have nearly free liberty of sale?—Yes, I heard it.

37,453. You do not agree with that?—I am a tenant and he is a landlord.

Condition of smaller tenant farmers.

37,454. (*Sir Nigel Kingscote.*) Have the smaller tenant farmers suffered to the same extent when the labour has been done by their own families?—No, not to the same extent. In the west of Cornwall they are practically dependent on the dairy, the making of pork and so on; they buy a great deal of their grain, and are gainers by the low price of corn.

37,455. As regards the labour of those tenant farmers do they work as hard as, or harder than, a common labourer?—No, I do not think they do as a rule.

37,456. You do not think they do?—No. Ours is a stock country, and many of the farmers will see to their own sheep and help about the cattle, but would not stand in to the hard work of the farm as a rule.

37,457. But he would be employed more hours?—Yes, he would be.

37,458. And doing that himself he would not want what might be called to a certain extent skilled labour, such as a shepherd or a stockman, and therefore he would save wages in that way?—Yes. It is very commonly done by him, or his son.

Employment of agricultural labourers.

37,459. As regards the agricultural labourers are they generally well employed?—Yes, they are well employed indeed.

37,460. Is there any competition for labour in your part among other works or manufactures?—Yes; we have a great deal of the china clay industry in our district. That is a big trade which has sprung up within a few years, and many thousands of men are employed on it. Our men go there to a great extent.

37,461. Which do they prefer do you think, the agricultural work or employment in these works?—I think they like the clay best, because of the shorter hours; they only work about eight hours as a rule.

Wages of labourers.

37,462. What do the wages in your part of the world average?—A great many of our agricultural labourers, most of them I may say, have privileges; that is they have a good cottage and garden free, and they have generally a certain amount of faggot wood given them; and we give them land to put their potatoes in, which we manure and work for them. I give 13*s.* per week with privileges; I think it is worth about 17*s.* or 18*s.* a week.

Condition of cottages.

37,463. As regards the cottages in your neighbourhood are they in a fair condition?—Yes, fairly good generally.

37,464. (*Mr. Elton.*) The last witness, I think, said they had about 20 yards of land; does that agree with your experience?—That means 20 poles, but we call it yards. It is really more than that, because our Cornish perch is larger than the imperial perch.

37,465. What is the length of the Cornish pole?—18 feet.

Mr. R. S. Olver.

6 Dec. 1894.

37,466. (*Sir Nigel Kingscote.*) Has the condition of the labourer improved or not, do you think?—It has much improved since I commenced business.

Improvement in condition of labourers.

37,467. In what way—is he able to get provisions and clothing cheaper?—Yes, he gets everything cheaper, better wages, and is generally well employed.

37,468. Has the improved machinery helped him or not?—He does not work so hard. The machinery does much of the hard work. A great number of our best men emigrate to New Zealand and other colonies.

Technical education.

37,469. As regards the education of the children, have they been helped in that direction?—Yes They are all freely educated now. I think we have improved our young men by having technical education such as ploughing and hedging competitions.

37,470. As a rule—I am talking now of the agricultural labourers—are the young men as good at their work as their fathers or grandfathers were?—I have not found very much difference. I think we have good men now, but the young men do not care so much for farm work.

37,471. At the same time you think that technical practical work would be of great benefit?—It has done them a deal of good.

37,472. It has done good already?—Yes, a great deal of good. It is a stimulus; they do not care for lectures or night schools, but take great interest in technical education.

Land out of cultivation.

37,473. Is there any land out of cultivation in Cornwall that you know of?—Practically none.

Deterioration in cultivation.

37,474. Has the arable land deteriorated in cultivation in consequence of the employment of less labour or of its not being manured in the way in which it used to be?—Yes, I think the arable land has gone back a good deal. The cultivation is not so well done generally.

37,475. How about the grass land, has that suffered too?—I do not think it has suffered so much, but the fences and gates are not so well kept; the land itself is pretty much the same.

Loss of farmers' capital.

37,476. Altogether the county does not present so good an appearance as it used to?—No, not so good.

37,477. Do you think the farmers have diminished their capital of late years?—Yes, many of them very seriously.

37,478. Is that from not having been able to produce what they used to produce, or merely because what they have produced has deteriorated?—I think it is due to the low prices; they have been hoping things would improve, and have held on, but instead of that prices have gone lower. And then the very bad season we had last year made things worse.

Changes in system of farming.

37,479. I suppose there has been a growing tendency to increase their stock and to lessen their arable land and their corn land?—They have lessened their corn, but I do not think they have increased their stock much.

37,480. You do not think they have?—No, I do not think it has had that effect to any great extent. Ours is a stock country and does not depend on the sale of corn.

37,481. Have they tried to develop any other industry, or to see whether any different crop would help them?—No, not much; the tendency is to let the land down to grass for four or five years instead of breaking it at the second or third year to save labour. In some parts they have gone in more for the dairy and growing pork and also fruit farming.

Changes of tenancy.

37,482. Have there been many more changes of tenancy owing to the depression?—Yes, there has been a good deal of late, and I think there will be more unless there is a change in prices. Men are getting tired of it; they think there is no chance of improvement, and many are inclined to give up.

37,483. A good many farmers from your county have gone into other counties, have they not?—Yes, they have gone to Essex, Gloucester, Hertfordshire, and other counties. Our best men are continually going away.

37,484. Have you any idea whether they have done better out of their own county or not?—They say they have done better.

Mr. R. S. Olver.
6 Dec. 1894.

Migration of farmers.

37,485. Is that because they found the rents lower, or to what do they attribute it?—I think one reason is that the rents are lower, and another is that being near the big towns they sell their straw, hay, and other produce at a greater advantage than they can do with us.

37,486. I suppose the difficulty of access to a great many of the farms in Cornwall is very much against the farmer?—Yes, it is, no doubt, but practically we sell live stock that walks away; we do not sell much corn or heavy produce.

Education rates.

37,487. Have your rates increased?—I do not think our ordinary rates have increased very much. I think they keep pretty much the same, but the education rate is very heavy in some parts.

37,488. Have you a school board, or are they voluntary schools where you are?—I have them both; I am in two parishes; in the one there is a voluntary school and in the other a school board. I know one parish in our district where the education rate has been as much as 1*s.* 6*d.* in the £. It is down to 1*s.* 2*d.* now.

37,489. The education rate?—The education rate only.

Taxes on real and personal property.

37,490. Do you think that the rates and taxes are equitably levied now on property, or have you any remarks to make upon that?—I think the way in which they are levied is very unfair at present.

37,491. What is your opinion as regards all property contributing towards the maintenance of the poor to the highways, to education, and to sanitary works?—I think that all property ought to contribute. If manufacturers and merchants use the roads they ought to pay towards their maintenance. And the same as regards the poor. For instance, a farmer might be rated on 500*l.* a year and employ 10 men, and a manufacturer might be rated on 50*l.* a year and employ 100 men. The manufacturer ought to pay in proportion to the men he employs towards the poor and education rate.

37,492. You would like to see all property rated or taxed?—Certainly, I think it is very unfair that the land should bear so much of it.

Agricultural Holdings Act.

37,493. Is the Agricultural Holdings Act made use of in your county?—No, it is practically a dead letter.

Compensation for home-grown corn consumed.

37,494. Why is that—is the custom of the county considerably better?—No, we think the Act is unfair, because in our county nearly all the corn grown is consumed on the farm, and the Act does not allow compensation unless it is bought. If you buy cake you get an allowance, but for your own home-grown produce you get nothing.

37,495. Supposing that it was desirable that all home-grown corn should be compensated for, what check would you have?—I think it would be a simple matter. When a tenant is about to leave his farm let a competent valuer put a value on the corn before it is harvested, deduct what is sold, and allow for the balance.

37,496. Then you would apply it only to the last twelve months of the holding?—I would apply it the same as for other feeding stuffs.

37,497. Do you think there would be no difficulty in ascertaining and verifying the amount of corn consumed at home?—None, I should think.

Security of tenure.

37,498. I think you are of opinion that the present tenure of tenant farmers is not sufficiently secure—is that so?—It is not sufficiently secure now. We should see better farming if there was more security.

37,499. In what way would you give more security?—I think if a tenant makes an improvement on a property it ought to be worth to him as much as if he put his money into the funds.

37,500. Who would you have to settle this; would you have an arbitrator or would you have a court?—By arbitration, I think. What we want is a tenant to farm well, and not impoverish his farm at the end of his term. Now he often racks the farm to get a reduction of rent.

37,501. Have you thought at all in what way you would give him this security—how long it should be given to him?—I think if the farm was surveyed——

37,502. When he went into it?—Yes, and a strict account taken of it at that time, and again when he leaves. I do not see that there can be any fairer way of doing it. The difficulty now that the tenant farmer has is, if he improves his farm and goes to his landlord and wants a reduction, the landlord says: "I can make "no reduction. Your farm will always make its "money," and so the assessment committee says. But if he racks his farm and goes to the landlord and asks for a reduction, the landlord sees that he cannot make the rent and makes the reduction; and so does the assessment committee. That is very hard on the improving farmer; it is strongly felt all through our county, that the good farmer is not properly secured.

Mr. R. S. Olver.
6 Dec. 1894.

37,503. You think that when a farmer takes a farm that should be gone into, but whom would you have to examine the place at the end of 20 years, supposing the tenancy was to come to an end at the end of 21 years?—I think if there was a surveyor appointed for every district, that could be easily arranged; I see no difficulty about it.

37,504. An officially appointed surveyor?—Yes.

37,505. Who would appoint the surveyor, what body?—I never thought of that, but some Government body, I should say, would appoint a competent man in the district; there are always valuers all over the country. My own feeling is that the only way to compete with the foreigner is by growing better produce, and farming better, and that ought to be encouraged in every possible way. It is no good to half-farm the land.

37,506. You think that the present system of tenure does not give that confidence?—No. Every man feels that if he improves the land, as he ought to do, that he is putting himself into the hands of his landlord or agent.

37,507. And that at once hampers the manner of conducting his farm, do you think?—The feeling is that he puts himself into the hands of his landlord directly, and that he will not have fair play.

Improvements and repairs.

37,508. Generally throughout your county does the landlord make the improvements—the buildings and the draining?—There is very little draining done, but the buildings are generally kept by the landlords. Although a great many leases say the tenant has to do it, I think that practically the landlord does it.

37,509. Virtually the landlord puts them up and keeps them in repair?—That is the buildings, but not the gates. The gates are generally kept in repair by the tenant.

37,510. (*Mr. Elton.*) Does he find the timber, or something of that kind?—The rule in Cornwall is that the tenant does all to gates and fences.

37,511. (*Sir Nigel Kingscote.*) Do you mean that the rule in Cornwall is that the tenant does all the repairs?—No, but he does everything to the gates as a rule.

37,512. And the landlord keeps up the buildings?—I think that is usual.

Law of distress.

37,513. Have you any opinion as regards the law of distress?—If we get better times, I would like to see the law done away with; but farmers at the present time are in such a depressed state that it would not do to call up their rents close. Now the landlord often gives them three or six months in hand. I think the present law is unfair to the merchant and to the man who can pay his way, because it allows men to come in and take farms who have not sufficient capital.

Ground Game Act.

37,514. As regards the Ground Game Act, has it been beneficial or not in your county?—Undoubtedly, it has.

37,515. Would you have it go further?—I think it is hard, where a tenant is occupying against plantations, which may belong to his landlord or somebody else, that he is not allowed to trap in the fence where the rabbits come through; he ought to be allowed to trap in these fences. The law does not allow him to trap in another owner's fence, and, therefore, he has no means of taking the rabbits.

37,516. Do you think that the number of rabbits generally speaking, throughout the county, has increased since the Ground Game Act, or not?—I do not think so generally.

37,517. Farmers have not kept them in order to try and eke out a profit?—We have a great deal of cliffs in our district, and there the farmers certainly allow them to increase and have made a profit out of them. I have known as much as a ton of rabbits a day sent away from one station. But then that does not apply to what I call the good farm land; it would not be allowed there.

Security of tenure.

37,518. May I understand what your remedies for depression are; first, I think, you said, better security of tenure, so that the tenants may produce better crops?—Yes.

Mr. R. S. Olver.

6 Dec. 1894.

Labourers' cottages.

37,519. Have you anything to say as regards labourers' cottages?—I think it is very desirable that we should keep the best men on the farms, and that the only way to keep them is by having cottages. We find that if the family is reared on the farm, the boys are worth more as labourers than if they had the run of the village, where they learn nothing They always learn on a farm. If a man has a decent cottage and garden he does not care to leave it.

37,520. Do you consider there is a deficiency in the cottage accommodation, generally speaking?—It is rather deficient in our district. Another thing I should like to say is, that men ought to be allowed in the villages or towns to get a piece of land to build on. There is very great complaint in our district about it. They can only get leases, which I think are bad.

37,521. Would you like to see freehold land obtainable by the labourer himself, in order to build his cottage upon?—Yes. They used to build them on leases, which I think is a bad system; if they could get a bit of freehold many people would build.

Loans for erection of cottages.

37,522. Would you advocate any plan for advancing him the money to obtain this land in order to build his house?—I think it would be very desirable, but I can hardly say how it should be done, that is more for the legislature, I am quite certain that it would be a good thing if it could be done.

37,523. Do you think the tenant farmer would suffer in any way if the labourer was made quite independent of him by having his own holding and habitation?—I think not, because his steady men should be in cottages on his farm, and the men from the villages would be useful to him in busy times.

Taxation of personal property.

37,524. Then another remedy, I think, you say, is that all rates chargeable on land should be reduced and placed on personal property?—Yes, I think it is unfair that the land should have to maintain the highways, police, education, and poor.

Co-operation in sale of produce.

37,525. Do you think anything can be done in the way of the sale of produce off the land by co-operation?—I am afraid it is rather difficult. I happen to be vice-chairman of the co-operative association for the supply of manures of which Mr. Collins is chairman.

37,526. That association is for the purchase of things?—Yes.

37,527. But I ask you at this present moment about the sale of agricultural produce?—It would be a very good thing if it could be done, but I am afraid there are great difficulties about it.

37,528. That is hardly practicable?—It is hardly practicable I am afraid, I wish it was practicable.

Sale of produce by weight.

37,529. Do you think anything would be gained by selling agricultural produce—even cattle and sheep—by weight?—Yes, I think everything ought to be sold by the hundredweight, then if I was to take up an agricultural paper I could see the value of an article in the other counties; now we know little about it.

37,530. You would then wish to have an equalisation of weights and measures throughout the country to begin with?—That is what we want.

37,531. (*Mr. Dalton.*) That is what you meant?—Yes.

37,532. (*Sir Nigel Kingscote.*) I thought you meant you would sell cattle by so much a hundredweight instead of selling a beast for 20*l.*, say?—I would like to see that done too.

37,533. But you would also like to see equalization of weights and measures?—Yes, certainly.

37,534. For everything?—Yes; I think there is no weight equal to the hundredweight of 112 lbs.

Compulsory sale by live-weight.

37,535. (*Mr. Lambert.*) Would you like to have it compulsory between buyer and seller that fat cattle should be sold by weight?—Yes, that is my own opinion.

37,536. (*Sir Nigel Kingscote.*) Would you like to see a weighbridge in every market?—Yes, and do the same as they do in America—agree on a price per lb. and weigh it. Barley, wheat, and everything else should be sold by the same weight.

37,537. (*Mr. Clay.*) Would you have that made compulsory?—Yes.

Marking of foreign produce.

37,538. (*Sir Nigel Kingscote.*) Another thing you would like to see, I think, would be that all foreign meat and other agricultural produce coming from abroad should be marked as such?—Yes.

Mr. R. S. Olver.

6 Dec. 1894.

37,539. Do you see any difficulty as regards meat?—I have no doubt there is a difficulty, but I think, as a rule, difficulties can be got over, if tried. I think the legislature could certainly find some means of letting it be known that foreign meat should be sold as foreign.

37,540. Would you apply that to English produce as well?—Yes, I think so. Butter should be sold as butter, and anything else should be sold for what it is—and very strictly enforced.

Railway rates.

37,541. As regards railway rates—do you think the agricultural producer has reason to find fault with the railway rates?—Yes, they are very oppressive in our part of the world. We grow early potatoes, flowers, cauliflowers, and similar crops to a large extent; but the cost of sending them away is so great that they are not grown nearly so much as they might be. It is the carriage that does away with the profit.

37,542. As far as you are aware, and as far as your opinion goes, do you think that English produce is unduly rated compared with what the foreign is?—Yes.

37,543. On the same railways?—On the same railways. I believe it is known that you can bring fruit from Normandy to London much cheaper than you can from Kent. I do not see why that should be.

Freedom of sale.

37,544. (*Mr. Clay.*) You have given evidence in favour of freedom to sell straw and hay off your farms. Did you hear the last witness, who is a proprietor in Cornwall, say that the sale of hay and straw was generally allowed?—Yes, but I know it is different in our district.

37,545. You do not agree with that part of his evidence?—No.

37,546. You, as a practical man, who knows very much about farming in Cornwall, say that it is not a general rule for either landlords or land agents to grant that privilege?—No, it is not the rule generally.

Wages of labourers.

37,547. You stated what was the wage per week which the labourer had, and that then there was his cottage and his fruit garden and his potato land. How much potato land has he?—It is rather more than the eighth of an acre, about the seventh of an acre I should say. Then we manure and cultivate that for him; all he has to do is to put in the potatoes. We give him firewood and milk and several things of that kind. I always let my men have a bacon pig at a fixed low price, 4*d.* a pound, which is cheaper than they can fatten them, so that they should not have the temptation to take corn.

37,548. (*Mr. Little.*) Is it the practice to let out cows to labourers?—Not in my district.

Deterioration in cultivation.

37,549. (*Mr. Clay.*) I understood you to say that the arable land has been rather going back in fertility?—Yes, there is less labour employed on it.

37,550. Is that for want of capital on the part of the tenant?—There is something in that, but I think many do not employ sufficient labour. They are reducing their expenses as far as possible, and the work is not well done.

37,551. Does that arise from the want of capital?—To a great extent, undoubtedly, and they feel it will not pay them to do it with present low prices.

Remissions of rent.

37,552. We were told also by the last speaker that you have remissions of rent in Cornwall, but that you do not have the rents reduced permanently?—Yes, that is so.

37,553. Would it not have been better if the landlords had seen their way to give permanent reductions, and not to have charged more for the land than the produce could pay the rent of?—Yes, I think it would be very much better. When a tenant gets a permanent reduction he goes to the Assessment Committee and gets a reduction of his rates; but if a man only gets a temporary abatement he has to pay his rates in full.

37,554. And then both landlord and tenant are paying the rates upon a rent which has never been paid or received?—I mean to say that the one having the temporary abatement gets no relief from the Assessment Committee, while the one who has the rent of his farm permanently reduced gets a reduction of his assessment. That is unfair to the man who has only a temporary abatement.

37,555. The assessment committee would not lower the assessment to a man who simply had a temporary abatement?—They never will allow it.

37,556. So the landlord and the tenant would be paying rates upon a sum of money which was not being

Mr. R. S. Olver. 6 Dec. 1894.

paid or received as rent?—Yes. It has been complained of through our district that the assessment committees will not recognise any temporary abatements.

37,557. (*Mr. Dalton.*) But they fix assessments by the rent?—Almost invariably.

37,558. Then in your neighbourhood a different rule prevails to what we were told prevailed in the neighbourhood where the last witness came from; he seemed to think that they did not take rent into account?—I know it is as I have stated in our case, for I was on the assessment committee for years. It has always been the rule in our case. I thought it was the case throughout the county.

Division of rates between landlord and tenant.

37,559. (*Mr. Clay.*) Does a tenant pay all the rates upon a farm?—Yes.

37,560. Would it not be a more equitable plan to do the same as we do in Scotland, where the landlord and the tenant share the rates?—I think they ought always to be shared.

37,561. You have the landlord to a large extent laying on the rates and the tenant pays them?—Yes.

37,562. But you consider that unjust?—Yes, I think they ought to be equally divided.

37,563. You consider that the landlord laying on the rates, and the tenant paying them is rather the wrong way about?—Yes.

37,564. (*Mr. Little.*) Would you allow me to ask how the landlord lays on the rates?—I think that if there is an increase after the farm is let, at all events the landlord ought to share it.

37,565. Mr. Clay's question was that the landlord laid on the rates for the tenant to pay, has the landlord, as a landlord, anything whatever to do with the laying on of the rates at the present time?—If he is a Member of Parliament he might put on the education rate, which the tenant has to pay.

Agricultural Holdings Act.

37,566. (*Mr. Clay.*) Regarding the Agricultural Holdings Act I gather from you that it has been virtually a dead letter in your county?—Yes, it is never used in our county; I do not think there has been a case of its being used; at any rate I do not know of one.

37,567. Are you of opinion that in the present state of matters the tenant farmer will not risk putting his money in the land in order to keep up its general fertility?—He will not farm as highly as he should because he is not protected.

37,568. Who suffers in the long run?—The general public. I should think everyone suffers. The landlord suffers in the end, but he does not always see it; if his land is let go back he must suffer, naturally.

37,569. Although the Agricultural Holdings Act has not taken exactly the position in your county that it should have taken, your distinct opinion, as I understand it, is that you see no other way of bringing capital back to the land than by giving a tenant a *bonâ fide* security for the increased value which his improvements add to the holding?—That is what we want.

37,570. Would you like to see the Agricultural Holdings Act simplified in its procedure?—Yes.

37,571. And lessened in expense?—Yes. It is too expensive and complicated.

Official referees.

37,572. I think in part of your evidence you went on to say that you would like to see one man, called an official referee, appointed by the Government, to go and do the work between landlord and tenant?—I do not see any other way myself. I have an idea that Lord Ashbourne's Act, which is in force in Ireland, might often be useful especially where they go in for the growth of fruit and small crops. I believe that if men had some means open to them by which they could buy the land and pay it off in instalments, they would plant trees and do other things which they cannot possibly do now.

37,573. In commercial life a man would not go into a mortgage with no security behind him?—That is it.

Security of tenure.

37,574. It is the same with a farm: a man would not invest his money without security?—That is so. In our county we have a great deal of what is called "common land" which many years ago they did grow wheat on when wheat was high. Now sheep and bullocks are kept there in the summer, and are put on the farms in the winter; but in consequence of the low price of stock this land is scarcely worth anything. I think it is a great pity that so much of the land is lying

Common land.

idle. I think there is a certain class of men who would be only too glad to take up this land if they could have security. There are thousands of acres lying almost idle although the land adjoining is very fair.

Mr. R. S. Olver. 6 Dec. 1894.

37,575. (*Sir Nigel Kingscote.*) Are there no rights over it?—Yes, but the common rights are worth nothing now, and the tenants scarcely use them.

37,576. But I suppose you would have great difficulty in buying those common rights up?—I suppose there would be a difficulty. It does seem a pity, when numbers of men out on the moors would only be too glad to have it.

Compensation for corn consumed.

37,577. (*Mr. Clay.*) The Agricultural Holdings Act recognises the expenditure for cakes and manures, and you think that all corn consumed on the holdings should be allowed for?—Certainly.

Compensation for laying land down to grass.

37,578. But there is another very important point which I think will come before the people very soon. I mean that if a tenant lays down land to grass and feeds on it with cake and other manures the Agricultural Holdings Act should give compensation, and a liberal compensation for making that grass land?—I think so too. It seems to me that it is a great pity when, as is often done in our district, tenants have laid down land to grass they should plough it up on leaving the farm; if fairly compensated they would not plough the land.

37,579. If they could be reasonably compensated they would not plough it, and it would be far more valuable to the landlord or to the incoming tenant than it would be by ploughing it?—Yes.

Compulsory sale by live weight.

37,580. Then on another point put by the Chairman, namely, with reference to adopting the American system of selling cattle by live weight, I think you agreed with him?—Yes, I should like to try it.

37,581. So that a tenant could be up sides with the butcher or the jobber, as you may call him here, and would get all he could get out of the animal by the live weight shown on the scale when the beast went over the weighbridge?—Yes.

37,582. Indeed you would just follow out the American plan of selling by live weight, and you would not object to have it made compulsory?—I should like to see it tried.

37,583. Unless it was compulsory it would be of little value?—It would take trouble because the dealer for a certainty would be against it at first.

37,584. Is it not a very clear thing to the agricultural mind that the only men who are against it are the dealers and the jobbers who buy from the farmer?—They generally object to it.

37,585. Because the present system benefits themselves?—Yes, we suppose so.

Compensation for home-grown corn consumed.

37,586. (*Mr. Gilmour.*) I think you expressed yourself very strongly in favour of the tenant getting compensation for all the home-grown produce consumed on his farm?—Yes.

37,587. Have you thought out how best to prevent fraud in that matter?—Yes.

37,588. Did I understand you aright to say that you considered the proper way to do it was to value the crop on its legs?—Yes, I think so.

37,589. Do you suggest that it would be practicable to do that all over the district?—It is very commonly done in our district. Almost all the farms are entered in that way. When the corn is ripe, the valuers value it as it stands; it is much easier to value it then than when it is in a stack.

37,590. Does not the value of the corn alter very much according to the weather it gets to the very end, and according to the activity of the men in harvesting it?—There is always a risk, but I do not think you can have one with less.

37,591. That is the only way you think?—I do not know of any better one.

37,592. (*Sr Nigel Kingscote.*) You have just said that with you the valuers value the corn as it stands; for what purpose is that, do you know?—Under the present Agricultural Holdings Act, the tenant is not allowed any compensation for the corn he may grow on his own farm.

37,593. I understand; but what I mean is that you said just now, it was very often done, and I asked for what purpose?—When a man is going into a farm, or

when he is quitting it, the corn is generally taken as it stands, valued just before harvest.

37,594. (*Mr. Gilmour.*) By whole fields?—All that grows on the farm.

37,595. You have some occupying owners I suppose in your district?—Yes, many.

Changes in system of farming.

37,596. Have they altered their mode of cultivation; they have a free hand to do so?—Yes, they have generally gone in for growing more grass; in fact, I may say practically that is the only alteration made in our district. Everybody is growing less corn, and more grass, and green crop.

Compensation for laying land down to grass.

37,597. Would the landlords, when asked, object to your laying down grass?—No, they certainly would not object. The point is that the land is more valuable after laying down to grass for seven or eight years, and the tenant thinks he ought to be compensated for not breaking it up again.

37,598. Would it be impracticable in these times to arrange with your landlord that you should get compensation for so doing?—I think it would in special cases; but I think a man ought to be safe without requiring him to do that. I think a man ought to be able to go to his landlord, and ask to be fairly paid for what he has improved.

Compensation for home-grown corn consumed.

37,599. Do you think it is right that the corn given to cart-horses on the farm, should be paid for by the landlord as compensation?—I do not know why it should not be, because, practically if the tenant likes to do it, he can sell all his corn, and buy in other corn, and then it would be allowed. I think it is much better for the man to consume his own.

37,600. (*Mr. Little.*) He would not be allowed for that consumed by his own horses, would he?—I will not go so far as to say that.

37,601. (*Mr. Gilmour.*) But that was the question?—In my own case, I am a pretty large breeder of horses and they are just the same to me as cattle; they are merely running, growing, horses; they are not working horses, and I do not see why I should not be allowed for them all the same.

37,602. I referred to horses employed in the general work of the farm,—the cart horses?—I think that you might leave those out. I do not know that it matters much; that is really a very small matter; the cattle and sheep are the great thing.

37,603. (*Mr. Little.*) What is the usual time of entry on a farm?—Generally Michaelmas.

Valuation of tenant right.

37,604. Under what circumstances is the crop valued before Michaelmas; does it pass from the outgoing tenant to the incoming tenant?—He takes it as it stands and harvests it.

37,605. He takes it at a valuation?—Yes.

37,606. And he harvests it?—The incoming tenant harvests it.

37,607. The incoming tenant harvests the growing crop of corn?—Yes.

37,608. And pays rent from Michaelmas?—Yes.

37,609. Does the valuation include the straw?—In a rough and ready way. Very often he is allowed the straw for the harvesting and marketing; but if he has paid for the straw, then he is allowed for the harvesting and marketing, which comes to just the same thing.

37,610. When he enters at Michaelmas does he pay for any other crops and cultivations?—He is allowed to enter upon a certain amount of land to grow a green crop; or else he has generally an arrangement with the outgoing tenant; sometimes the outgoing tenant sows the green crop, and the incoming tenant pays for it.

37,611. He pays for the green crop?—He often pays the value per acre for the green crop as it stands.

37,612. He pays the value of the crop?—Yes.

37,613. How is all this settled; is it by custom, or is it settled by agreement in each case?—I think you may practically say it is custom; it is nearly always done so and is quite the custom of the district.

37,614. The custom so far gives nothing to the tenant but the value of the straw, because he can sell the corn under any circumstances?—Yes, that is it. He is not allowed to sell the straw, and it is valued at consuming price.

37,615. No, but he does sell the straw you say; the straw is valued to the incoming tenant, and as a rule it is supposed to be valued at a price which will pay the cost of the harvesting?—Yes, that is very commonly done; they put the one for the other.

37,616. Is that the only compensation that the outgoing tenant really gets?—Yes, that is all he gets.

37,617. But by the Agricultural Holdings Act he would be entitled to compensation for the manures he has used?—Yes, but practically perhaps when he is leaving he does not use much manure.

37,618. Do you mean because he dare not claim under the Act, or because he does not claim?—It is so troublesome and expensive that they will not have anything to do with it.

37,619. Where is the particular trouble?—There are forms to go through, which the tenants have never been accustomed to, as they go on in the old way. I never knew a case of its being used, and the tenants do not know what claim the landlord may make.

37,620. I suppose agreements exist?—Generally.

37,621. Is it usual in these agreements to provide any compensation for manures?—Very seldom.

37,622. Not any?—Very seldom, I believe.

37,623. Then, of course, they do not provide for compensation for the corn consumed?—No.

Compensation for land laid down to grass.

37,624. (*Mr. Chaplin.*) In regard to the question of compensation for land laid down to permanent grass; I understand you to hold the opinion that it would be much better, not only for the tenant who is going out, but for the incoming tenant and the landlord, that the land should remain in grass rather than be broken up again?—Yes, certainly.

37,625. You wish to accomplish that object by some alteration in the law, I understand, which would ensure the tenant compensation for it?—Yes, that is so.

37,626. I suppose on leaving in such a case you would have the power of breaking it up again, and ploughing it up again if you pleased?—Yes.

37,627. Does not the fact in itself give you an opportunity of making a fair arrangement for compensation with your landlord?—I admit that it can be done; but a very common practice is, when a man thinks he has to leave that he will take two crops of corn from the field, and leave it in an impoverished state.

37,628. Having been laid down to permanent grass, he goes and ploughs it up?—Yes.

37,629. Although it would pay all parties to go to the landlord and make an arrangement? Could not the tenant say, "I can plough this up unless you give me compensation?—Yes, but very commonly the agent or landlord does not know much about it, so the tenant says, "I will not have any trouble. I will plough it and then I am safe."

37,630. In the case of a landlord or agent who understands his business, and looks after it, that difficulty would not arise?—No, still I think it is much better to make it legal, and not to depend on agreement.

37,631. I am not contesting your view, I am only anxious to understand whether it could not be arrived at without a change?—It could be.

Counter-claims under Agricultural Holdings Act.

37,632. I understood you to say just now with reference to the Agricultural Holdings Act, that in some cases it did not work, because forms were necessary which the tenants were not accustomed to?—Yes.

37,633. Would not that apply to any legislation?—I think this Act is very complicated. The difficulty, as far as I can see, is that landlords may make claims which run to a lot of expense; you often read it in the papers, and tenants will not run that risk.

37,634. The counter-claim is the real difficulty?—That is the difficulty.

37,635. Yet, of course, you yourself would admit that where the land has been neglected and dilapidated a counter-claim is only fair?—To a certain extent; but I think it is carried too far very often.

37,636. But that is the real difficulty which presents itself to the farmers, I suspect?—Yes, I think so.

Rent and tithe of farm.

37,637. (*Mr. Dalton.*) What rent do you pay for your farms?—Mine cost me about 1*l.* an acre, but then I have to pay the tithes besides.

37,638. What do the tithes come to?—The tithes would come to 4*s.* or 5*s.* an acre.

Mr. R. S. Olver. 6 Dec. 1894.

37,639. Is that the average rent for your part of the country?—The land in our district varies very much. There is land in our parish let at 10*s.* an acre, and some as high as 4*l.*

37,640. Have you had your farm very long?—My family have occupied it about 50 years.

37,641. Has the rent been reduced on the whole?—It has gone up.

37,642. During how many years?—50 years; I have occupied it 30 years, and my father had it 20 years before me.

37,643. Can you give us any idea of the fluctuation of rent during those 50 years, to what extent it has altered; and when it was highest?—It is highest now, I have never had any permanent reduction. I was one of the unlucky men who took a 21 years' lease in the good times, and my lease has not expired yet, so that I am as high as I have ever been.

Reduction of rent.

37,644. Do you consider that the reduction of rent has been general in your union, going back for some time, namely, 50 years?—Yes, I think it has been.

37,645. There has been a reduction?—Certainly there has been a reduction in the last 10 or 12 years.

37,646. I mean, taking the present rent and comparing it with the rent paid 20 or 30 years ago?—Yes, it is less.

37,647. There is a reduction?—Certainly; it did go up to a point, and then went back again, but now it has got below the original; there is no doubt about that.

37,648. But in your case it is higher than ever?—Yes, I have never been higher than at the present time.

Agricultural depression.

37,649. I think, as I gather from your evidence, you do not agree with what the previous witness said, that farmers have maintained their position until the last two years?—No, I think they have been going back gradually for years past.

37,650. For how many years?—I may say from 1879. They have always been hoping that times would improve. When a man is in a farm he does not like to move; he tries for another year; then it gets a little worse than before, and so it goes on.

Letting of farms.

37,651. When a farm is vacant in your district, does it let readily?—Yes, there is never much difficulty in letting anything like a moderate sized farm.

37,652. At this slight reduction that you have mentioned?—Yes.

Changes of tenancy.

37,653. You say there have been more changes of late years owing to the depression, and that many farmers are going into other counties where rents are lower; are those farmers going away mainly because the rent is too high?—Yes; they think they can do better in other parts. They have probably applied to the landlord for a reduction, and he will not give it; and they say, "We will go somewhere else," and they have gone to other counties.

37,654. When a farm becomes vacant, does the landlord have to let it at a reduction?—I think so, as a rule, now.

37,655. So that the landlords, generally, do lose money?—Yes.

37,656. Where do the people come from who take the vacant farms; from the neighbourhood, or do they come out of other counties into Cornwall?—They do not come from other counties. I scarcely ever knew an up-country man come into Cornwall. Almost always the men from the west come to the east.

Migration of Cornish farmers.

37,657. You have got as many farmers as you had in Cornwall, and yet you are sending your farmers to other parts of the country?—Yes, the young men go away. You see we have no great manufactures, and, as there are a large number of farmers, and their sons have no other opening, they learn farming, and get a farm where they can.

Rates on real and personal property.

37,658. Then, I think I understood you to say that rates should be levied on personalty?—I think so.

37,659. Take your own union, the Bodmin Union, do you mean that they should be levied upon the personalty situate in that union?—I think so.

37,660. Would that make much difference to you; what kind of personalty would you bring under contribution in the Bodmin Union, which does not now contribute to the rates?—It is rather difficult to say. Take the case of an employer of a large amount of labour, if his men are injured we should have to maintain them, and we should have to educate their children, and to maintain the highways which he uses. He ought to pay on much more than the value of his house.

Mr. R. S. Olver. 6 Dec. 1894.

37,661. Have you got many manufacturers in your union?—Not large ones.

37,662. Then is it the shopkeepers who, you think, do not pay sufficient?—There are tradesmen and merchants who use our roads, and who pay scarcely anything towards their cost.

37,663. Have you got many such people; would it make any material alteration in your union if you brought those people under contribution?—Certainly.

37,664. Is there such a number of them?—There are a good many of them in the union.

37,665. You are aware that very large contributions from the Government have come to your district in aid of the rates?—Yes.

37,666. It has been 54,000*l.* a year in your county from the local taxation account alone, which is equivalent to a relief of 9*d.* in the pound in the county. Then, in addition to that, you have the education grant which, I suppose, is large?—Yes.

37,667. What does that amount to in the £, do you know at all?—I could not say, it varies so much.

Effect of reduction of rates.

37,668. Supposing you were able to reduce the rates considerably, do you think that would benefit a tenant, or would it get put on to his rent? Which of the two do you think it would benefit, the landlord or the tenant?—I suppose in the end it would be the landlord, but the tenant would derive the benefit during his lease.

Tithe rent charge.

37,669. Then it is not very much a tenant's question?—Not very much. There is another question that I wish to speak on, that is, taking the average of tithes. There is a strong feeling on that point in our district, where the barley is of a third-rate quality; it is thought to be unfair that our tithe should be taken upon the barley from Norfolk and other counties where they grow better barley. We think that every county ought to be taken by itself.

37,670. Is your tithe of 4*s.* an acre an exceptionally high one?—No, it is just the average. The parishes vary very much. Some parishes are rated much higher than others.

37,671. (*Mr. Lambert.*) You speak as a tenant farmer?—Yes.

Remissions of rent.

37,672. What are the remissions of rent, generally, in your district?—About 10 per cent. as a rule—from 10 per cent. to 15 per cent., occasionally 20 per cent.

37,673. In your own case, have you applied for a remission of rent?—No, because I have a lease.

37,674. What made you take a lease of 21 years?—Because the times were very good when I took it.

37,675. I presume it gave you some security in your holding?—It was well known that I had laid out a good deal of money on the farm, and I thought it might make me more secure.

37,676. Rents have been reduced from 10 to 15 per cent., but by how much has agricultural produce been depreciated in value?—Wheat has gone down more than half.

Fall in value of agricultural produce and reduction of rents compared.

37,677. I want your evidence, not mine?—Wheat has gone from 40*s.* a quarter down to less than 20*s.*, so that is half in wheat, which was one of the main things we grew. Then when you come to beef that has gone from 70*s.* a cwt. down to 50*s.*, and wool has gone from 1*s.* 4*d.* down to 7*d.* It is rather difficult to give an average.

37,678. Supposing that you are asked to give an estimate per cent. as to the amount that agriculture produce has depreciated in value, what would you say?—So much depends on what you might grow upon your farm, and what your farm is useful for.

37,679. The estimated per cent. of what you grow in your part of the world?—I should say from 30 to 40 per cent.

37,680. And yet rents have only been reduced 10 to 15 per cent.?—No, but manures and other articles are cheaper.

37,681. Do you agree with the view that prior to the depreciation of agricultural produce, farmers were not paying rent enough?—No I do not, because

Mr. R. S. Olver.
6 Dec. 1894.

it has been the custom of our country to let by tender and you may depend upon it that always kept it up to the full value.

Letting of farms.

37,682. Coming to that point of letting by tender, if ten men are tendering for a farm, are they in the same position as the landlord in regard to their power of making a fair bargain?—Unfortunately, often if there is a man the agent wishes to have, he is told that he has not tendered sufficiently, that somebody has tendered more, but that if he likes to come up to that tender he may have the farm.

37,683. So that practically it is one farmer bidding against another to get the holding?—Certainly it is.

37,684. Holdings are very scarce in Cornwall?—They have been.

37,685. Therefore farmers are apt to give too much rent in order to get an opportunity of getting into a holding?—Yes, and they will often apply for a reduction soon after. They apply for a reduction and often got it.

37,686. (*Sir Nigel Kingscote.*) How many holdings are there in the county?—I cannot say. The holdings run from 100 to 200 acres as a rule, and down even to 50 acres.

37,687. (*Mr. Lambert.*) In many cases you said that new tenants were able to get the farms at less rent than the landlord would allow the old tenants to remain on at?—Very commonly, and more than that he would generally get more done for him in the shape of building and so on than the old tenant.

Diminution of farmers' capital.

37,688. Do you think the farmers' capital has diminished?—Very considerably.

37,689. Which do you think has diminished in the greatest degree per cent.—the farmers' capital or the landlords' capital?—The farmers'.

37,690. The farmer has lost more, in proportion, of his capital than the landlord has?—Yes, I think so.

37,691. (*Mr. Elton.*) What did you mean when you said the landlords' capital?—I meant the value of the land.

Rents raised on tenants' improvements.

37,692. (*Mr. Lambert.*) Are there many instances in which the tenants have had the rents raised on their own improvements in your district?—Yes; formerly, but not now. Now very likely instead of getting a reduction as the bad farmer would they are kept on at the old rent.

37,693. So that an improving tenant is naturally at a disadvantage?—Undoubtedly.

37,694. And there are a great many such cases in Cornwall?—Yes.

37,695. A large number?—Yes, a great many of them.

Compensation for improvements.

37,696. Now as to compensation: Presuming that a man laid out 100*l.* upon the holding and it was worth 150*l.*—that that value was added to the lettable value of the holding—would you compensate him and give him compensation for the increased value over and above the actual outlay?—My idea is this, that if a farm was worth 1,000*l.*, and through the tenants good management it becomes worth 1,500*l.*, the 500*l.* belongs to the tenant.

37,697. Belongs to the tenant?—I think so, if the landlord has done nothing towards it.

37,698. So you would compensate a man according to the skill with which he has made an improvement?—I think so. Just the same as a hotel keeper, if he increases his business, makes so much more of the goodwill. I do not see why the tenant farmer should not have the same.

Compensation for disturbance.

37,699. Have you thought of the question at all as to where a man is capriciously evicted from his holding, in the case of an old tenant who could not get his rent reduced, being compensated for being disturbed?—I think he ought to be. We will take it in this way. Suppose a man may be on a farm for many years, he lays out his money and improves it, something turns up between him and the landlord and he is turned out, and there are no means of getting back his capital again, I think he ought to be paid under those circumstances.

37,700. I suppose it is a considerable cost to a tenant to move from one farm to another?—Yes, certainly.

37,701. And he ought to be compensated to the amount of that cost?—Yes, in some way.

37,702. (*Mr. Little.*) Would you describe as a capricious eviction a case where the tenant gives notice and because he cannot get his rent reduced leaves the farm?—I do not think so always.

Mr. R. S. Olver.
6 Dec. 1894.

37,703. Was that not the case the honourable member put to you about capricious eviction because the landlord will not reduce the rent?—It is so difficult to say—cases vary so much; you may find a man farming well and improving his farm, but cannot agree with his landlord, who may say he will give him notice to quit; he has no opportunity then of taking out what he has put in; then I think he ought to be paid.

37,704. I am not arguing the point, I am only wanting to know whether in your opinion when you answered that question you considered the two things the same—a capricious eviction, and a tenant leaving his farm because he cannot get a reduction of rent?—It is pretty much the same thing it seems to me.

37,705. (*Mr. Lambert.*) At any rate you would give compensation for disturbance in both cases?—Yes.

37,706. (*Sir Nigel Kingscote.*) Who is to assess that compensation?—As I said just now, if there was a valuer appointed for every district he would be the man to do it in every case.

37,707. (*Mr. Chaplin.*) That is rather an important matter; you say the improved value ought to be assessed by a valuer appointed for the purpose?—Yes, I think the tenant ought to be paid for everything that has been put there by him, and does not belong to the landlord—so as to encourage a tenant to farm as well the last year as he would for the 20 years before.

37,708. I quite understand the principle of compensating the man according to his outlay, but if I interpret what you say rightly, this is a proposal for something more. He is to be compensated for the disturbance, and that compensation is to be based upon the improved condition of his farm. Now I want to ask you in your own case—and I think you have told us that you have had the farm for 50 years—how is a valuer to know what the value of the farm was when you took it?—If a competent valuer were to go over my farm or anybody else's, he would see whether that farm was well cultivated or otherwise, and get evidence as to its former condition.

37,709. We will suppose that your farm, when you took it, was in a very improved state of cultivation; that is quite possible, is it not?—Yes, certainly.

37,710. Is there anything to enable a valuer to judge of how much more it has been improved; how can he form an estimate of what is a fair compensation to you, unless he knows what the condition of the farm was when you took it, and what the condition is when you leave it?—I admit that is a difficult point. At all events one can go as far as this. We can see that the man who is leaving, has taken so much out of the farm, but he has also left so much behind. You could see if he has drained or done permanent improvements such as laying down land to grass. I think he ought to be paid for these.

37,711. Certainly; all that he would be paid for now, under the Agricultural Holdings Act?—Not unless he got liberty from the landlord.

37,712. There is no consent required in the case of draining; it is only a notice that is required?—As a rule it is done without. I think the more you can make a man feel that he can improve the property, and get paid for it, the better he will farm; let a man feel that what he does is for himself, and not for somebody else.

37,713. Provided the man is fairly compensated for his outlay in the event of his having to leave, that is what you mean by compensation for disturbance?—Yes.

37,714. (*Mr. Lambert.*) Coming to that point again; presuming in this case that a tenant was paying 150*l.* a year for his farm, and that farm was only worth, according to a competent valuer, 130*l.* a year, and the landlord refused to let him have that farm for 130*l.* a year, and the tenant, therefore, had to leave, would you then give that tenant compensation for having to leave, irrespective of compensation for the improvements which he had made upon his holding?—That is a point which is rather difficult to answer; I do not think I could go as far as that.

37,715. That is the point of compensation for disturbance?—Yes. I should think he ought to be paid, as I said before, for anything that could be valued that

Mr. R. S. Olver.
6 Dec. 1894.

belongs to him, but the other I think is going too far; I do not think I would go so far as that.

37,716. You would not?—No.

Restrictions on cultivation.

37,717. As regards removing the restrictions on cultivation, would this carry out your view—do not let me put words into your mouth at all—presuming a tenant did not impoverish the farm, would you allow him to cultivate as he pleased?—Yes, as long as he did not break old grass land.

37,718. As long as he did not impoverish the farm?—He ought not to be allowed to break old grass land or impoverish the farm.

Ground Game Act.

37,719. As regards the Ground Game Act, would you give a tenant greater facilities for killing ground game?—Yes, I think so, more particularly for catching them in his own fences, either against his own or another landlord. The refusal to do that is the hardest thing I know of.

37,720. Would you give a tenant upon his holding the right to kill ground game as he pleased?—I should like to.

37,721. Do you think it would be desirable?—I do not see anything against it, I think it is pretty well done now.

37,722. Would you advocate all the restrictions as regards the killing of ground game being removed?—I do not think it would be fair to kill the landlord's winged game.

37,723. I said ground game; I mean rabbits and hares?—I think they ought to be careful of the winged game.

37,724. As regards ground game would you give tenants the opportunity of killing them as they pleased?—Yes, I would.

Appointment of official valuers.

37,725. By whom would the official valuer be appointed; that is, the valuer to assess this compensation?—I have never studied that, but I think the county council could do that.

37,726. Would you have this valuer appointed by the Board of Agriculture, or by the county council, or by the district council?—I should think the county council perhaps would know better than anybody else; they know the local men.

37,727. Is that what you meant by a government official?—I meant it in that way. I should say some competent man in the district.

37,728. He should be appointed by some local authority?—Yes.

37,729. By whom should he be paid?—I think he ought to be paid by the tenants; I do not see why he should be paid by the Government—let the incoming and outgoing tenants pay him.

37,730. By the parties who are privy to the transaction?—Yes, the same as in any other valuation.

37,731. Would you have a fixed scale of charges for these men?—Yes.

37,732. (*Mr. Elton.*) You have again used the word "Government," but you mean that the valuer should be appointed by a local authority?—I do not mean, of course, that he should be appointed direct from the Government. We want some department who would know whom to appoint.

Effect of depreciation of silver.

37,733. (*Mr. Everett.*) You have referred to the silver question in your evidence; have you paid any attention to that particular question?—I think it is evident that the Indian, who, for instance, pays his wages in silver which has depreciated 50 per cent., can sell his wheat cheaper than we can, because he gets almost double the value over here.

37,734. He can sell it for less gold here?—Yes.

37,735. And get the same amount of silver home?—Yes. With the paper money in Argentina it is just the same, and with Russia, I believe, it is just the same as India.

Size of farms in Cornwall.

37,736. (*Mr. Elton.*) I suppose there is no other farm in your locality as big as yours?—There are some nearly as large as mine.

37,737. You heard what the previous witness said—he supposed 600 acres would be the biggest farm in Cornwall?—There are several large farms in our district; mine is, perhaps, larger than most farms in Cornwall.

"Common lands."

37,738. About the moors, you said they had been previously in corn, but now they were turned into commons; do you think that is really so?—Yes, you can see the old ridges where they were ploughed. They were ploughed in the French war, and then let go back when the price of wheat went down.

Mr. R. S. Olver.
6 Dec. 1894.

37,739. Were they ploughed in large tracts or only small; in takes of seven acres here, and seven acres there?—Some were of as much as 1,000 acres in one place, and some were very small pieces. You can see the remains of the fences now, which were all pulled down after the French war.

37,740. They were actually thrown into commons again?—Yes.

37,741. Are they what is generally called commons, or are they used by several of the farmers around in common?—Each farmer around has a right to turn cattle on to it—bullocks, sheep, horses, and whatever he likes.

37,742. Do you consider them to be what we ordinarily mean by commons, or do you think they were enclosed lands which have come to be treated as if they were such; were they the commons of the parishes?—You see it is a large tract of land running up between many parishes; it may be 10 parishes that surround it, or 20, and they still belong to the lord of the manor. No doubt once all the farms also belonged to the lord of the manor, but they have been sold.

37,743. They agreed to take crops off them in the time of the French war?—Some of the land was tilled by the lord of the manor, and some by leaseholders.

37,744. And now they have gone back to commons again?—Yes. At one time, we will say ten years ago, when wool was at a good price, they were valuable, but now they are worth very little. There are men in that district always wanting some of the land; I mean working men.

37,745. You know the prevalent feeling is against the enclosure of commons, and that a Parliamentary Committee would have to consent before it could be done?—Yes; but here are thousands of acres lying dormant, which are worth improving.

37,746. Are you aware that there has been a great movement against the enclosing of any of these lands?—I do not think many would object to this. You can drive for 20 miles over them.

37,747. Are you aware that there is, or was, a portion of the Government, of Parliament, and of the nation, who objected to any of these things being touched?—Yes.

Sale by live weight.

37,748. About the sale by live weight you appear to agree with the honourable member who asked you the question, that it could be only the buyer who objected to the sale by live weight?—Yes, as a rule.

37,749. Did you never know farmers who had stock to sell, objecting to sell by live weight, on the ground that they would be more likely to know what was inside the animal, and the way it was packed, than the person who was buying from them?—No, it has not been much tried.

37,750. Have you found any difference between the live weight and the dead weight of animals?—It is not often we have the chance of weighing the carcase.

37,751. Have you studied it—you know it is done in France?—I have a machine of my own and I always weigh my own.

37,752. You can know what the live weight is, because there is, or ought to be, a weighbridge at every market?—In our district as yet they have not been generally erected.

37,753. You know the Act makes it necessary?—Yes.

37,754. Sir Thomas Acland's Act?—Yes, it is evaded in our district, and I do not know of one public weighbridge for cattle in the district.

37,755. (*Sir Nigel Kingscote.*) Are there many Chambers of Agriculture or Farmers' Agricultural Associations in Cornwall?—Not so many; they have gone down to a great extent.

37,756. You do not have meetings for the sake of discussing these questions?—We do occasionally, but very seldom.

37,757. Do you think what you have said here to-day would be generally acceptable as the opinion of tenant farmers in Cornwall?—Yes, I think so. We have our public dinners, of course; market dinners; where these things are discussed.

37,758. You discuss these matters, then?—Yes.

The witness withdrew.

Mr. T. Latham.

6 Dec. 1894

Mr. THOMAS LATHAM called and examined.

Mr. T. Latham.

6 Dec. 1894.

His own farms.

37,759. (*Sir Nigel Kingscote.*) I believe you are a tenant farmer, both in Berkshire and in Oxfordshire?—Yes.

37,760. I will take Berkshire first; what is your holding in that county?—I hold 516 acres in Little Wittenham and 146 in Long Wittenham.

37,761. Are those two holdings contiguous?—They adjoin, but they are not under the same landlord.

37,762. Of the 516 acres I see 120 are grass, and 396 arable?—Yes, that is as near as I could do it in a rough way.

37,763. What is the nature of those 516 acres; are they heavy?—They are divided into thirds, as I have stated in my brief.

37,764. Is one third heavy clay, with a clay subsoil?—Yes.

37,765. Is another third heavy land with a chalk subsoil?—Yes.

37,766. Is the other third loam on greensand?—Yes.

37,767. As regards the grass, is about half of it Thames meadow; one quarter top land loam, and the other quarter heavy clay?—Yes.

37,768. What was the rent in 1873?—This is a farm which has been in our family ever since 1809. The rent in 1873, which is the time I have taken my statistics from, was 840*l.*, and 276*l.* tithe, which was all paid by the tenant.

37,769. When did you come into occupation?—In 1873.

37,770. You paid 840*l.* rent, and 276*l.* tithe?—Yes.

37,771. What has been the reduction in the rent up to the present time?—I have been farming under an excellent landlord, and he has been exceedingly kind to me. It has gradually been reduced from that rent down to the present time. I had better say that I have just retaken this farm—in 1893—for 500*l.* a year, and the landlord pays the tithe.

37,772. Have you held it on a yearly tenancy, or on a lease?—I have always had it as a yearly tenancy with two years' notice.

37,773. Is that the nature of your new holding?—Yes. To that I might add that he has given up 100 acres of his woodlands to me, and the whole of the shooting, for which I pay an extra 50*l.* a year altogether.

37,774. Then in addition to the farm you have got 100 acres of woodland, and the shooting——?—Of the whole estate.

37,775. And you pay for that 50*l.* a year?—I do.

37,776. So that means you now get the whole of the farm and the woodland for 550*l.*?—Yes, tithe free.

37,777. In another parish called Long Wittenham, what do you hold?—In that parish I farm 146 acres of land. I would like to say at once to this Commission that there I am an unfortunate tenant under Jabez Spencer Balfour, and I feel very strongly about the way in which I have been treated in consequence, and I shall have more to say about that presently. That land is part of his holding. It was previously a farm belonging to my father, my brother sold it, and Mr. Balfour bought it. We have farmed that farm for 50 years. That previously was rented at about 48*s.* an acre; now my rent there is 1*l.* and no tithe.

37,778. Did you ever pay tithe there?—Never; there never was any tithe on it.

37,779. In 1873 did you pay 48*s.* an acre?—No, it was my father's at the time, but it stood in the rate books at 48*s.* an acre, as assessed by the Assessment Committee.

37,780. Now you are paying 1*l.* an acre?—Yes.

37,781. What is the nature of the soil of that farm?—All our land running by the side of the Thames is loam on the green sand.

37,782. Then you are farming in Oxfordshire?—Yes, I farm in Oxfordshire 500 acres, principally under the same man, Mr. Balfour.

37,783. Is this contiguous to the other?—It does not adjoin.

37,784. Is it close by?—It is a very little way across: it is about about a mile across.

37,785. Of that 500 acres, 120 is pasture, and 380 arable, I think?—Yes.

37,786. What is the nature of that?—That is very much the same kind of land, loam on the green sand, and a little clay under it, but not much.

37,787. What is the rent per acre?—1*l.* per acre.

37,788. Any tithe?—No tithe.

37,789. What was the rent in 1873?—That was about 46*s.* as near as I can get at it.

37,790. Then you have another farm in Oxfordshire—Bishop's Court, I think?—Dorchester, Oxon.; that is my own.

37,791. Your own freehold?—My own freehold.

37,792. What was that rated at in 1873?—As high as 58*s.* an acre.

37,793. What is it rated at now?—30*s.*

37,794. Any tithe?—Very little.

37,795. What is the nature of the soil there?—That is a very rich loam on the green sand again.

37,796. Any meadow?—Yes, there are nearly 100 acres of meadow.

37,797. Nearly a third of it Thames meadow?—Yes.

37,798. Having been so largely engaged in farming these three occupations—your own freehold, and the other two occupations—may I ask you what, in your opinion, and according to your experience, has been the effect of agricultural depression—perhaps we will take first of all, the effect upon the landlords?—I consider that the landlords have suffered to the tune of 50 per cent. at the least.

Reduction of rents.

37,799. Do you think that their rents have been reduced to that?—I am chairman of the Assessment Committee, and I have a good opportunity of telling. As far as the Wallingford Union is concerned, I think the result there is from 35 to 50 per cent.; it is more in other cases.

Diminution of tenants' capital.

37,800. What has been the effect of the depression upon tenants, have they lost their capital?—The effect upon them has been almost absolute ruin. They have been paying their rents out of capital for such a length of time, that they are very much reduced in their mode and method of farming, and in their capacity of farming.

Deterioration in cultivation.

37,801. Do you think, therefore, that the land itself has suffered any deterioration of cultivation?—Yes, very seriously. One of the most serious things we are suffering from at the present time is the deterioration of the production of the soil.

37,802. Do you think that that in your district is pretty nearly universal?—It is very universal.

Condition labourers.

37,803. What is the effect upon the labourer; has he felt it as much?—We live in a district where we have a good supply of labour. All through the best time of the year employment is very good, but all through the winter time we have a great many men who are out of employ: but I quite agree with Mr. Collins, the previous witness, that they are not very useful.

37,804. Do you think the actual labour itself has deteriorated?—No, I think where men have had good masters they are pretty good now. I wish I could think it was not the other way, but I do think the masters have deteriorated, and not the men.

37,805. Do the men earn the same wages as they used to earn?—They are earning them in such a very different way. All through the winter time in my early days, the labourers were always on piece-work, and earning much larger wages than they do at the present time; now the system is altered, all the threshing by the machine and piece-work is comparatively done away with in the winter. All through the summer, I think, the men do earn as much as they used to earn, except during the harvest month; when the machinery, generally speaking, does not give the men as good a chance of earning high wages, as they used to have.

37,806. Do you think their position is better than it was?—Their spending power is much greater.

37,807. They live more comfortably and better?—Yes.

37,808. And clothe themselves better?—Yes, certainly.

Mr. T. Latham.
6 Dec. 1894.

37,809. Educate their children better?—Yes, certainly.

37,810. And cheaper?—It does not cost them anything.

Cottage accommodation.

37,811. How is the cottage accommodation?—Most of the cottage accommodation in our district is very good. We have on two or three estates—on almost all the estates I am interested in—rather an excellent idea. We give every man with his cottage a rood of ground and the men value it very much. That, of course, does away with the idea of their having this craving for land. I have got a great difficulty in my old home at Little Wittenham to get our men to take land at all. We always give them little allotments in the spring to plant potatoes, and we do, as the last witness said, cultivate the allotment, and manure it, and do everything to it, but find the seed and plant it for them. But with their large gardens, they do not care much for the allotments.

37,812. In fact, the agricultural labourer does not want more than a plot of ground, on which to grow his potatoes and green stuff; he does not want to cultivate corn?—Certainly not, but they value this rood of ground because it is so close to them; it is attached to the cottages.

Small holdings.

37,813. Are there any small holdings about you?—Very few, and miserably done.

37,814. Do you think that the small holder cultivates his ground better than the large owner?—If you mean a small holder with just about an acre, or a little more, I think that man does do it fairly.

37,815. He is probably doing something else?—I was going to make that same remark. But when you come to the small holders of from 70 to 80 acres of land, they are not at all prosperous with us.

37,816. Are there any small holdings about you on which a man who does no other work can live and bring up his family?—Certainly, there are a few, but very few.

Decrease in agricultural population.

37,817. Has the agricultural population decreased with you?—To a very small extent. The migration has almost entirely stopped.

37,818. Do the young men go away into the towns?—Not to any great extent, but they do go to the towns.

Burdens on land.

37,819. What have you to say with regard to taxation, and the charges on land?—I think the land is made to bear taxes which are most unfair. The returns from the land have gone back from 30 to 40 per cent., but I think the taxation has increased.

37,820. You really think taxation has increased?—Yes, certainly.

37,821. Can you show us that by statistics?—I wish to be rather explicit on that point, because if you take the poor rates, the highway rates, and several things that may be fairly taken, I find that our rates in 1873——

37,822. (*Mr. Dalton.*) Which union?—In Wallingford principally—were from 5*s.* 6*d.* to 5*s.* 9*d.* in the pound, and they are now only 3*s.*

37,823. (*Sir Nigel Kingscote.*) That is a reduction?—That is a great reduction, but, on the other hand, these school expenses, and other things, are very large indeed.

37,824. Have you a school board?—No, we have not one at present, but we are threatened with one in three or four places, and every day we are expecting it to be put on.

37,825. As a matter of fact, can you give us the figures showing that you are paying more for taxes than you did 10 years ago?—No, I cannot; I have not figures by me by which I can show that.

37,826. Do you feel sure that you are?—If I take the diminished rents and all things into consideration, I find I am very seriously paying less, but if I take the taxes alone, I think we are paying more.

37,827. (*Mr. Dalton.*) But the rate in the £ has gone from 5*s.* 6*d.* down to 3*s.*?—Yes.

37,828. And I suppose your assessment has gone down too?—I ought to explain that in this union we have a very large contribution from the railways.

37,829. You get nearly one-third paid by the railways, do you not?—Our rates would be very much more, if it were not for that.

37,830 Your taxation does not all fall upon the land, for a third of it is paid by the railways?—Yes, no doubt that is so.

37,831. (*Sir Nigel Kingscote.*) What is the land tax in your district?—The land tax in our district is very high, and it is a very unfair rate. I contend that under the altered circumstances of the land, we have no business to pay a land tax at all.

Mr. T. Latham.
6 Dec. 1894.
Land tax.

37,832. You think the land ought not to pay a land tax?—I think the land has been swept of all its fair profit; and surely we cannot expect the land to pay more all the time.

Compensation for disturbance under Agricultural Holdings Act.

37,833. Now what have you to say as regards the Agricultural Holdings Act?—I am one of the members of the Committee of the Central Chamber of Agriculture which sat upon that subject, and I have expressed my views very strongly upon one particular point on which everyone does not agree with me. I have put forward that I think the strongest point in the Agricultural Holdings Act, which we want to see remedied, is the compensation for unfair disturbance. I have farmed this amount of land for a great number of years, and I always farm every acre of land I occupy, exactly as though it were my own; I always make an agreement with my landlord that I shall do so. What I mean to say is that I make a sort of agreement of my own, I enter it always as a yearly tenant, but I always have two years' notice to quit, and I farm it exactly as I like in any shape or way, and I should not be much ashamed to show my farm against almost anyone. But unfortunately for me, this gentleman I have named, Mr. Balfour, has become a bankrupt, the land has got into the hands of the official receiver, and the property has been put up for sale. They had no option, I believe, but to give me notice to quit, and I feel it very hard indeed, that having farmed this farm for a considerable number of years—I took it in the most dreadful state of repair, and I have spent thousands upon it—that I am compelled to leave it without any reasonable chance of getting any compensation for my forced removal. Almost in all agreements that I have known anything about—and I have had some experience—there is a clause put in giving landlords a call on their tenants if they go bankrupt. That is a very fair clause I am quite willing to admit, but whether the owner goes bankrupt, or whether he dies, and his family behave badly to the tenant, I think there should be some very strong clause in an Act of Parliament, that would give the tenant compensation for unfair disturbance—such disturbance as it is almost impossible for him to prejudge or foresee. If you wish the land to produce what I maintain it ought to produce, if the land is to be farmed to the very best possible extent, and the greatest possible amount is to be got out of it, tenants must be placed in that absolutely secure position, which I am sorry to say at the present time they are not.

Compensation for improvements.

37,834. That is you would give compensation for the improvement of the farm?—Certainly, I would for this very reason, there may be some cases where men may have made businesses such as large milk-walks, and all that sort of thing. I think under those circumstances it is easy to judge that sort of thing. But where a man has farmed a large tract of land, like we have at the present time, although we may fancy we have got a fair chance of recouping ourselves by this two years' notice, down comes the notice all at once upon you.

37,835. Would you compel the landlord then to give compensation or rather to purchase the goodwill, in the illustration you have given of a milk-walk, whether he liked it or not?—I think if a tenant has got together a large trade, and he is moved away, as he cannot carry that trade with him, for he may have possibly been living close to the town, and he has made a business there which he cannot take away—he should have some compensation for that; because whoever comes into the farm, in all probability would have the chance of taking up his milk-walk, that is of taking up a large business, which would be very easy to work once it is started.

37,836. And you think that ought to be done by an amendment to the Agricultural Holdings Act?—I have tried very hard indeed to get an amendment proposed to that effect.

Duties on foreign produce.

37,837. As regards foreign production do you think that it ought to contribute towards the taxation of the country?—Most certainly I do. I think it is one of the weak places in our agricultural life at the present time to walk about as we do, and see all this foreign meat in the different markets, most of it sold to our agricultural labourers at the present time as English meat, and no possible way of getting anything out of it. To illustrate what I should like to say on that point, I would

Mr. T. Latham.

6 Dec. 1894.

mention that I had the opportunity last week of going through a large bacon factory at Chippenham, where every bit of the meat is branded. I never saw anything more beautifully done in my life; and surely if our English manufactures can be branded in our own country and shown—for they are proud to show that it comes from the factory of Chippenham—it would not be such a very hard matter to brand the meat, and show where it comes from abroad.

37,838. Would you tax it as well as brand it?—I would certainly tax it as well as brand it. I would make it contribute towards this taxation which we all feel is excessive.

37,839. Would you tax products of all kinds?—Of all kinds.

37,840. Corn and grain of all sorts?—Yes.

State loans for conversion of arable land to pasture.

37,841. Going to another point, would you like to see State loans granted, so as to help the tenant, or the landlord, or both?—I am almost afraid it will very soon be a case of helping the landlord, if the depreciation goes on as it has done up to the present time. I think if the arable lands are to be turned, as they must be turned, into grass lands, and if it is to be for the benefit of the country generally—it certainly will not be at the onset for the benefit of the individuals—there should be somebody in the country to start these things.

37,842. Do you think that is the only hope for the agricultural community to turn all arable lands into pasture?—Certainly; every acre of corn grown at the present time is grown at a loss.

37,843. Is there not a great deal of land that will hardly turn into pasture?—I think that is quite right. I think there is a certain amount of land at the present time—and I have some which I have probably described—that is purely wheat-growing land, and nothing else; but where you can only grow wheat at a loss you must give it up. Every acre of wheat that I have grown the last two or three years I have lost money on.

37,844. Would you grant State loans to enable landlords and tenants to carry this out?—Yes, we cannot work this separately. I should like to state that I have been very much interested the last few years in the work of the dairy schools under the technical education scheme. We have now got hundreds of young ladies perfectly competent to make butter, and in many instances to make cheese, and if we could get factories started it would be another means perhaps of holding the industry together.

Compensation for unfair disturbance.

37,845. (*Mr. Chaplin.*) I just want to ask you one or two questions with regard to the point that you raised so strongly about compensation for unfair disturbance. You hold that opinion I suppose very strongly, after what has occurred in connexion with Mr. Jabez Balfour's farm?—Yes; but it is an opinion I held for many years before it was so well applied to myself.

37,846. But probably that has had the effect of opening your eyes?—That has opened my eyes very much indeed. I thought the man a millionaire one day, and he was a bankrupt the next.

37,847. What agreement did you hold under?—None.

37,848. I mean on what terms did you hold this farm of Mr. Jabez Balfour; did you hold it under the Agricultural Holdings Act?—No; I never have any agreement. I farm exactly as I like until the last two years when one or the other gives notice. Then I am tied down to the five-year course; but up till then I sell everything I can, and I treat it exactly as my own.

37,849. Do you say that you get no compensation on leaving?—No; nothing.

37,850. Surely you could claim it under the Act?—Of course that is a legal question, and I do not wish to give an opinion on it.

37,851. But it makes it rather important, because I suppose you would hardly hold the same strong view about compensation for disturbance if full compensation for all your improvements was assured to you?—You know—for we sat on the same committee—that I expressed the same opinion then that I express now, that under the conditions under which I hold all my land—I take it, as I have said, from my landlord at a yearly tenancy with two years' notice—I have no restrictions in buying or selling or farming in any shape or way. But the moment he gives me notice or I give him notice, we are bound to a five years' course as to how I am to leave; and I am rather afraid, although I am not a lawyer, that I have not much hope or help from the Agricultural Holdings Act.

Mr. T. Latham.

6 Dec. 1894.

37,852. That would not be my opinion according to my reading of the Act. I am under the impression that unless you have a substituted agreement giving an equivalent compensation you could get all the compensation that the Act provides; but you are not sure upon that point?—I am not sure of it, and I think our chairman, Mr. Lipscomb, said to you at the time we were discussing this, "I have a sort of model for myself."

37,853. You have never taken a legal opinion?—No, I have not taken a legal opinion, but I shall before I leave.

Compensation for high farming.

37,854. If you ascertain that you are by the existing law assured full compensation—and I apprehend in your case with a farm in the condition that yours is in you would not be likely to suffer much from a counterclaim—if that were so would that modify your view as regards the other point?—No, I think not, because we inserted a clause, if you recollect, that we should have fuller compensation for continuous good farming; and that is not the law at the present day.

37,855. That is held, I believe, to be rather a moot point?—I say I am not a lawyer, and I do not profess to interpret the Act.

Compensation for improvements and disturbance.

37,856. I want to have one thing quite cleared up; you have put before the Commission that a farmer might have created a business like a milk-walk, and that he should be compensated for it upon leaving, because the next tenant would probably succeed to his business?—Why I made that remark was that I feel very strongly that we must convert a great deal of this arable land into pasture, and that if we endeavour to teach the whole of the population to make butter and milk in the way that I mentioned just now the Technical Education Scheme has been carried out in our two counties, and if a man turns a great deal of his attention to that sort of thing and starts a large milk-walk close to him, which makes his farm more valuable, then I think he is creating an industry for which he is entitled to full compensation if he is capriciously disturbed.

37,857. I can quite understand that it might be more valuable as long as the farmer, who was a good man of business, and who had created it, remained there; but it might be possible that his successor was incapable of conducting the business in a profitable manner; would it not be rather hard, under those circumstances, to compel the landlord to pay compensation for a business which was no longer profitable; does that not strike you as being rather a difficulty?—I agree. I think we agreed on this committee that there was a difficulty on this particular point. But if we are to encourage farmers to do the very best they can by their country, to get the greatest amount of gain out of the soil, they must have some sort of security for their knowledge, and their brains, and their money, and their industry, or else I think we must, under the altered circumstances of the case, give it up.

37,858. From what you have told the Commission it is quite evident that you spend a great deal of money on your farms and that you put a great deal of capital into them without any legal agreement giving you compensation as far as you are aware; and I can quite understand that under those circumstances you naturally expect to have some means of getting compensation?—Yes, of course.

37,859. That you propose to get by this system of compensation for disturbance; but what I want to arrive at is this: If you were assured that under the existing law, or under any amendment of the law, you would get full compensation for all your outlay, the benefit of which you have been deprived of reaping, would that not be sufficient, in your estimation, to meet the difficulty?—Not exactly so, I think. The different amended clauses we have sent up to this Commission will show that we have made several additions; but this particular point does not form a part of our recommendations. We were in a minority in the committee. But I feel very strongly on the point, and I always thought that if I came here I would mention it again. If the whole of the recommendations of the committee were adopted by Parliament I am not so sure that I should be so strong on this particular point.

37,860. That is exactly what I am trying to arrive at—that if you could be assured that under an amended

Mr. T. Latham.
6 Dec. 1894.

law you would get full and fair compensation for all your outlay, then you would not attach so much importance to getting compensation in this particular way as compensation for disturbance. In fact, the one would to some extent take the place of the other?—The wording of our committee's suggested amendment is so very different to the wording of the Act, that I do think that it removes a difficulty under which at the present time I feel placed.

Effect of abandonment of wheat growing.

37,861. With regard to what you told us just now, that every acre of corn was grown at a loss on your own farm, and that on your own farm you had a certain amount of land that would grow wheat and nothing else, if you are obliged to abandon the wheat growing what will happen to that land?—I think it must go down to its natural state.

37,862. And become practically worthless?—Yes.

Land out of cultivation and unoccupied.

37,863. And cease to employ any labour?—Certainly. There was just one question that was not put to me when I began, and that is about the altered position since 1873, and its effect upon agriculture. I am afraid that we are getting a very large quantity of land that is coming to that sort of thing in Berkshire. I speak for North Berks and South Oxon pretty much. Some of our North Berkshire lands are continuous to the Ilsley Downs, and is land not easily cultivated, and lies a long way from different railway stations. I think virtually—and before very long—it will become absolutely useless.

37,864. (*Sir Nigel Kingscote.*) I suppose that is land that was broken up some 30 years ago?—It is land that you know of in going down to Lambourne to the small holdings there. It is land of very small value, and I think you know a little bit about it yourself. I am afraid the altered position of the landlord in those districts will be very severe, and that there will be a very large amount of that land not cultivated; indeed it is not cultivated now.

37,865. (*Mr. Chaplin.*) If things continue as they are doing at present you are apprehensive that there will be a very large extent of land of this description?—Very.

37,866. When you say that, can you give us any rough idea of it at all; in Essex, for instance, we hear that there are 60,000 acres of land in one district in that condition?—I am not prepared to give statistics on which I should like to speak without being more perfect; but, still, I know there is a very large quantity of this land which is falling into the owners' hands, and I know very well that it cannot be occupied and will not be occupied.

37,867. That is, I suppose, entirely owing to the low price of the produce?—It is entirely owing to the low return from the soil. At the most these lands could only be down lands if they could be turned back into pastures. They are large wild ranges; they are a very long way from a railway station, very hilly and bad of access. I think it is a most serious thing for our part of the country.

37,868. In prosperous times what did that class of land grow. Was it used for sheep farms?—This kind of land has produced some of the very best sheep in the county. I do not think there is another fair in England where such good sheep, and such a large number of sheep, are turned into money as at the Ilsley fair.

37,869. Would it grow first-rate turnips?—Yes, and very fair barley and some wheat—seven sacks of wheat.

37,870. Good malting barley?—Not what you would term good, useful barley.

37,871. At all events, it grew first-rate turnips, sheep, fair barley, and wheat too?—Yes.

37,872. And all that class of land which at a certain price for the produce produced those articles you have named, and employed a great quantity of labour, in your estimation is going to become absolutely useless?—Perfectly so, beyond any doubt.

37,873. The only thing, I gather, to remedy that is some improvement in the prices of the produce?—That is virtually the only answer I can give, that we must have a better return from the soil.

Changes in system of cultivation.

37,874. (*Mr. Everett.*) I understand you have been farming good land with unlimited capital and wide liberty of action; have you been able to find methods which, in your judgment, have been better than the ordinary methods of the districts in which your farms are?—No, certainly not.

37,875. You have not been able to find other courses of cropping which are substantially better?—I would like to say that I have grown potatoes very largely where corn has been grown previously. I handed all my returns in to the assistant commissioner that we had down to us, and I hardly took them so carefully out for coming before you. I began growing potatoes in 1882, and my first return was about 11*l.* an acre, when the corn was making 9*l.* I have worked it up to 18*l.*, 20*l.*, 21*l.*, 18*l.*, and 21*l.* an acre in successive years. Of course, last year was a very bad year for potatoes, and they went back to 12*l.* again; I think they will make about 16*l.* an acre this year. Last year was the worst year almost that we ever knew, and this year is inclined to be rather a dear year for potatoes, as we cannot all grow potatoes, that is certain. Indeed, this very land, that I have been speaking of before, is not potato land at all; it would not cultivate potatoes at all.

Assessments to local rates.

37,876. (*Mr. Dalton.*) When your rent is reduced do you get a reduction in the assessment?—Yes, certainly.

37,877. Do you go by rent in the Wallingford Union to a great extent?—We go by rent in this way—if we find farms held from father to son in favourable circumstances, we do not take that sort of thing as a guide; but as a rule we make the rent our basis.

37,878. I think in 1873 your rates in the Wallingford Union were 5*s.* 6*d.* in the £?—I think that was it.

37,879. Can you give the precise figures now?—I went through them last evening, and I think they are just over half-a-crown.

37,880. Which is the heaviest, the poor rate, the highway rate, or the county rate?—The poor rate covers everything with us.

37,881. Are you sure that it is as high as half-a-crown?—Yes, but the poor rate covers everything—that includes highway rate, county rate, and everything.

37,882. The school board rate?—We have no school boards, we are threatened with them.

37,883. Is it exactly 2*s.* 6*d.* a year?—I think it is just over 2*s.* 6*d.*, but it is under 2*s.* 9*d.*

37,884. It has gone down from 5*s.* 6*d.* to 2*s.* 6*d.*?—Yes.

37,885. Your assessment has also gone down very considerably, I presume?—Yes, something wonderful.

37,886. Therefore you must be paying less than a fourth of the rates now that you were. Supposing your assessment has gone down one-half and the rate in the £ has gone down more than one-half, you must be paying in rates for your farm about a fourth of what you were formerly paying?—I am also a member of the Berkshire County Council since they commenced, and we speak very highly of the County Council work. We reckon (and I do not mind how widely this is known) that we have saved the ratepayers of our county as nearly as possible 6*d.* in the £ since the Council has been started. Of course, that helps us very considerably when we speak of it all coming through the poor rate. We have about 12,000*l.* a year for our union officers; we pay about 20,000*l.* a year towards the main roads, all out of these rates, and altogether Berkshire is one of the counties which is perfectly well satisfied with the financial administration of the Council.

37,887. But the result has been that you pay about a fourth for rates of what you did in 1873?—I know our rates are very much diminished in that way. When I speak of the unfair taxation and charges on the land I mean that we have got so many men who live on the land who pay nothing whatever towards it.

Traction engines and maintenance of roads.

37,888. What kind of men are they?—The brewers to begin with. I know my friend, Mr. Little, will forgive me for speaking of this matter, but the first time I met him I was very sore against the brewers, who use our roads very seriously, and do not contribute a penny piece towards them. What is more iniquitous to my mind is that we have at certain periods of the year—we have had a great deal of trouble over it this year—round-abouts and traction engines running over the roads, which never pay one penny piece towards the roads. We had a system in our county which I have just got altered, that if the traction engine were a light-power engine we would charge nothing on that, but we have now put a small 3*l.* license on.

37,889. You have the power to put a license on these engines, have you not?—Yes. These sort of men are ruining us. We have kept our roads up very excellently at the present time, and I believe they will make

Mr. T. Latham.

6 Dec. 1894.

a very serious difference to the depreciation of the road. They have no right, to my mind, to be there without paying. These men earn no end of money. One of these traction engines will draw eight coaches and another seven; they draw them to our different fairs and they take 100*l.* a night out of our working classes, and they do not pay one single penny piece towards the taxation for the roads.

37,890. Still you can charge them for a license?—A very small sum.

37,891. You do not charge up to the amount that you may?—No. Our license is 10*l.*, and they make out that they cannot pay that. The brewers take an enormous quantity of beer round the villages, and they use the roads as much as anyone possibly can. It is the same with the millers. I do think there should be some alteration in the law here.

Assessments of railways to local rates.

37,892. You have no complaint to make of the railways, have you?—Yes, I have very great complaint of the railways.

37,893. I mean as to their contributions to the rates?—They cannot help themselves.

37,894. They pay nearly a third of the rates in your union?—Yes. I should like to have an opportunity of saying a good deal on the railway rates, but as time presses I will waive that.

37,895. Do you think that they pay their full share towards the local rates?—We try very hard to make them on our Assessment Committee.

37,896. How have you managed to get their assessment so high; did you have to fight them?—I must say no. We have always gone on our own valuations up to two years ago, when we thought it prudent to employ a firm of London valuers—Messrs. Castle, I think—and they increased it very much indeed. Now we are just going on the double system.

37,897. Did the railway assent, or did you have to go to law?—They have always assented; we have never had any difficulty with them whatever.

37,898. Then they are not over assessed at the present time, I should suppose?—I should take that certainly for granted.

Land Tax.

37,899. What is the land tax in your union?—It is very high. I cannot possibly tell you what it is, but we feel it to be a sore grievance.

Tithe rent-charge.

37,900. Is the tithe high too?—The tithe is very high so high that I can assure you, gentlemen, I own tithe in my own parish at the present minute which is 15*s.* an acre.

37,901. (*Mr. Little.*) Now?—Now.

37,902. Is it possible?—Yes, I am speaking of the commutation.

37,903. (*Mr. Dalton.*) Is it 15*s.* by the commutation?—Twenty-five per cent. of that.

37,904. It would be nearly 11*s.* then; what is the rent?—The rent is 30*s.* an acre; that is part of my own farm.

37,905. What is the land tax?—I cannot possibly tell you.

37,906. The tithe and the land tax are evidently very much more serious in your district than the local rates?—Land tax was felt a very great grievance for many years, I know, but I could not answer the question off-hand.

37,907. Your total local rates are only 2*s.* 6*d.* in the £ now?—We do not complain of our local rates at all. By judicious management in our union, we have reduced our assessment to something like 82,000*l.* in the last 20 years.

37,908. The burdens really that are pressing upon the land in your district are the tithe and the land tax?—I have no doubt about that.

37,909. (*Lord Rendel.*) In 1873, on your Berkshire farm of 516 acres I think you said the tithe was 276*l.*?—Yes, that was not the commutation. It was just about 25 per cent. over then, or something like that, for it was very seriously over par then.

37,910. (*Mr. Little.*) That is under 15*s.*, of course, but it may not be all titheable?—That did not apply to that particular land, the 15*s.* an acre is for Dorchester.

Assessment to local rates.

37,911. You said just now that you did not complain of the local rates, but I understood you before to object to the principle of levying these local rates upon land and real property only?—So I do very much indeed.

37,912. You do not base that objection on the ground that the rates have increased?—No.

Mr. T. Latham.

6 Dec. 1894.

37,913. But that they are unfair?—Unfair.

37,914. They have decreased very much with you but perhaps you would consider your union a very special one?—Yes.

37,915. A very exceptional one?—I should, because we have only got to go across the border where I think they are pretty nearly 6*s.* in the £.

37,916. (*Mr. Dalton.*) Are you referring to a rural parish?—Yes; I think you will find Henley is between 5*s.* and 6*s.* in the £.

37,917. You mean the urban rates, not Henley district—Henley is a borough?—No, I mean the Henley rural district. I happen to have very good means of knowing.

37,918. (*Mr. Little.*) The large development of the railway has relieved your land very considerably?—Yes.

37,919. In rural parishes generally there would be no such assistance would there?—The rates are gone down; you cannot get away from that fact.

Position of agricultural labourer.

37,920. I presume that the position of the agricultural labourer has improved, and that that naturally would account for a decrease in the rates?—Yes.

37,921. If the farmer pays as much for labour as ever he did, and the money that he pays enables the labourer to live in greater comfort, and he does not become so pauperised, the farmer is quite entitled to any reduction of rates that may come to him from that cause?—Certainly; where there is no out-door relief there is not much pauperism.

Contributions to cost of maintenance of roads.

37,922. When I first saw you—you have alluded to that time—you were smarting under a grievance arising from the abolition of the turnpike tolls?—Yes.

37,923. That had placed upon you a very heavy charge?—Very.

37,924. That grievance has been removed by the main road system, has it not?—Yes.

37,925. You, individually, have been relieved of the burden by making the main roads a charge upon the county and by getting a subvention from the Government?—Yes.

37,926. Still you complain of the injustice of those who use the roads so much not contributing to the cost of maintenance?—Yes. Only about the night before last I think we had seven bakers' carts come from the towns around into our little village where we have four bakers baking. Now, those men do not contribute one penny piece towards our roads, though they run over every inch of them.

Compensation for high farming.

37,927. Upon the subject that Mr. Chaplin was asking you about, namely continuous good farming, have you studied the Agricultural Holdings Act?—So well that I could almost repeat it a little while ago.

37,928. Do you find in it any limit of time as to which compensation should be restricted?—I think it has gone very much to two years.

37,929. Is there in the Act itself anything which would prevent an arbitrator, or a referee or an umpire from giving compensation for continuous good farming?—I almost think I must say yes, but I am not clear on the point, I know that it is a disputed point.

37,930. Is not the only limitation of time with regard to a landlord's claim in respect of waste?—Are you talking of the counter-claim?

37,931. Yes, he cannot go back further than four years?—That is so.

37,932. Is there any limit of time with regard to tenants? I am not speaking about improvements under the first and second parts, which are by consent?—You are speaking of the compensation for manures?

37,933. Yes?—Two years, I believe it is.

37,934. I am not aware of it?—I have known instances where the valuers have rather gone behind the Act to give a little more for continuous good farming.

Compensation for disturbance.

37,935. (*Mr. Clay.*) Regarding the amenity, you consider that if you were put out of a farm you should get some allowance?—Yes.

37,936. The reason is that you have really built up a business and you have made it into a position that has given it value?—Yes.

Mr. T. Latham. 6 Dec. 1894.

37,937. And whoever comes after you will profit by the industry and intelligence with which you have increased the value thereof, but which the Act does not recognise?—Yes.

37,938. So you think that you should really, like other persons have the good-will allowed you?—Yes.

37,939. That is what you would call the amenity?—Yes.

Mr. T. Latham. 6 Dec. 1894.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Sixty-ninth Day.

Friday, 7th December 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., Alan Mackinnon, Esq., *Assistant Secretaries.*

Mr. Thomas Henry Elliott recalled and further examined.

(For previous evidence *see* page 100.)

Mr. T. H. Elliott. 7 Dec. 1894.

37,940. (*Mr. Chaplin*). When you were describing the work of the Intelligence Department of the Board to us, you told us that you require better information on all agricultural matters, both at home and abroad; is that so?—Yes, that undoubtedly is the case.

37,941. I should like to ask you some questions with regard to agricultural matters at home first; there, I understand you to say that at present you have a very insufficient connection with, or knowledge of, the current position of agriculture?—Yes, that is the case.

Local agricultural correspondents.

37,942. If I understood you aright what you rather wish for, what you look forward to is having correspondents in each locality?—Yes, we should like to have agricultural correspondents in each locality from whom we could receive periodical information as to the position and prospects in the localities.

37,943. I asked you some questions the other day about the inspectors under the department who are attached to the Board in a certain way. It is the case with regard to those inspectors, I understand, that they are all of them more or less eminent in agriculture, and among the foremost agriculturists in each county, are they not?—Yes, that is so; they form an exceedingly valuable, but at the same time a limited, body of referees.

37,944. What alteration would be required to make these inspectors thoroughly effective for the purpose that you have in view?—I scarcely think the present inspectors would be able to act in quite the manner that we would wish, except at a very considerable cost; but we should certainly use them for some purposes. The essence of any arrangement would be that we should come to a distinct understanding with them that they were to act permanently in carrying out the instructions that we should give them; and that, of course, would mean the payment of a permanent retaining fee.

37,945. On the assumption that you were able to make a satisfactory arrangement with these different gentlemen, do I understand that probably, in your opinion, they would be very effective instruments for carrying out your object?—Yes, but I do not think there would be enough of them. I think they would form the nucleus of the staff of agents and representatives that we look forward to possessing.

37,946. You would require a greater number of local correspondents than you have in these inspectors?—Yes, I think we should require a greater number of correspondents than we have in these inspectors, and I think it would be desirable also that we should endeavour to increase the number of classes from which they are drawn.

37,947. Could you tell us anything further as to the way in which you propose to bring yourself directly in touch with every district in the country?—If we could secure representatives and correspondents of different classes in every locality in the country then I should hope that as a further step we should eventually be able to make them a link between us and the various agricultural societies and farmers' clubs. I look upon these agents as forming part of a wider organisation of the agricultural industry generally.

37,948. Your inspectors are at present, I think, taken chiefly from the class of agents and farmers?—Chiefly from the class of agents, and in some cases they are farmers of great ability and repute.

37,949. They are all of them practical men and have a practical knowledge of farming?—Undoubtedly they all of them have a practical knowledge of farming.

37,950. And a great number of them are actually tenant farmers?—I do not know the number at the moment, but some of them are tenant farmers themselves.

37,951. From what class do you propose to add to your correspondents?—I think we should want more of all classes. The present number is comparatively limited.

Land out of cultivation.

37,952. I asked you some questions the other day about land out of cultivation, and the best means of getting information about it. On that point I should like to ask you this question: Assuming that we arrive at a satisfactory definition of what is meant by land out of cultivation, would not your present inspectors, about whom we have been speaking, be just the persons who could supply us with the information required if we apply direct to them?—I should hardly like to say "Yes" absolutely to that question, because so much depends upon the information that is required. If the collection of the information involved the collection of returns from individual occupiers then I should scarcely think that the employment of those inspectors would be the best way of doing the work; but as to the conditions of agriculture in the country undoubtedly they form a very valuable means of obtaining any general opinion.

37,953. For the purpose of getting at the broad facts?—For the purpose of getting at the broad facts.

Mr. T. H. Elliott.

7 Dec. 1894.

Staff of intelligence branch.

37,954. Now with regard to foreign information, I think you told us that you receive a good deal of information already?—We receive a good deal of information already. We have a certain number of newspapers, we obtain a certain number of official publications, and we receive from time to time a certain limited number of consular reports and of reports by our diplomatic representatives abroad. But we do not feel that we are yet in possession of anything like the information as to the position and procedure in agricultural matters abroad which we ought to have.

37,955. With regard to what you do receive, is it submitted at once to examination in the Department?—It should be, but the staff of the branch is so extremely limited that it is a matter of physical impossibility that everything should be examined as fully and promptly as it ought to be examined. Undoubtedly for the proper performance of the work we require a larger staff in our Intelligence Branch.

37,956. Then with regard to the information that you receive already (I will come to the wider information that you express a desire to have later) what is required in the Board, what do you want to place the Board on a proper footing in that respect?—That is a question very much affecting our higher clerical establishment. At the present moment we are not in a position to examine as promptly and as fully as we should like the information—the publications and the other printed matter—that we do receive. We are a new department, but we hope before very long to fill up the gaps and deficiencies which exist.

37,957. It comes to this, I think from what you tell us that the staff you have is not adequate at present to enable you to turn to the best account the information you already receive?—That is so.

Agricultural attachés in foreign countries.

37,958. Then I think you told Mr. Giffen that you thought there should be a special representative of the Board abroad in certain countries; what countries should you specify?—I should hardly like to propound any very large and elaborate scheme of the kind as one to be adopted off hand. If we were actually making proposals to the Treasury, we should prefer to make an experiment in regard to one country, and possibly for a limited period, so that we might see whether we really obtained value for our money and secured information useful to agriculturists.

37,959. In making that experiment what position do you contemplate he would occupy; would he be responsible to the Foreign Office or responsible to your Department?—That is a matter for consideration between the Foreign Office, the Treasury, and ourselves. It might be desirable, for the sake of uniformity and for the sake of consistency with our other arrangements, that he should be responsible to the Foreign Office. But I have no doubt that any matter of form of that kind could be settled satisfactorily between the departments concerned. I should not like to say without consultation with other departments that it would be desirable that he should be directly responsible to us. There may be matters of official form to consider, but I do not think they would present any great difficulty.

37,960. What you want to do is to try the experiment of having an accredited agricultural representative in some foreign country?—That is the case.

37,961. The agricultural departments of various foreign countries, and of some of our colonies, I think, are already represented in this country, are they not, by accredited representatives?—Yes. There has certainly been a gradual development of special representation abroad in the case of other countries.

37,962. Can you tell us which countries they are?—The countries which are known to have official agricultural representatives abroad are France, Italy, Denmark, Norway, and the United States. To that list, which was prepared a few days ago, I may now add Germany, because it is announced to-day that the German Government have arranged for the appointment of five expert representatives in different important capitals. Victoria and New Zealand amongst our colonies have also appointed special agricultural agents in Great Britain.

Cost of Agricultural Department.

37,963. I will ask you for further information on that point directly, but before then I want to put to you just one or two questions about the general organisation and equipment of the Agricultural Department in England as compared with the department in foreign countries. In the first place, what is the annual cost of our department here?—The actual annual cost of the organisation may be taken roughly at about 50,000*l.*, but there are some deductions. I am speaking now from memory, but I think the nett cost is 46,000*l.*

37,964. A large part of that amount, I think, was already expended in other departments before the Board of Agriculture was created?—Yes; the actual increase of cost due to the creation of the Board of Agriculture, and apart from the special funds provided for cattle disease purposes, is very small indeed. I have not figures with me, but I could put before the Commission figures showing how very small the increased charge is; it is scarcely worth speaking about.

Mr. T. H. Elliott.

7 Dec. 1894

37,965. But there has been some additional expense in connection with cattle diseases?—Yes, a considerable expenditure in connection with cattle diseases, that is, with pleuro-pneumonia, foot and mouth disease, and swine fever.

37,966. While we are on that subject may I ask if you have any further information about the foot-and-mouth disease outbreaks that have recently occurred?—I am happy to say that before coming here to-day I signed orders releasing from restrictions all the counties upon which we imposed restrictions, with the exception of a very limited area in the immediate vicinity of the outbreaks. Practically, we may say that foot-and-mouth disease no longer exists in this country.

Cost of Agricultural Departments in England and other countries compared.

37,967. How does the cost of the English Agricultural Department compare with the cost of other countries; we will take the United States to begin with?—The cost of the English Agricultural Department is very much less than the cost of the department in the United States.

37,968. Do you know what it amounts to in the United States?—I have not the figures before me, but the difference is very substantial. At the same time there may be points in regard to which the comparison between the two departments would fail, or which would render a comparison between the two departments difficult.

37,969. Is that generally the case with regard to the other countries that you have mentioned?—So far as my information goes. It is nearly always the case that the expenditure in our Department is considerably less than it is in foreign countries. But then, of course, the policy of foreign countries with regard to State assistance of any industry may differ very considerably from our own. I should scarcely like to be regarded as expressing the opinion that our expenditure ought to be brought up to the level of the expenditure of foreign countries.

37,970. The whole organisation and equipment is on a very much greater scale than anything we have ever thought of attempting here, is it not?—In many of the leading foreign countries that is undoubtedly the case.

37,971. Are you acquainted at all with the Agricultural Department in Hungary, for instance?—I have seen certain information with reference to the Agricultural Department in Hungary which makes me envious.

37,972. I think the Director of your Intelligence Division has had opportunities of acquiring a good deal of information on that subject, has he not?—Yes.

Appointment of agricultural attachés by foreign governments.

37,973. Now with regard to the representatives from foreign countries accredited to Great Britain, could you tell us anything further about them. What is the case, for instance, with France?—In the case of France a technical agricultural attaché was appointed to the French Embassy at Berlin on a Decree dated 8th March 1893. The gentleman appointed to that post was an agricultural engineer, and was formerly an officer in the Ministry of Agriculture.

37,974. I understand that representatives to foreign countries have been appointed by the Italian Ministry of Agriculture, is that not so?—Yes, they have appointed, as we understand, five technical representatives, to Switzerland, Bavaria, Berlin, London, and Buenos Ayres. Of course the wine industry is one of the most important industries in Italy, and the duties of these attachés are mainly connected with the development of that industry; but at the same time they are instructed to keep the Minister of Agriculture informed on all matters connected with his department.

37,975. What is the case with regard to Denmark?—In the case of Denmark there is no special agricultural department. The work of that department, so far as it exists, is in the Ministry of the Interior. But in 1888 two consulting agricultural experts were appointed by the ministry and stationed at London and Newcastle, and another has since been appointed to Hamburg. The duties of those gentlemen are given in detail in the official reports of the Danish Ministry of the Interior, and I could put in a translation of the certificate of the appointment of one of them as dairy expert.

37,976. You are speaking now of the duties of those gentlemen appointed to foreign countries?—Yes. Speaking

Mr. T. H. Elliott.
7 Dec. 1894.

very generally their duty is to promote by all legitimate means the sale of Danish agricultural products in this country, and, so far as our communications with Mr. Faber, the dairy expert, go, I should say that he certainly keeps those interests well in view.

37,977. You will put in particulars, will you, an official statement with regard to the duties of these gentlemen?—Yes, I will put in a translation of the instructions given them. (*See* Appendix VIII.) If I may refer to one point in connection with my evidence of last week, I would say that one of the instructions is that the expert must have no direct or indirect personal interest in the sale of Danish agricultural and dairy products. That condition we regard as a very vital and essential one.

37,978. It is also an instruction, I think, is it not, that they are to be very carefully on the watch for fraudulent practices which may injure the reputation of Danish butter, or for cases of the fraudulent use of the name "Danish"?—Yes, that is the case.

Government aid to dairying in Denmark.

37,979. Denmark has done a great deal, has it not, to foster the butter industry at home?—Very much indeed.

37,980. In addition to what she is doing by this system of accredited representatives?—Yes, she is doing all that she can to develop the Danish butter industry, both by action at home, and, as we know, by action abroad.

37,981. Can you give us any information as to what they do to encourage it at home?—I have not with me specific information on the point, but I should be very glad to put in a memorandum on the subject.

37,982. They offer great facilities, I suppose, for dairy education?—I think so; their work is in that respect greatly in advance of our own. It is in the practical field, I think, that the Danish Government have especially been active.

37,983. (*Chairman.*) It does not give bounties for the production of butter?—I have no direct information as to bounties, but the Board of Trade could give an authoritative answer to that.

37,984. (*Mr. Chaplin.*) Could you supply us with full information as to all the means and methods employed by the Danish Government for encouraging dairy farming?—Yes, we should be very glad to put in a memorandum on the subject. (*See* Appendix VIII.) I would have prepared information upon that point, but I understood the Commission had before them a Blue Book, in which full details obtained through the Foreign Office, were given as to each country.

37,985. To go back for a moment to the accredited representatives abroad, I understand that one of the duties of these experts is this, that they will be required to answer inquiries concerning agricultural and dairy matters which may be addressed to them by institutions or private persons in Denmark?—Yes, that is one of the duties of the Danish agent.

37,986. If we had representatives abroad, are you not of opinion that that might be a matter of the greatest benefit and advantage to agriculturalists in this country if they could apply to them for information?—Seeing that we are an importing country rather than an exporting country, I rather doubt whether many direct communications to the representatives abroad would be made, but what I apprehend would be the case would be that producers at home would address inquiries to us, and those inquiries we should be better able to answer, if we had the means of reference to an expert agricultural representative abroad.

37,987. Is it to their general system, and the aid and assistance of the Government that you attribute in the main the great success that Denmark has had in dairy production?—All the information that I have received goes to show that the action of the Danish Government has been of benefit to the dairy interests in that country.

37,988. I imagine, then, it is quite possible that there may be something, or perhaps a good deal, in their system that we might copy and adopt in this country with advantage?—Of course, as I said, the conditions of the two countries are not quite the same. In the case of Denmark their business is to foster a home production, a great portion of which is exported. Our business would rather be to supply to producers at home information with regard to the methods and the course of production abroad.

37,989. Is it not the case with regard to Danish dairy produce that the greater part of it is of a very high class, the quality being extremely good?—Yes, the reputation of Danish dairy butter has been very much augmented in recent years.

37,990. Is there anything whatever in the climate or soil of this country to prevent English farmers with the same advantages for education, and the same Government assistance, from making just as good dairy products, and competing perfectly successfully with Denmark?—Persons practically acquainted with the industry could give a much more authoritative opinion on that point than I could possibly do, but undoubtedly that is our impression, gathered, of course, from the direct and indirect information which we have received.

Mr. T. H. Elliott.
7 Dec. 1894.

37,991. That would be the general view entertained in the Board of Agriculture?—Yes, but an opinion upon a question of that kind could be expressed with much greater force by those who have a practical knowledge, and who are practically engaged in the industry.

Position of agriculture in the United States.

37,992. Now with regard to the position of agriculture generally, in foreign countries, I should like to ask you one or two questions with regard to the United States to begin with. Have you any information in the Board of Agriculture as to the general condition of agriculture, and of farmers in the United States?—We have no official information except that contained in a recent report by a Committee of the Senate in 1893, which I believe is already in the possession of the Commission. We can give certain statistical tables as to the production in recent years and as to the quantities of live stock in the country; but I take it that the Commission wish to receive information summarising generally the condition of agriculture in the United States rather than purely statistical information, and that is a matter which to us, as organised at present, presents very great difficulty.

37,993. The report of the Sub-Committee of the Senate to which you refer, I suppose, has been examined by the Board?—It has been perused in the Intelligence Branch.

37,994. Have you endeavoured to acquire any information confirming it, or otherwise?—No, we have not felt it possible with our present organisation to do that; but undoubtedly there are points upon which, if we were able, we should like to obtain further particulars.

37,995. Can you suggest any means by which further information upon that subject can be obtained?—One means would be the appointment of an Assistant Commissioner, following the precedent of the Richmond Commission, to obtain information on the spot; and it would be easy to prepare a more or less useful memorandum, summarising the matter contained in the report to which I have referred and in the statistical tables.

37,996. I am asking the question because we have had some rather conflicting evidence given before this Commission with regard to the position of the farmers in America. Have you seen the evidence which was given to this Commission by Mr. Atkinson?—I am sorry to say that I have not done more than glance at it. I know that evidence was given by Mr. Atkinson, and that there has been some doubt as to whether something was not to be said on the other side of many of the matters to which he referred. But the Board could hardly undertake, with the means at present at their disposal, to arbitrate between the conflicting witnesses.

Cost of growing wheat in the United States.

37,997. Can you give us any information as to what the cost of growing wheat is there?—There is some information on that subject in the report of the Committee of the Senate.

37,998. Can you give us any information of the price at which wheat from the United States can be landed in this country at a profit?—We cannot make any authoritative statement on that point. Any evidence of that kind must rest mainly upon the authority of the individual by whom the information is obtained.

Future of wheat growing in the United States.

37,999. Then you cannot tell us, I suppose, anything as to the probable future of wheat-growing there, whether it is likely to increase or to decrease?—No, I think it would be very undesirable that we should attempt to forecast the future. We should be very glad to be in a position to issue to the public reports of disinterested and competent experts, but we cannot hope, I think, to do more than that.

38,000. In fact the Board of Agriculture is not in a position to give either information or advice to English farmers with regard to the probable competition they may expect in the future from America in wheat growing?—At the present moment I think the answer to that must be in the negative. I do not consider that we ought to put forward official prophecies as to the future of wheat-growing; but I see no objection, if it were possible, to our from time to time commissioning experts upon whom we could rely, and placing the reports of those experts, on the individual authority of the experts, before the agricultural public; but I do not think we could do more than that.

Mr. T. H. Elliott 7 Dec. 1894.

38,001. If you had accredited representatives, such as those you have suggested in the United States at the present moment, I apprehend that on some of these points which I have raised, you would be in a position to give us a great deal more information which might be of great value and use than you are able to give us at present?—Yes, that is so. All that I wished to say was that the information must necessarily depend upon and rest upon the individual, that there can be no examination and scrutiny of that information, so as to give it the full official character that many of the reports of the Department have.

38,002. (*Chairman.*) Do I understand you to mean by that, that even if you had these accredited agents you would not think it right on the part of the Department to make any prophecy as to the future of agriculture?—Not as a Department. We should put the agricultural public in full possession of the information we obtained; but we should endeavour to avoid giving it a full official impress, as it were.

38,003. You would not undertake to give official sanction to any prophecies which are made by these agents?—No, we should simply say: this is our representative; he has been asked to prepare a report upon the subject; this is his report. A similar procedure was adopted by the Board of Trade with regard to one or two special subjects upon which they have issued reports. It has been a means of supplying information to the public without allowing the public to attach a greater importance and a greater authority to the report than it really possessed.

38,004. (*Mr. Chaplin.*) In these reports that you are now speaking of from the Board of Trade do they attempt ever, in any instance, to make any forecasts as to the future?—They have been descriptive of an existing position rather than prophetic of the future; and it would probably be better, if we secured special reports from experts in a country like the United States, that prophecy should be avoided; we should endeavour to supply the facts, and allow the agricultural public to draw their own conclusions from them. At the present moment I do not believe that the agricultural public are sufficiently informed as to the existing facts.

38,005. What you would aim at then, I understand, on behalf of the Board of Agriculture is this: to put in the most compendious and simple form all the information at your disposal, but to express no opinion upon it, beyond the opinions which might be expressed by the authors of any report that you receive from abroad?—I think so. I think we should have to be very careful in giving an adventitious value, to what is, after all, the work of a single individual, however capable or competent that individual might be. Undoubtedly when a department issues a report of the kind the public does attach a special value to it, and does not quite appreciate what the report really is.

38,006. (*Mr. Giffen.*) Perhaps it would be convenient if you were now to specify some of the Board of Trade reports that you refer to?—The reports that I had in my mind were the reports made on the subject of profit-sharing by Mr. Schloss, and one on the subject of wages and production which I myself was commissioned to prepare. Undoubtedly the Board of Trade assumed no responsibility, except the general responsibility of supervision, for those reports. They were not in the ordinary sense of the term official reports. I am afraid I do not make myself quite clear, but they were not reports issued and signed by an officer of the Board of Trade, as if they had been the subject of consideration by the Board of Trade; they were reports of individuals, scrutinised by the Board of Trade, and presented to the public as the work of the individual.

38,007. (*Chairman.*) I understood you to say that you would rather discourage accredited agents making forecasts of the future?—Yes, I think it would be unwise and dangerous. I do not want to say they should never prophesy, and it is a little difficult to draw a distinct line between a statement of facts and inferences as to the future. But I think we should endeavour, as far as possible, to present information to the agricultural public, and leave the agricultural public to draw conclusions from the facts. My point rather is that at the present moment the agricultural public is not fully in possession of the information that it ought to have at its disposal.

38,008. (*Mr. Chaplin.*) But supposing that one of those accredited representatives, we will say, for instance, rather in the United States or in Argentine, had very strong grounds for believing that either the production of wheat was going to fall off greatly or to increase very greatly, do you see any objection to his stating those opinions?—I would rather that he stated the grounds upon which he formed them. For instance, if he had information that land was being taken, that all the arrangements were, in fact, being made, for a considerable extension of the area under wheat cultivation, than I think he should state those facts in his report. Obviously there could be only one inference from such facts as those.

Mr. T. H. Elliott. 7 Dec. 1894.

38,009. Now, with regard to India, I must assume, I think, from what you have told us already, that you are not in a position to give us any more information with regard to wheat-growing in India than you are in the United States?—We have certain general knowledge, but it is scarcely so full and specific as to justify us in placing it before the Commission. Wheat growing in India.

38,010. Then with regard to the Argentine, do the same observations hold good there?—Our information as to the Argentine is extremely limited indeed. We scarcely have any more information than is gathered from the statistical publications, which show to some extent what has been the course of events during the past few years.

38,011. It is the fact, I think, is it not, that Argentine threatens, at present, to be our most formidable competitor?—I should hardly likely to commit myself to that statement. Wheat growing in Argentina.

38,012. The Board of Agriculture has not any sufficient information on the subject?—I do not think the Board of Agriculture have such information as would justify them in stating broadly that the Argentine threatens to be our most formidable competitor.

38,013. I suppose you would admit that it is very desirable, in the interest of wheat-growers in this country, that that sort of information should be available?—I regard it as of great importance to wheat-growers in this country that they should be placed in possession of all that can be learnt with regard to the position and prospects of the wheat-growing industry in the Argentine.

38,014. And upon that subject you have practically at present hardly any information?—We have certainly not sufficiently full information. We have placed some information before the public. In the second number of the Journal of the Board of Agriculture, which we have issued to-day, we have put together all the information that we have with regard to the wheat industry in Argentine, but it does not profess to be an exhaustive review of the position and prospects there.

38,015. Can you suggest to us any means by which we could most easily obtain the information I have been trying to elicit otherwise than by sending sub-commissioners abroad?—It has been suggested that information is obtainable from merchants and bankers, and persons of those classes, who are interested in the Argentine. But we should hesitate to go to those sources of information and issue anything to the public unless we were in a position to place some check upon the statements made to us.

38,016. You are referring now to the information which, I think, Mr. Giffen suggested we might obtain east of Temple Bar?—Yes. I was very much struck by the questions addressed to me by Mr. Giffen, who has a special knowledge of commercial and financial matters; but at the same time I do not see how it would be possible for the Board to issue information on that basis.

38,017. Now, with regard to the question of foreign bounties, I understand that bounties are now given upon live cattle and dead meat from the Argentine; is that so?—Yes; but as I stated in my evidence on Friday last, I think it would be better that information as to bounties should be obtained directly from the Board of Trade rather than from the Board of Agriculture, who in this matter only receive a limited amount of information, and not at first hand. I then stated that a Parliamentary Paper had been issued containing reports on the various bounties on export other than those paid on shipping and sugar; but any information with respect to that subject would, I think, be better obtained first hand from the Board of Trade. Bounties on Argentine exports of wheat.

38,018. With regard to the facts?—With regard to the facts.

38,019. Could you tell me when they began?—That is one of the facts which I think had better be obtained first hand.

38,020. You would rather that we applied to the Board of Trade for information as to when they began, what they include, and what the amount is?—Yes. I am sure the Board of Trade could give that information better than the Board of Agriculture.

38,021. Now with regard to the effects of this policy of bounties generally, that has received, I presume, the consideration of the Board of Agriculture; do you regard it Effect of bounties upon agriculture.

Mr. T. H. Elliott.
7 Dec. 1894.

as a very serious matter for the future of agriculture in this country?—That raises a question of economics upon which I could scarcely express an authoritative opinion as Secretary of the Board of Agriculture. There are two sides to the question of bounties, and of course, our whole fiscal position has to be considered in dealing with any question of the kind. I could scarcely express an opinion.

Bounties on dairy produce in Victoria.

38,022. I am referring now solely to its effects upon the agricultural industry here, and I assume in regard to that point it probably has received the attention of the Board of Agriculture. For instance, many people think that there may be a great opening for British agriculture from a large extension of dairy-farming in this country. In Victoria, I understand, from the brief you have been good enough to give us, that bounties are given upon dairy produce now, and I was rather anxious to ascertain whether this matter had been considered by the Board of Agriculture, and whether in their view it was or was not likely to be very injurious to English industry?—I think it is not a question that can be considered by any one department apart from the Government as a whole. Questions of that kind obviously involve considerations other than agricultural considerations, and they are questions of policy which each Government from time to time must settle as between the conflicting interests concerned.

38,023. Have the Board of Agriculture made any inquiries as to the probable future of this bounty policy on dairying products from the Colony of Victoria?—No; we put ourselves in communication with the Colonial Office with the view to obtaining information on the facts, and we did obtain certain information; but as I stated, the information is not very recent, and matters may have changed since then.

38,024. Can the Board give us here any opinion whatever as to whether both in Argentina and in the Victoria Colony the bounty system upon the exports of agricultural produce is likely to increase, to continue as it is, or to decrease?—That is not a matter upon which I could express any opinion.

Bounties on Argentine exports of meat.

38,025. (*Chairman.*) I did not gather from you that there was any bounty system in the Argentine?—Yes, there is a bounty system in the Argentine.

38,026. In respect of what?—In respect of live cattle, and in respect of tinned and preserved meats, I believe.

Bounties on dairy produce in Victoria.

38,027–8. (*Mr. Chaplin.*) I think you said in answer to me that there were bounties on live cattle and dead meat exported by the Argentine Republic. I must press this point a little further, as I regard this as a very serious question, especially if it is to continue. I observe that in your brief you say: "We have received certain information as to the "Argentine bounties on live cattle and preserved and "frozen meats, and also as to the Victorian bounties for the "promotion of the agricultural, dairy, fruit, and wine, "industries; but it is neither very complete nor up to date, "and it would probably be better that the Commission "should obtain information on the subject from representa- "tives of the Board of Trade and perhaps the Colonial "Office." I am quite willing to concur in that view; but in order to enable us to ask for the information that we want, I think I should like to ask you one or two more questions. Now as regards the Victorian bounties for the promotion of the agricultural and dairying industries, what does "agricultural" include; does it include meat?—I am afraid that any answers to questions as to the facts with regard to the Victorian bounties would be of nothing like the value to the Commission that they ought to be. Our information does not extend beyond 1893. I understood then that the bounties were to come to an end, and for aught that we know they have come to an end; but we have no recent or definite information on the point. My suggestion was that the information could much better be obtained first hand either from the Colonial Office, or from the Board of Trade; we have no direct information on the subject.

38,029. I rather gather from what you say, that this subject has not attracted any very direct attention at present on the part of the Board of Agriculture?—Certainly the facts in 1893 were well known to the Board of Agriculture. But, as I said, questions of this kind cannot be considered by one department apart from the Government as a whole. It is a question of general fiscal policy upon which no department can separate itself from the rest of the administration.

38,030. (*Mr. Giffen.*) Could you give us the statistics of the imports of butter and dairy produce, and of the meat and live cattle from those countries which do give the bounties?—Yes, we could do so, and the Board of Trade could do so. We could do so, of course, on the basis of the Board of Trade information that we have.

Mr. T. H. Elliott.
7 Dec. 1894.

38,031. (*Mr. Chaplin.*) Who is the director of the Intelligence Division?—Major Craigie.

Directors of divisions in the Board of Agriculture.

38,032. And of the Land Division?—Sir Jacob Wilson.

38,033. And of the Animals Division?—Major Tennant is the Principal of the division, but we have professional officers as well.

38,034. I presume that any information that either of those gentlemen could give us, would be at our disposal if we require it?—The usual course would be for the Commission to make the Board acquainted with the information which they require; and then the Board would consider in what way that information could be best given to the Commission on their behalf.

38,035. (*Mr. Long.*) You were, I believe, for some time at the Local Government Board before you went to the Board of Agriculture?—Yes, I was for some time private secretary to the late President of the Local Government Board, Mr. Ritchie.

38,036. When you were there you were of course conversant with the system of general inspectors which obtains there?—Yes.

District inspectors.

38,037. Do you not think it would be desirable for your Department to have inspectors whose duties would be somewhat similar to those performed by the general inspectors of the Local Government Board?—I am not sure that our duties are sufficiently defined as yet to make such a system necessary, but we are doing a great deal in the way of building up such a system. For the purposes connected with the diseases of animals we have divided the country into districts, and we now have an efficient staff in each of those districts to deal with that particular matter. As our duties increase I have no doubt that we shall move forward with the development of an inspecting staff.

38,038. That is hardly an answer to my question, is it, because your inspectors that you have in the country for the purposes of cattle disease would answer rather to the inspectors which the Local Government Board has for the purposes of the public health—that is, for dealing with diseases of the human body?—Yes.

38,039. But the general inspectors have, as you are aware, the duty of inspecting the workhouses, that of course would not be introduced with you, there would be nothing similar for the inspectors of your Department, and they have also to give general accounts of the condition of the whole of the districts over which they are called upon to preside, not merely with regard to pauperism, but with regard to the general surroundings of the people in the district; are not those accounts very valuable to the Department?—That is so; some of the most important information that we have on social questions has been conveyed to the public through the medium of those reports. If we could obtain similar reports periodically from the inspectors under the Lands Improvement Acts I think it would be a great step forward. We want more information, and that might be a means of obtaining it. But of course that would involve the payment, as I said, of a sufficient retaining fee to ensure its being done.

38,040. Of course it would necessitate employing men and having their whole time and paying them a proper remuneration, but is it not the case that at present, take, for instance, the administration of your Cattle Diseases Acts, it is very difficult for you to obtain at first hand reliable information as to the general impressions created in the various districts by your administration of the Acts?—That is so, and one of the points to which I would venture to call the attention of the Commission is the great want that we feel of being brought more into touch with agricultural opinion everywhere. My hope is that through the appointment of a number of regular correspondents of different classes, and by bringing them into touch with the farmers' clubs and agricultural societies we should get better information, and at the same time perhaps put a little more life into these agricultural associations. I certainly hope that may be the course of events in the future.

38,041. Yes, but that is not quite what I mean. An agricultural correspondent is one thing, an accredited representative of the Department in the district is another thing. You have at the present time, have you not, a certain amount of friction arising in different districts in connection with your administration, it is almost unavoidable that there should be something of the kind; there is nobody on the spot to whom a farmer who is in difficulties

Mr. T. H. Elliott.
7 Dec. 1894.

or in doubt, or who wants information, can go with the certainty that he is applying to somebody who represents the Department; he is obliged to apply to your Department in London, and of course there is necessarily a delay in getting what he wants. If there were an inspector do you not think it would facilitate the administration of these Acts exactly in the same way as the presence of the Poor Law inspectors frequently facilitates the carrying out of Acts affecting the health of the people and the administration of the Poor Law?—I do not think it would work out quite in that way, for this reason, that the inspectors of the Local Government Board are in touch with the local authorities, with definitely constituted local authorities, rather than with public opinion as a whole. In the matter of cattle diseases undoubtedly many communications are made to our inspectors, and our inspectors do a great deal to smooth the difficulties which must arise in the administration of the Diseases of Animals Act. But I should scarcely say that we have such distinct and definite duties in the respective localities as would justify the appointment yet of representatives. They would have very limited powers. I think the first thing to be done is to bring us into communication with the agricultural public. I think that gradually the agricultural public would go to our correspondents, for there would be no reason why the fact that a particular gentleman was acting as our correspondent should not be perfectly well known in the district.

38,042. But your correspondent could not speak in the name of the Department as a General Inspector of the Local Government Board can?—I do not know that the General Inspectors of the Local Government Board can speak in the name of the Department except where the policy of the Board is quite clearly defined. I think in practice it would not be quite easy to carry out such a system of representation.

38,043. And you are opposed to it?—No; I should not like to say that, because I am sure there is a great deal of common ground between the Commissioner and myself. I think it would want very careful thought before you could make a scheme of that kind which would work well in practice. One would have to form a clear idea of the matters upon which the representative was to represent the Department.

38,044. Surely there is no very great difficulty as to a clear idea of the matters that such a representative would have to deal with; the matters would clearly be, I imagine, the agriculture of the district to which he was appointed, and it would be his business, I should have thought, to have kept the Board of Agriculture constantly posted as to the condition of agriculture, particularly in his district, and as to the mistakes, if any, that he thought the agriculturists were committing, or that the officers of the Board were committing?—Yes, I should quite concur that functions of that kind would be extremely desirable, and those are precisely the functions which would fall upon the persons whom I have designated correspondents, rather than representatives.

Local agricultural correspondents.

38,045. Are these correspondents to be paid?—I think it would be desirable to give them a small retaining fee, as I believe is done in some other cases. The labour correspondents have, I believe, a small retaining fee, and I should certainly like to give our agricultural correspondents a small retaining fee so that the Board should have a certain hold upon them.

38,046. (*Chairman.*) But you would not pay them for their whole services—for their whole time?—No, I do not think there would be sufficient work for them.

38,047. What you would desire would be the selection of, in fact, a great number of the existing inspectors who are very capable men, and who would report to you from time to time, but would not give up their whole time to the work?—That would be so. All the functions to which Mr. Long has just referred to would vest, and I think quite properly vest, in the person I have in my mind as a correspondent. But a representative should be able to state what the view of the Board was, and he would often not be in a position to do so; he might be able to smooth difficulties.

38,048. (*Mr. Long.*) On the whole I gather that you are in favour of correspondents, who, I suppose, are to be local people scattered about, rather than of accredited representatives in the shape of inspectors?—Yes, I think that would be much better. The essential object that we have in view is the bringing of the Board into closer and more continuous touch with our clients. At the present moment we are not sufficiently in touch with persons actually engaged in agricultural work.

38,049. You are aware, I presume, that there is a very strong feeling in some parts of the agricultural community at all events, in favour of the appointment of some such officers as those whose appointment I have been suggesting to you; have you heard of that, or have you not?—I have not heard any expressions of the kind. I have heard, of course, of a general desire that there should be more continuous and full communication between agriculturists and the Board, and we should wish to give effect to that desire as early and as fully as possible.

Mr. T. H. Elliott.
7 Dec. 1894.
District inspectors.

38,050. In connexion, for instance, with the administration of the Swine Fever Act, you are aware, I presume, that there is a good deal of dissatisfaction in the agricultural mind there?—Yes, I think that it arises from a misunderstanding of the position in the agricultural mind.

Diseases of Animals Act.

38,051. We will come to that presently, please, I only asked you whether you were aware that there was this dissatisfaction?—Yes, undoubtedly.

38,052. We will come to the agricultural mind later one at present I want to know whether there is this dissatisfaction or not?—There is at times local and individual dissatisfaction with regard to the administration of the Diseases of Animals Act.

38,053. It is rather infectious, is it not; when it gets developed in a locality it is apt to spread, is it not?—The dissatisfaction?

38,054. Yes?—I think it does; but on the other hand, I think there is a general recognition that a very valuable work has been done under those Acts.

38,055. I was going to ask you the cause, but you have already told us that it is the agricultural mind which is rather vague?—No; there are some rather subtle distinctions to be drawn and I do not think when a man is suffering from a sense of misfortune and loss, that he is in a position to appreciate those distinctions. We have to do with people who, unfortunately, have had outbreaks of disease on their premises, and I am not in the least degree surprised that they should at times be a little sore on the subject.

38,056. How about the people who have not had outbreaks of disease on their premises; do you think that they are entitled to be sore too, because those are the people I have particularly got in my mind at this moment, and that I was going to ask you a question or two about; I mean cases where your inspectors have cause for suspicion, where they take the necessary steps, but eventually where it turns out that there was no cause for suspicion at all. Are not those the cases where the greater degree of soreness arises?—I should hope that our inspectors would be able to allay dissatisfaction of that kind. I know that when we deal with reports of suspected cases of disease as if they were cases of disease, as we are compelled to do, and when it turns out, as it often does, that disease does not exist, that some dissatisfaction arises; but if we were to leave the suspected outbreaks alone, before we found out whether disease really existed, a great deal of mischief would have been done.

38,057. I do not think anybody suggests that, do they?—I do not know. People who have been put under restrictions, and who, after two or three days, are told that the disease is proved not to be disease at all, sometimes make complaints on the subject.

38,058. Or after two or three weeks?—Sometimes diagnosis is difficult. Where diagnosis is easy, we can deal with the case much more promptly; but when diagnosis is difficult, some time must elapse, and then, of course, an individual sense of grievance does arise. But I am satisfied that the work of the Board under the Diseases of Animals Act has been of immense benefit to the agricultural community, and I should always like to have the opportunity of personally explaining to anyone who is dissatisfied what the real position is.

38,059. When your representatives take charge of a farmyard or of a set of pig-sties, where they believe there is an outbreak of disease, do you think that from the moment of their taking charge to the moment when they release them from their control, you and the Government ought to be responsible for any loss which is sustained?—No; I do not think so. Of course, it may happen that after we have taken charge, the disease may continue in the infected animals and lead to the death of those animals; but the principle of the Diseases Animals Act has been to limit the payment of compensation out of the public funds to animals slaughtered in order to prevent the spread of disease, and not to relieve the owners of animals from the consequences of the disease. If that step were taken, in my opinion, it would be the most fatal and retrograde step

Mr. T. H. Elliott.

7 Dec. 1894.

possible, because there would then be no inducement to individual owners to take those full precautions against the advent of disease which they ought to do.

38,060. But surely there would be much greater inducement than there is at the present time. As you are aware, it is frequently very difficult indeed to detect swine fever; but if an owner has reason to believe that there is a suspicion of swine fever, and reports it to your Department, the Department descend upon him, and exercise very proper restrictions, and put an embargo upon his farmyard. After some considerable delay—time since has elapsed at all events necessarily, for I do not think it is unnecessary delay—it turns out that those precautions were altogether groundless, and that this was not swine fever at all; then supposing that in the meantime, he has sustained a serious loss to his swine, in consequence of the inability to move them and to deal with them; do you still think that that man would not be entitled to some compensation at the hands of the Department, through whose very necessary interference, but still unquestionably through whose interference, he has sustained a loss?—In such a case as that, obviously no bad results from the point of view of disease would arise; but, at the same time, a very grave financial question would be raised, and a new principle would be adopted, which would lead to such a charge upon the public funds, and to such cases of doubt and difficulty, as to be altogether inconsistent with the maintenance of the Diseases of Animals Act.

38,061. What would be the doubt or the difficulty?—The doubt or difficulty that must always arise as to the payment of what one may call indirect damages for the imposition of restrictions. If I may refer to the recent cases of foot-and-mouth disease, we have unfortunately been compelled to put restrictions over very wide areas in the east and south-east of England. Undoubtedly, in order to save the country from a serious epidemic of foot-and-mouth disease, we have been forced to occasion great inconvenience and loss to stock owners in those districts. If it were to be admitted that the Government must pay compensation, the number of claims would amount, not to scores only, not even to hundreds, but one would say to thousands of cases, and it would really break down the Act altogether.

38,062. I think you have failed to appreciate my point, which is a different point altogether. I am referring solely to where you put restrictions upon stock in a yard, and stock die in consequence of the inability of the farmer to move them from one set of stiles to another; they die whilst in charge of your Department when, had your Department not been in charge, they would have been removed and would have been alive. That is a matter that admits of no doubt. The veterinary surgeon inspector can announce an opinion on that?—I can scarcely think that cases such as that would occur. I have never heard of a case in which the stock have died in consequence of the inability of the owner to move them from one place to another.

38,063. Supposing such cases have happened, and they may have happened without your hearing of them, would you contemplate there the possibility of giving some compensation to the owner or to the farmer?—I tremble altogether at any notion of introducing compensation for what one may call indirect damage.

38,064. Very good?—If I may say so, following that up, it is not so much that I object from the point of view of the prevention of the spread of diseases in this particular instance, as from the serious results which would necessarily follow from a financial point of view.

38,065. In your opinion?—In my opinion, yes.

Duties of veterinary inspectors.

38,066. With regard to those veterinary surgeon inspectors, have you any information as to the time that they take in the discharge of their duties? Do you know whether they frequently cross one another, that is to say, whether a man crosses a district which is practically served by another veterinary surgeon, and that consequently a great deal of time is lost, which time would be saved if you could in some way simplify the arrangements as to the veterinaries who are called in for the purpose of inspecting those swine?—I think the Commissioner refers to the veterinary surgeons that we employ in connexion with swine fever?

38,067. Yes?—The principle that we adopt is this: we have a list of veterinary inspectors in each district, whom we employ, and we are very willing whenever any representation is made to us in favour of a suitable person to add to the list. Our policy is to make the list as comprehensive as possible. Immediately we receive telegraphic information as to an outbreak of swine fever we refer to the map, and we telegraph to the veterinary surgeon on our list, who appears to be the nearest to the scene of the outbreak. We have, of course, only the map to guide us, and I dare say cases may have occurred where, in consequence of the map being the only source of our information, a man may have been sent who was not perhaps the most conveniently situated. But I think those cases have been rare. At any rate our policy is to make the list of veterinary surgeons as large a one as possible, and to put on it any competent person who is recommended to us by a responsible person.

38,068. But is there any practical objection to having a much larger number of those veterinary surgeons appointed to act for you than you have at present? Would there be any practical objection; it would not be any addition to the cost?—No. It is a question of the employment of one man rather than another. There is an objection to having too long a list, although our present list is a long one, because it is more difficult for the clerk who receives telegraphic information to select a man from a long list, than from a comparatively small one. But our lists are not by any means very restricted. We have been rather anxious to please as many people in the profession as we possibly could.

38,069. I am not making these suggestions to you with the object of pleasing the members of the profession; I am making them with the object of getting a veterinary surgeon on the spot as rapidly as possible?—Most of the cases of complaints that we have received from veterinary surgeons have been based on the fact that one particular man should have been employed rather than another.

38,070. You do not see any practical objection, if representations were made to you that it would be desirable, to increase the number?—If we received a representation in favour of a competent man from any local authority or from any responsible person in the locality, we should do our very best to give effect to it. Our wish is, as I say, to please as many persons as possible, so long as we can secure the services of competent men.

Regulations for sanitary arrangements of English dairies.

38,071. Now I want to ask you one or two questions with regard to dairy produce. There are very severe restrictions upon the dairies at home, are there not, under the Public Health Acts and under the Cowsheds and Dairies Act?—Yes, that is so, but as the Commissioner well knows, the jurisdiction in regard to dairies and cowsheds is now with the Local Government Board, and not with the Board of Agriculture.

38,072. That I am well aware of; but the Agricultural Department, of course, know that there are these severe restrictions upon the sanitary arrangements of the English dairies, necessary restrictions, I am not finding fault with them, but they are severe?—Yes, that is the case.

38,073. The object I know is to secure that all the conditions with reference to the preparation of dairy produce should be of a perfectly sanitary character?—No doubt.

38,074. I believe that medical men hold, do they not, that milk is rather a dangerous means of conveying infection?—Yes. I have no expert knowledge as to that, but it is a matter of general opinion.

38,075. Therefore, it is on the ground of public health that those restrictions are imposed?—It is so, I believe.

38,076. Do you know whether there is very much foreign milk being imported into this country at the present time, and sold?—I think it is not very large at the present moment.

38,077. Have you heard anything within the last month or six weeks of a very large increase in the amount of foreign milk brought into this country, particularly into London?—No, my attention has not been called to that.

38,078. Does your Department know anything of the conditions under which those foreign dairies are conducted?—I have no information on that point.

Regulations for sanitary arrangements of foreign dairies.

38,079. Do you think it would be advantageous if you could ascertain whether the dairies in any of these other countries, Denmark, or any other of the importing countries, have sanitary arrangements of the same character, as those in the dairies of this country?—I think that such an inquiry would be preferably undertaken by the Local Government Board, which is the Public Health Department; any information as to the possible importation of milk unfit for human food, and dangerous for human consumption, would, I think, be better obtained by the Public Health Department. They would have a better knowledge of what was requisite for the protection of the public health.

38,080. Yes; but there being those restrictions on the English dairies, would it not be the opinion of your Department that it is at least reasonable that milk produced under very dissimilar conditions should not be

Mr. T. H. Elliott.
7 Dec. 1894.

allowed to compete with English milk?—That, again, is a matter that seems to me rather for the decision of the Public Health Authorities; my own personal opinion would be that if it could be shown that milk imported from any country was attended with risk and danger to human health it should not come. But that is rather an individual opinion of mine, and, of course, I am not an expert or an authority on public health questions. I look upon it as a question of public health, rather than as an agricultural question.

District inspectors.

38,081. (*Mr. Dalton.*) I understand you think that if you had a few general inspectors now, somewhat after the fashion of the Local Government Board inspectors, there would not at present be sufficient work for them to do?—That is so. We have not, I should say, sufficient duties of a specific character to assign to a person to whom we officials usually refer under the title of inspector.

38,082. But it would be a great advantage to have some one whose whole time you could command, and to whom you could give the duty of making special reports upon any matter, would it not?—I am not clear that we require at the present time persons in different parts of the country, who would give their whole time to us. My view at present is that everything necessary could be secured by the appointment of a large staff of correspondents of various classes.

38,083. Then you would have to collate the work of those up in London here?—No doubt we should require staff for that purpose in London.

38,084. (*Chairman.*) When you speak of various classes do you mean not merely tenant farmers, or agents; would you include agricultural labourers?—Certainly, if we could secure a thoughtful man with sufficient clerical ability; we should certainly wish to be brought into communication with the agricultural labourer, as well as with the tenant and the landlord.

38,085. (*Mr. Dalton.*) If you have a general inspector he would naturally come in contact with all those classes in his district, and if you wanted a special report, such as our Sub-Commissioners have been making, he would be always available for the purpose. But you think there would not be enough work even for a smaller number than we have at the Local Government Board,—for four or five even?—Of course, I should welcome any additional means of obtaining information; but if I were responsible for making proposals of the kind, I should not at the moment propose to employ persons who would give their whole time to us, and who would be separate from the London staff. It might be useful that we should add to our London staff, so as to obtain the means of sending out into the provinces, but I do not at the moment contemplate the appointment of persons giving their whole time to the work in the provinces.

38,086. Do you find from your numerous inspectors that you can get the information always, or are they unable to give up their time to it; or are they obliged to give up their time to you if you want them especially for any purpose?—The inspectors under the Lands Improvement Acts, are, I am bound to say, always extremely willing to give us most useful and valuable information, in fact I may say that I think we have in recent years trespassed too much upon them. But we need something more of a system; those inspectors simply do the work at the present moment because they are attached to the Board for other work. They are usually men of sufficient public spirit to give us very valuable information, when we really have no distinct claim upon them.

38,087. (*Mr. Lambert.*) Upon that question of the appointment of inspectors similar to the Local Government Board inspectors, I presume the Local Government Board inspectors would have to look over workhouses and such institutions where there is a certain amount of routine in vogue?—Yes, that is so, they have specific duties, sufficiently onerous and numerous to require their whole time for the work.

38,088. Your idea of agricultural correspondents stationed in the districts, would be, I presume that as agriculture varies so much in different districts it would take a man some time to become acquainted with the agriculture of a particular district?—I should assume that we should not appoint anyone in the position of correspondent unless he possessed that information already.

38,089. Would that be your idea in rather objecting to officials such as the Local Government Board inspectors?—I do not think the objection would lie in that; the objection would be that we should not have sufficient specific duties to assign to him.

38,090. How many representatives have you got, or how many correspondents have you got in the counties of England?—We have no correspondents at all, in any proper sense of the term.

Mr. T. H. Elliott.
7 Dec. 1894.

Inspectors under the Lands Improvement Acts.

38,091. I mean the gentlemen whose information this Commission acted upon, or who supplied information through the Board of Agriculture in the first instance when this Commission was started?—Those are gentlemen who are appointed for the work of inspection and survey under the Lands Improvement Acts. A practice has gradually arisen, attended with great advantage, of asking their opinion on other matters than those for which they are specially appointed. But they are not in any sense of the term correspondents, nor are their services at the disposal of the Board.

38,092. How many of them are there?—I think there are about 35 or 36 in Great Britain, but I am speaking from memory.

38,093. How were they appointed—by whom selected?—They are selected from time to time by the Board of Agriculture.

38,094. Upon the recommendation of whom—the local authority?—No, not necessarily. They are appointed by the President of the Board for the time being, who, of course, uses any means that he thinks proper for obtaining information as to the qualifications of the candidates for the appointment.

38,095. They are appointed merely by the President of the Board of Agriculture?—Yes.

Cost of equipment of Board of Agriculture.

38,096. You said that the cost of the Board of Agriculture was something like 46,000*l.* a year?—That is so.

38,097. How much do you consider it would cost to equip it according to your idea of its requirements?—I should be very sorry to give an estimate. Our policy in these matters is gradually to develop the Department. It would be impossible to say what it would cost if it was fully developed immediately. I do not believe it would be possible to do all we want at once.

38,098. How much do you want now, immediately, to carry out your ideas of properly developing it?—I have not considered that question, it very much depends upon our relations with the Treasury for the time being and our means of influence. We move gradually of course.

38,099. But your opinion as to the amount required would not depend upon your relations with the Treasury, your opinion would be formed entirely independent of the Treasury?—Yes, but I am afraid that if I mentioned a very large sum I should be for a long time regarded with grave suspicion by the permanent officials of the Treasury, and I would rather not be either too narrow in my view of what is wanted, or too broad.

38,100. What are the agents of the foreign countries appointed in this country principally for?—I should say for the supply of information likely to be of service to the producers of the countries from which they are accredited.

Competition between British and Danish dairy farmers.

38,101. You said just now that theoretically you considered that the British farmer could compete in dairy production, with the farmers of Denmark—did you mention France as well?—No, I rather endeavoured to avoid expressing a broad opinion of that kind. I suggested that information on those subjects could be better obtained from persons having practical knowledge.

38,102. What persons would you suggest?—I should suggest persons who are actually engaged in the business of dairy farming. The leading men in the industry must know whether they are able to hold their own with foreign competitors. I should be sorry to think that they were not able to hold their own with foreign competitors.

38,103. Has the Board of Agriculture taken any trouble to find out whether the British farmer could compete upon equal terms with the farmers of Denmark; would the conditions of living in Denmark be the same as in England; would the cost of transport be as great, and such small matters which collectively are very important?—I can only say that the impression which I have gathered from what has reached me is that the British farmer could well hold his own in competition with competing dairymen abroad.

Agricultural attachés in foreign countries.

38,104. As regards the agricultural attaché that you suggested being appointed in Argentina or any other country, is it not rather difficult to get information from these countries—say Argentina, which is a newly-developed country, and Australia, and some of the countries that are our chief competitors as regards the production of agricultural produce?—In the case of Argentina I should say

Mr. T. H. Elliott.
7 Dec. 1894.

very difficult; perhaps not so difficult in the case of the Australian colonies.

38,105. That is borne out by this report in which Mr. Gastrell says there is a quasi-impossibility of obtaining data from Argentina; how would you calculate that you would get trustworthy information even if you did appoint an agricultural attaché?—I should hope that the representative of our country would endeavour to place himself in communication with all those who were actually engaged in developing the industry, and an astute man could probably send us from time to time information which would be distinctly valuable.

38,106. But that would be based not upon fact, but more upon inference?—It would be based upon individual information checked as far as possible by reference to existing facts.

Administration of Swine Fever Act.

38,107. (*Mr. Channing.*) When you referred to the swine fever administration as pleasing a number of people, I suppose you meant enlisting the actual support of a large number of persons in the proper working of the Act?—Yes. I used rather a short expression, but that would be, perhaps, the better way of putting it.

38,108. As a matter of fact, I suppose the Board of Agriculture is exercising very careful supervision over the veterinary surgeons who are placed on the list?—Yes, we have always endeavoured to confine our list to persons in whose competence we have confidence.

38,109. And where there was any adequate proof of want of competence or repeated errors in diagnosis, and so on, I suppose you have abstained from calling on the same man again?—Yes, and there have been cases where the names of men have been removed from the list on the advice of our veterinary officers.

38,110. Can you tell me what the per-centages of error in the diagnosis would be, can you give me a rough idea?—The diagnosis does not rest——

38,111. I mean to say the first diagnosis, I am not referring to the diagnosis of the Board of Agriculture, but to the actual suspicion entertained at first by the local veterinary surgeons?—We, of course, know the number of outbreaks, and we also know the number of cases in which swine fever has been declared by our own officers, but I can hardly say that the difference represents mistakes; because diagnosis is only possible with accuracy on the examination of the intestines. The work of diagnosis rests with our veterinary officers at Whitehall Place, and not with the local veterinary surgeon who is simply called in to say that there is a *primâ facie* case of swine fever, and then he proceeds to slaughter the pig.

38,112. Do your instructions give a wide range to your surgeons?—Undoubtedly, it is much better that a pig should be slaughtered, compensation being paid to the owner of the pig in consequence, and that the intestines should be sent up for examination by our own veterinary officers, rather than that a mistake should be made the other way, and the premises released when disease really exists there.

38,113. The evidence before the Board of Agriculture is thought to be conclusive, is it not, that without these extreme precautions, and without this general treatment of the disease, there would hardly be a justification for the administration at all, as there would then be no reasonable prospect of stamping out the disease?—That is the case. We were very much pressed to undertake the very difficult task of dealing with swine fever on the ground that it would be better done by a central authority.

38,114. What is the rule with regard to the cases of pigs which die of swine fever before the Board of Agriculture has declared its diagnosis, is there any compensation given in those cases?—We never pay compensation unless the pig is slaughtered by our order, that is the dividing line between the cases in which compensation is paid out of the public funds and the cases in which compensation is not paid. We are not under any obligation to slaughter a pig, nor do we pay compensation for pigs which die of the disease.

38,115. If the premises are closed, and some of the pigs die before your diagnosis and the order for slaughter arrives, do you not think a case for compensation arises there—not in the instance Mr. Long referred to, but in this case where there is clear proof that the pigs in question died from this disease?—It by no means follows that we consider it desirable to spend public money in slaughtering at all. If we are not under an obligation to slaughter I do not think that we ought to come under any obligation, apart from any other reasons, to pay for pigs which die from disease. It would be a new departure to which no Government would assent without the most careful consideration of the possible consequences which would follow.

Mr. T. H. Elliott.
7 Dec. 1894.

38,116. Of course in the case mentioned by Mr. Long that would be so, but in the case where pigs actually die of disease, and where it is only a question of a few hours whether the order arrives in time for these pigs to be included in the slaughter do you not think the farmer there has a case for compensation?—It does not follow that we should slaughter. We may not consider slaughter at all necessary in order to prevent the spread of the disease.

38,117. (*Mr. Little.*) You slaughter for the sake of the other animals?—Quite so; we slaughter in order to prevent the spread of the disease to other animals; we do not pay compensation to relieve the owner of the pigs from the unfortunate consequences which come to him in consequence of the outbreak of the disease.

38,118. There might be 20 pigs in one place, all of them suffering from the disease, and no other pigs within a mile?—That is so.

38,119. In that case the slaughter would be to relieve the owner from the duty of taking care that he did not buy diseased pigs?—We should not slaughter in that case, because we should not consider the outlay of public money necessary in order to prevent the spread of disease.

38,120. (*Mr. Dalton.*) Might not the disease spread more amongst those 20 pigs from the fact that you would have isolated them all, and that you would not have allowed the man to move some of them away out of the risk of infection?—I should not say that.

38,121. (*Mr. Long.*) Is it not the case that when you slaughter these pigs to prevent infection, there is considerable risk of infection being conveyed by people passing from one farm on to another?—That is so, and that is one of the considerations upon which we act in deciding whether to slaughter or not; sometimes it is more dangerous to slaughter than not to slaughter.

38,122. (*Mr. Channing.*) What is the average time at which the order is issued after the sending up of the intestines?—It very much depends upon the ease with which diagnosis is performed. The diagnosis of swine fever is sometimes an extremely difficult matter, and it does not by any means follow that within a few hours after the arrival of the intestines, swine fever is or is not declared. It may be that another test animal is required to be slaughtered in order to give our veterinary officers still further means of forming an opinion.

38,123. Can you give an idea of the time that elapses before the diagnosis is made?—It entirely depends upon the ease with which the diagnosis can be made; in a very bad case——

38,124. In an ordinary case what is your average time?—In a very malignant case of undoubted swine fever the intestines come up to our laboratory at Whitehall Place, and within an hour or two swine fever is declared and orders are sent to the inspector to deal with the case as if it were swine fever. But on the other hand the case may be so doubtful that our veterinary officer finds himself unable on the appearance of those intestines, to say whether it is or not a case of swine fever. Then he says, "I must have another test animal."

38,125. How long does that usually take?—I have known cases in which a week or a fortnight has elapsed before the veterinary inspector of the Board was in a position to say definitely that it was, or was not, a case of disease. But I do not wish it to be understood that it usually takes a week or a fortnight—it does not.

38,126. Is the order made promptly after the diagnosis?—The order is made very promptly after the diagnosis, but whenever the diagnosis is a matter of difficulty then an interval necessarily occurs. No order for slaughter is made until the diagnosis has taken place.

38,127. Still there may be an appreciable number of cases in which, owing to the delay, pigs may die of the disease which otherwise would probably have been slaughtered?—I have investigated personally a large number of representations that we have received, and I am bound to say that, although there have been cases of delay, they have been extremely rare, and that in nearly every case I have investigated everything has been done as promptly as possible. But undoubtedly pigs have died in some cases in the interval between the first report and the final action of the Board ordering slaughter.

38,128. (*Chairman.*) Do you pay the full value of the pig when slaughtered?—We pay the full value of the pig when it is found to be free from disease; we pay half value when it is found to be diseased.

Mr. T. H. Elliott.
7 Dec. 1894.

38,129. What becomes of the carcases?—It depends upon the condition of the carcase. Very special precautions are taken, and if there is no disease, and no reason to suspect disease, the carcase is sold.

38,130. (*Sir Nigel Kingscote.*) Then it is not buried?—Not in that case, in the other cases it is.

38,131. (*Chairman.*) It is obligatory to bury?—It is not obligatory to bury the carcase of every pig that is killed, because the pig may be perfectly healthy.

38,132. That I understand, but is it obligatory in the case of those that are infected?—The diseased and infected pigs are buried.

Operation of Fertilizers and Feeding Stuffs Act.

38,133. (*Mr. Channing.*) About the Fertilizers Act, have you had any prosecutions?—No.

38,134. Or any applications for prosecutions laid before the Board of Agriculture?—No, not one.

38,135. Would you be free to state what the results of the Act are?—We have been somewhat surprised at the little advantage that has been taken of the provisions of the Act; but many persons of authority have stated to me that the result has been to make sellers of fertilizers and feeding stuffs much more careful than they were. There has been a general levelling up of the conditions under which those articles are sold to the practice of the best and leading firms in the trade.

38,136. The impression then is that it has produced a satisfactory result indirectly?—Indirectly.

38,137. Though not from the criminal part of the Act?—There have been no criminal prosecutions under the Act. I think the result, however, has been indirectly to confer a distinct benefit upon the farmer.

38,138. (*Mr. Lambert.*) Is it not a fact that in a good many instances manure merchants guarantee a very low or minimum analysis in order to evade the provisions of the Act?—I have heard of cases of the kind, but of course a farmer is not compelled to deal with persons who give such guarantees. If in the invoice a merely nominal per-centage of fertilizing ingredients is set out, I should suppose that a prudent farmer would say, "This is not good enough for "me, I must go somewhere else."

38,139. (*Mr. Channing.*) The cure for that would be agricultural education, would it not?—I would not say education, because there are many uneducated men who are quite alive to their own interests, and who would have nothing to do with a manure manufacture who gave nominal guarantees.

38,140. An elementary knowledge of agricultural chemistry would cure that?—I doubt whether the farmer accepts invoices of that kind to any extent; I cannot think that he would.

38,141. (*Mr. Lambert.*) The fact that they are issued shows, I presume, that they must be accepted in some quarters at all events?—I am afraid they have been accepted in some cases; but there is not the least reason why they should be accepted. If a farmer will deal with a person who wishes to evade the Act, in all probability to cover his own deficiencies, he must pay the penalty for it.

38,142. (*Mr. Channing.*) No action has been taken by any agricultural society, or county council, or local authority, under the Act?—No; no prosecutions whatever have been instituted or even suggested under the Act.

Operation of Seeds Adulteration Act.

38,143. Does the Seeds Adulteration Act come under the Board of Agriculture?—We are, of course, acquainted with the provisions of the Seeds Adulteration Act, but we have no functions to perform under that Act.

38,144. You cannot give any information as to the working of those Acts, and the necessity of any further legislation in that direction?—No; in such a matter we should be very much guided by the representations made to us by agriculturists. I do not think we have received any representations to the effect that the present legislation ought to be supplemented; if we did receive such representations we should certainly consider them.

Scientific assistance at disposal of the Board.

38,145. Can you tell me quite what you meant by your reference in an earlier part of your evidence to the Office of Woods?—I ventured to say in my evidence that the Board were sensible of the need for further scientific assistance, and that possibly in connexion with the use of that scientific assistance land would be necessary, and I added that land, if required for that purpose, might possibly be obtained through the means of the Office of Woods.

38,146. As a matter of fact experimental land of this kind need not be of very large area?—No, that is so.

38,147. A very small area at a comparatively low cost might give you a great deal of information?—I think so. The great thing would be that we should have land in many different districts, so as to get a great variety of soils and climatic conditions.

Mr. T. H. Elliott.
7 Dec. 1894.

Agricultural attachés in foreign countries.

38,148. Now as to agricultural correspondents and representatives abroad, did I rightly understand your evidence to express great doubt as to the usefulness of the reference to agriculture in the consular reports which are sent to the Foreign Office?—No, I did not wish in any way to disparage or to minimise the value of the assistance which we have obtained from the consuls; but at the same time we feel that the receipt of reports from persons possessing an expert knowledge of agricultural matters would be better for us than the reports which we at present receive.

38,149. Do you think that the consuls in agricultural countries abroad would, if special instructions were given to them, be able to discharge the duties which you refer to?—No; they already have instructions of the kind, but naturally they have many important duties to perform; they are usually placed at ports, and they do not come in contact with agriculturists, and they are not able to give full attention to agricultural matters which we should hope that a special representative would be able to do.

Relations of the Board with local chambers of agriculture.

38,150. As to obtaining information from agricultural districts at home, has the Board of Agriculture taken any steps to obtain the opinion of local agricultural associations, like the Chambers of Agriculture, as to providing the Board with information of this kind?—Yes. Our practice has been during the last two or three years to write to agricultural societies, and farmers' clubs, with a view of obtaining information whenever questions arose, upon which we desired to obtain local information. I refer, of course, rather to specific matters of interest in the district.

38,151. You are aware that in many of the counties the Chambers of Agriculture and farmers' clubs are of considerable value, from a practical point of view, as sources of information?—Yes.

38,152. They comprise some of the most active and most able representatives of agriculture in the counties?—Yes, that is so; and we are very anxious indeed to do everything in our power to foster local agricultural associations, whether Chambers of Agriculture, or farmers' clubs. My view would be that if we ever get agricultural correspondents, they will, as a part of their duties, always attend the meetings of the Chambers of Agriculture, and farmers' clubs, and agricultural societies, so that they may be a link between the Board and these societies. I think it would be desirable that these societies should be brought more closely into contact with the Board; I think it would be better for the Board, and better for the societies.

38,153. Do you not think the Board of Agriculture might do something, through those very means of obtaining systematic information, to promote the better organisation of these local Chambers of Agriculture, something more like the French *Syndicats Agricoles*?—Yes; that is very much the ultimate policy to which we are directing our thoughts. I should say that few things are likely to be of more benefit to agriculture than the active association of farmers in these local institutions, and in connexion with these local institutions, with the central Department here.

38,154. You are aware that too many of these local associations, and Chambers of Agriculture are mere vehicles for letting off steam rather than for practical work?—Yes. That is not in itself, as the Commissioner knows, a useless function, but we should hope to add other more useful functions. We should like to make them more analogous to the French *Syndicats Agricoles*.

38,155. My questions are pointing very much in the direction of your answers, that is, I should, like to ask this, whether you do not think you could promote the formation of working committees of these Chambers of Agriculture to provide you with the information which you wish, and whether that would not be a short way of making these bodies useful and practical instead of being merely debating societies?—Of course there is always a certain danger of Government intervention in matters of that kind. I should scarcely like to say off hand whether it would be desirable that a government department should take active steps to promote the formation of these bodies; but I am sure that the more closely we are brought into communication with them the better.

Local agricultural correspondents.

38,156. Would not the sort of machinery which I suggest form itself if you appealed to them for the purpose of giving to you more accurate information under specific heads?—I think it is very possible, and I think that suggestion very well worth consideration; but I am inclined

Mr. T. H. Elliott. 7 Dec. 1894.

to think that it would be desirable that we should have one single individual upon whom we should have a distinct hold, rather than that we should simply leave the local institutions to discuss matters, and to send us as much or as little information as they pleased.

38,157. I think you said that the representative need not be entirely at your own disposal?—Certainly not; on the contrary, I can scarcely conceive of any cases in which it would be desirable that he should be entirely at our disposal.

38,158. So that the salary need not be exorbitant?—It would not be very much more than a nominal retaining fee, very much of the same character as is paid to the Labour Correspondents of the Labour Department of the Board of Trade.

Estimates as to out-put of growing crops.

38,159. As to the information about crops abroad, I should like to ask you whether the Department has taken any steps to verify the prophecies which are made in the United States certainly, and I daresay in other countries, as to the probable crops?—No, we receive the official information contained in the official reports, but we have no means of examining and testing that information.

38,160. In certain periods of the year the American Agricultural Department, I believe, announces the probable results of the various crops in the country; have you taken any steps to ascertain how those prophecies in certain months correspond ultimately with the results?—That would be one of the advantages to be gained, I think, by the existence of special agricultural representatives; they would be able to place themselves in communication with the agricultural departments with a view of finding out what the figures published really mean.

38,161. If you had an average of three or four years you would be able to give the British farmer a better opportunity of judging how far the next prophecy is likely to be true?—Of course an average of three or four years is better than one year, but it also depends upon the value of the information averaged. If there is a fundamental error in each of the four years, your average is not much better than taking a single year.

38,162. (*Mr. Little.*) Except for the comparative purposes?—That is assuming that the error is always the same and always one way.

38,163. They generally balance one another to some extent, do they not?—Yes.

Board of Agriculture and county councils.

38,164. (*Mr. Everett.*) With regard to the sources of information, I would respectfully suggest that it is well worth the Board of Agriculture considering whether they would not put themselves in communication with the different county councils. My impression is that the county councils would be glad to appoint agricultural committees out of their bodies to answer any questions in a regular way which came from the Board of Agriculture, if we had a regular official means of communication between the county councils and your Board?—I should say that that suggestion is very deserving indeed of consideration. Perhaps I may be allowed to say that I have desired to emphasise the need the Board feel for obtaining further information, rather than to particularise the means by which we should obtain that information. There are many points to be considered in connexion with the means, but I rather wanted on behalf of the Board to bring before the Commission the need that we feel.

Journal of the Board.

38,165. The only other question I have to ask you is this, whether it is your intention to give such information as the consuls and other sources put you in possession of, in the journal which you are now beginning to publish, so that by means of that the agricultural classes can know what you know, that is likely to be of interest to them?—Yes, that is the case. We have already done that in the two numbers of the journal which have been published. That was one of the objects of the journal.

Inspectors under the Lands Improvement Acts.

38,166. (*Mr. Little.*) One question about the inspectors: I think you contemplate making some use of the inspectors under Land Improvement Acts, as referees for special purposes?—Yes, I regard them as the nucleus and the very heart of any staff of correspondents. They undoubtedly are the most valuable means of information, but the very fact that they are so valuable, makes it at times difficult to ask them to report to us about smaller matters.

38,167. Would it be necessary to assign to them definite areas such as they have not at present?—I think some movement in that direction would probably be found desirable.

38,168. They are not now confined to one particular district, nor is their district very accurately defined?—That is the case, and I think our organisation perhaps is deficient in that respect.

Mr. T. H. Elliott. 7 Dec. 1894.

38,169. (*Sir Nigel Kingscote.*) I see that when you were here last Friday Mr. Everett asked you about the expression "cultivated areas" which is used in your returns?—Yes.

Definition of expressions used in agricultural returns.

38,170. You ended your answer in this way: "We have "got rather into the habit of including grass in the cul- "tivated areas." My experience has been that this term has been very much misunderstood, and I do not know whether the Board could alter it in any way?—It is an expression that we rather use colloquially than officially. I think I gave in answer to the Commissioner the full heading in the published returns.

38,171. "Total acreage under all kinds of crops, bare "fallow and grass"?—That is so.

38,172. Do you think that is too comprehensive?—No.

38,173. Would you not divide it up?—I do not think it is too comprehensive for the purposes for which it is used. Practically that term denotes all the land in respect of which we obtain returns.

38,174. Do you think it would be advisable to keep it as it is?—I think so. I do not like the expression "cul- "tivated areas," but I do not know of any expression which would include everything that is mentioned under that heading at all well.

Uniform weights and measures.

38,175. May I ask whether in getting out your returns you find any difficulty owing to the great difference of the weights and measures throughout the country?—I do not think for the purposes of our statistical work that we have experienced any great difficulty under that head.

38,176. Have you ever heard it stated that there is a great disadvantage in the different weights and measures?—There is, of course, always a disadvantage arising from the absence of uniformity in matters of weights and measures, but it is a defect which probably time and growing custom can alone remedy. As the Commissioner knows, the question of the manner in which corn is sold is one which has been fully considered by a Parliamentary Committee.

38,177. You have never had it brought before you very strongly that there was a great disadvantage in the case of two neighbouring towns—say Bristol and Birmingham—owing to the difference of calculations for sale by weight or by measure, which make it extremely difficult mentally to calculate what is meant by each measure?—I should quite agree that there are many inconveniences attaching to varying customs of sale in towns in close proximity to one another. My hesitation arises from the fact that I do not think legislation could remedy the deficiency.

38,178. Could it not?—I do not think it would be possible to compel persons to depart from long established custom and to adopt a new custom.

38,179. Do you think it would be impossible to have the same standard of weights and measures for grain—we will say—made compulsory throughout the country?—Perhaps I ought not to say that it would be impossible, but there is a very large amount of inertia and custom to be set aside. I think we are improving in regard to our weights and measures; but I am not quite sure that a new statute would have an immediate effect.

38,180. Not if it were made compulsory?—There are some things which you cannot make compulsory.

38,181. (*Mr. Little.*) Is it not the fact that in France, where the decimal system has been legally established for pretty nearly a hundred years, bargains are made and sales effected locally on the old weights and measures?—Yes; I believe that is the case, and of course some of the old denominations are still used in connexion with the currency. It is extremely difficult to alter long-established customs, I did not express my opinion with any hesitation as to the advantages of a uniform system, but I think we may expect too much from a mere legislative enactment.

Inspectors under Diseases of Animals Acts.

38,182. (*Sir Nigel Kingscote.*) You have a certain number of travelling inspectors, I believe?—Yes, but we no longer call them travelling inspectors. They are really inspectors for the purposes of the Diseases of Animals Act.

38,183. Simply for that?—We can use them for other purposes, but that is the primary object of their appointment.

38,184. In their vocation, as it at present is, have they not very frequently to come in contact—and in intimate contact—with the farming community?—That is so.

38,185. It occurred to me whether they could be used in the way you have indicated before in other branches of the

Mr. T. H. Elliott.
7 Dec. 1894.

Board of Agriculture?—I think that might be possible as time goes on, but up to the present they have been fully occupied with their own special work, and the great majority of them have only been appointed within the last year. They have as yet obtained no sufficient experience of things.

38,186. I suppose these gentlemen have at times very hard and onerous work?—It is very hard and onerous work indeed, and very difficult work to perform without friction.

Educational branch of the Board.

38,187. (*Chairman.*) We will now go to the next branch in the Department, namely, the educational branch. Will you describe the details of the duties of the staff?—In the first place, in the educational branch of the Department we undertake business and correspondence connected with the administration and allocation of the parliamentary grant or agricultural education. We examine, discuss, and amend, schemes for the organisation of agricultural teaching bodies. We inspect educational institutions which come to us for financial aid. We examine and report on schemes of examination, and we confer, when so requested, with county councils and local bodies respecting their systems of agricultural education, advising them thereon, inspecting the work when in operation, and reporting thereon for the information of the councils or local bodies.

Parliamentary education grants.

38,188. A grant was first given in the year 1888 for this purpose, I think?—In the year 1888–9.

38,189. It then amounted to 5,000*l.*?—Yes, a sum of 5,000*l.* was placed at the disposal of the then Agricultural Department.

38,190. It has since been increased to 8,000*l.*?—Yes.

38,191. Is that the amount at which it now stands?—Yes, it now stands at 8,000*l.*

38,192. Then in the interval considerable sums have been placed at the disposal of the county councils under the Local Taxation Act, 1890, I think?—Yes, that was so. The Board then began to look for something of more than merely local value in the institutions aided.

County council education grants.

38,193. Have you kept yourself informed as to what has been done by the county councils?—Yes, as far as possible; and we have certain information which we have gathered from Parliamentary Returns, which is included in the memorandum I have laid before the Commission, showing the progress of agricultural education since the year 1888 up to the present time.

38,194. Do you know how much of the funds at the disposal of the county councils is devoted to agriculture?—No, that information is not obtainable with exact precision, but agricultural subjects certainly form an integral portion of the various schemes of technical education, which county councils have adopted under the Local Taxation Act.

38,195. You cannot form an opinion how much is devoted to that branch?—No; I think information on that subject would be better obtained from the Science and Art Department or the Education Office, because they have direct information on the subject of the administration of the local taxation moneys.

County councils and agricultural education.

38,196. Have you not got any information in your Department on the subject; one would be disposed, in view of your own grant of 8,000*l.* a year, to think it would be well to ascertain in what directions the county councils are moving too?—We have information as to the directions, and I can give information to the Commission on that point. My answer was directed rather with reference to the financial question. The instruction given by the county councils includes dairying (comprising practical butter-making and sometimes cheese-making), horticulture, poultry-keeping, and instruction in certain processes of agriculture, such as ploughing, hedging, stacking, &c. Then the county councils give evening lectures in matters relating to farm life and practice and demonstrations in the open field in matters relating to the economical manuring of land. Dairying is taught by 47 out of the 49 counties of England, the two exceptions being London and Middlesex.

38,197. Out of the county council funds?—Yes.

Distribution of educational grants by the Board.

38,198. Out of your own funds—the 8,000*l.*—about 4,600*l.* appears to be given to England and Wales mainly in support of the collegiate centres?—Yes. Since 1891–2 we have adopted the policy of devoting the greater part of the aid which the Board can give within the limits of their grant to the support of the work done by the large collegiate centres which already exist, and which we are endeavouring to foster in places where they are still required.

38,199. You made grants to seven colleges apparently?—We make grants at the present moment to seven collegiate centres in England and Wales, and to two or three in Scotland.

Mr. T. H. Elliott.
7 Dec. 1894.

38,200. Which are the colleges in England that you assist?—In England we assist by substantial grants the Durham College of Science at Newcastle, which is working for Northumberland and Durham and probably Cumberland, and which we think should also cover Westmoreland, the Yorkshire College at Leeds, which is working for the three Ridings of Yorkshire, the University College at Nottingham, which is working for Nottinghamshire alone, but which will shortly be doing work for Derbyshire and Leicestershire, and we think should also include Lincolnshire, Rutland, and Northamptonshire, the Cambridge and Counties Agricultural Education Committee at Cambridge, which we hope will eventually act as a centre for all the eastern counties, and finally the University Extension College at Reading, which is at present working for Berkshire, Oxfordshire, and Hampshire, and we think may ultimately be expected to do the same for Wiltshire, Bucks, and Middlesex, and possibly Dorset and the Isle of Wight. Those are the five centres at present existing which we aid in England.

38,201. (*Mr. Lambert.*) You have none in Devonshire, Cornwall, or Somerset?—No, but we think it is possible that those counties may eventually be served by the new University Extension College at Exeter which I believe is in process of constitution.

38,202. Will you make any grant to that college if it is constituted?—We always hesitate to say that we will make a grant, but we should certainly hope to be in a position to make a grant.

38,203. (*Chairman.*) Then what are the centres in Wales?—There is the University College of North Wales at Bangor, which is engaged in working for Anglesea, Carnarvon, Denbigh, Flint, and part of Montgomeryshire, and the University College of Wales at Aberyswith, which is engaged in working for Cardigan, Merioneth, part of Montgomeryshire, Radnor, Brecon, Carmarthen and Pembroke.

38,204. What is being done in Scotland?—In Scotland the centre system is not nearly so well advanced as in England and Wales, and it is not yet certain if it will answer for that country so well as for England. At present the Glasgow College does work for some of the south-western counties, but the work is not very clearly defined, and the relations between the counties and the college are not so close as they are, as a rule, in England and Wales. In Edinburgh, under very influential auspices, a scheme for the organisation of a fully equipped agricultural centre in connexion with the university, which we hope will consolidate several permanent teaching agencies, is being gradually elaborated, and a beginning in the same direction has been attempted at Aberdeen.

38,205. Have any of those colleges also received assistance from the county councils?—They undertake teaching work for the councils, for which they receive payment from the councils.

Students at agricultural colleges.

38,206. What class of students are received at these colleges?—There are several classes of students. Possibly it would be convenient to mention the different heads under which we think the collegiate centres may with advantage work. There is first of all the technical training of the teachers, mostly belonging to the elementary schools, who are capable of giving instruction to lads in evening schools and classes. Then we think the collegiate centres may provide experts for giving instruction in various branches of practice, such as dairying, horticulture, poultry keeping, and the like. Then there is the provision of instruction to actual farmers in those matters, of a semi-scientific, semi-practical character, which are now usually classified under the head of extension lectures, and which comprise such subjects as the economic use of artificial fertilisers and feeding stuffs, the injurious insects, and other pests affecting farm crops, and methods of their prevention or cure, the hygiene of the farm, and the treatment of stock in health or disease. Then they should conduct stations of field demonstration and experiment; they should provide courses of scientific instruction likely to be of use to the sons of farmers in the district at a cost within the reach of the class for which they are intended; they should also be the means of intercourse between the staff of the college and the farmers in the neighbourhood, so that agriculturists of the district may turn to the college for information and assistance in every matter of a scientific character; and then they should also constitute a body of scientific experts to whom the county councils may refer for assistance. Of

Mr. T. H. Elliott.

7 Dec. 1894.

course all those objects are not fully attained at the existing centres, but that is the direction in which we are working.

Agricultural teaching by Science and Art Department.

38,207. What is done through the medium of the science and art classes?—One of the subjects taught at the science and art classes is the subject styled "Principles of Agriculture," in respect of which grants are awarded to the teachers by the Science and Art Department of the Education Office. The syllabus has recently been recast, and it has probably been brought into more actual relation with the necessities of the case than was previously the case, but we are not responsible for it, and it is a matter upon which the Commission might preferably examine an officer in the Science and Art Department itself.

Evening continuation schools.

38,208. Then with regard to evening continuation schools?—A distinct step has been taken forward in that direction during the last year or two. A code with a practical scheme has been prescribed by the Education Department, and it is to be hoped that that will further the interests of agricultural instruction in the rural districts.

Public money for agricultural education.

38,209. I suppose you cannot form an opinion as to what public money, on the whole, is devoted to agricultural education, taking all these different heads together?—No; it is rather difficult to do that. The only grant in respect of which we have any actual function is the grant of 8,000*l*. We are, from time to time, in communication with the Science and Art Department and with the Education Department, as to matters of agricultural education falling within their jurisdiction; but we have no direct information.

38,210. The funds at the disposal of the county councils are very considerable?—Yes; they are; and although I cannot say what is the cost of the work, undoubtedly they have done, and are doing, a very considerable work in the development of agricultural education generally, and especially in dairying.

Elementary school teachers trained in agriculture.

38,211. (*Mr. Channing.*) Have you any information as to the number of elementary school teachers who are receiving any training in agriculture and agricultural subjects to fit them for dealing with those subjects in the elementary schools?—No. A large number of elementary school teachers do receive a certain amount of instruction at some of the collegiate centres, but I have no statistics on the subject.

Number of students at agricultural colleges.

38,212. Cannot you give us any idea of the number of students in connexion with the agricultural grants at these various colleges?—Detailed information is given in the annual report that we publish, and it would probably be possible to reduce the statistics in that report to a tabular statement. If the Commissioner would wish it, I would endeavour to see whether some tabular statement of the kind could not be prepared and put in.

38,213. The question I asked you was really in this direction: to know how far the want had been already supplied, or how far it would be necessary to considerably supplement these grants in order to obtain an adequate supply?—I think that some increase of the grant will very shortly become absolutely necessary; but in some of the counties where the collegiate centres are fairly well organised, as in the case of Yorkshire for instance, practically no further financial assistance is requisite. I visited the Yorkshire College, at Leeds, a few weeks ago, and I was then assured that, except in one single direction, the Board could do nothing more to further agricultural education at the present moment in connexion with that college.

Yorkshire College, Leeds.

University College at Nottingham.

38,214. What is being done at the Nottingham College; are the students there in connexion with the agricultural classes, farmers or sons of farmers, or are they persons preparing for employment as surveyors or agents?—The University College at Nottingham is not very fully organised, that being one of the centres in process of organisation. The class at present at the college, according to the latest information we have, consists of seven second year students, of whom five are county scholars, and six first year students, of whom one is a county scholar. The students mostly come from Nottinghamshire; but one comes from Derbyshire, and another from Leicestershire; the majority are sons of land agents or farmers.

38,215. Are they receiving a general training in agricultural subjects?—Yes.

38,216. Is that college doing anything with elementary teachers?—I think that college is not doing anything at the present moment in regard to the training of the elementary teachers, but we should hope that that is one of the directions in which development will be possible. At the Yorkshire College the training of elementary teachers is going on to a very full extent.

38,217. Is there an intention to start a college at Cambridge in connexion with the Committee?—The Committee will make use of the facilities afforded at Cambridge itself, of course, at the colleges, but there again the arrangements are not by any means complete, and the centre is not a fully organised collegiate centre.

38,218. Then in the case of any suggestion in connexion with the University College at Nottingham—for instance, that certain other counties shall be included in the scope of the college—is that meant by the Board as a recommendation to the county councils to give scholarships, or anything of that kind in connexion with the college?—Yes, that is so. During the financial year 1893–94 the expenditure has been partly met by county council contributions amounting to 505*l*., and we gave 400*l*. Our policy as regards these grants has always been to use them to supplement the grants made by the county councils of the area through which the college was intended to work.

38,219. I suppose you would adopt the remark made in the report of the Bangor College, I think, that this Government grant, as it were, operates as a guarantee to the county councils and associations that the money will be well spent?—No doubt; just as in the same way the fact that the county councils contribute to the finances of the college is a sort of guarantee to the Board that it really meets the wants of the locality, and is in touch with the farmers and agriculturists generally of the locality.

38,220. Your recommendation with regard to Northamptonshire, for instance, would be interpreted, then, as meaning a recommendation from the Board that the county council should provide facilities in the way of scholarships for exhibitions to agricultural students of Northamptonshire to attend the Nottingham College?—Yes, that is so, and that there should be full co-operation between the county council for Northamptonshire, which is already doing important work under the Local Taxation Act, and the college, which is a sort of centre of higher instruction for a comparatively wide district. We look upon co-operation between the county councils and the colleges as essential for the success of our general scheme.

38,221. (*Mr. Lambert.*) Do you attach great importance to the fact that the Board of Agriculture should have the dispensing of this money?—No.

38,222. In preference—I would go on just to explain it—to the localities?—Of course the localities dispense their own funds. We have a small grant, which we use for purposes of something more than a local character. We use them in aid of higher agricultural education for a district comprising several counties—for a large district.

38,223. My idea was that there should be some kind of co-operation between the local authorities and the Board of Agriculture, so that there should be some system in their actual outlay?—The contributions of the local authorities, no doubt, are made with some regard to what the Board are doing, and the Board make their contributions with considerable regard to what the local authorities are doing. Each of the two authorities, the central authority and the local authority, distributes its own money with a knowledge of what the other is doing.

Experiments in agriculture by the Board.

38,224. Do you think it would be possible in such a case as Essex, where the cultivation of the land, if it is to be cultivated at all, must change, that the Board of Agriculture could carry out such experiments in grasses and such like as would enable the Essex farmers to benefit upon a point on which I believe the report of the Sub-Commissioner stated that they were somewhat in the dark?—I dealt with that question to some extent in a previous portion of my evidence. I said that we attached very great importance to the increase of the scientific assistance at our disposal, and that we were in communication with the Office of Works with a view to making arrangements so that the staff at Kew Gardens could give more continuous attention to matters affecting British agriculture. I should certainly think it extremely desirable that, if it is necessary to supplement the work which is being done by private agencies in scientific experiments of this kind, the Board should be able to do it; but a great deal of work is being done by private agencies, of course.

38,225. The cultivation that is being carried on at Kew Gardens would hardly be synonymous with, or similar to, the cultivation that would be carried on in Essex?—No, I did not mention the work that is being done at Kew Gardens as fulfilling our requirements, but in Kew Gardens we have a botanical organisation which, in our opinion, can eventually be made much more use of for British agriculture than is at present the case. It probably would be necessary, that the actual experiments in a matter of that kind should be made down in Essex on the Essex lands;

Mr. T. H. Elliott.

7 Dec. 1894.

but the botanical staff at the disposal of the Government at Kew might with advantage be entrusted with the supervision of the work.

38,226. I quite agree, but do you think the Board of Agriculture could undertake such an experiment as an experiment upon the growth of grasses upon Essex land, and then disseminate the information thus gained amongst the farmers of Essex?—I think we ought to be in a position to undertake experiments of that kind, if we were satisfied that those experiments were not being done by private agencies. We are rather working in that direction. I mentioned that we were in communication with the Office of Works and Kew Gardens with a view to placing ourselves in that position.

38,227. I understand that you want to be quite guarded, but otherwise you would discourage private enterprise?—Very much has been done for British agriculture by private enterprise, and anyone who is acquainted with the records knows that it has been done in a way in which a Government Department could not have done it. But there are points on which I think it is quite possible that the Government might supplement private enterprise.

Effect of educational grants upon agriculture.

38,228. (*Mr. Dalton.*) You would have no doubt that this small grant has been spent in very useful and productive work, I presume?—I have no doubt at all. I believe that this small grant has really galvanised the whole position as regards agricultural education. It has, I think, stimulated agricultural education with very great advantage all over the country.

38,229. (*Mr. Chaplin.*) In the first place, I want you to bear in mind that, in the questions I am going to ask you, I am referring to dairy education almost entirely. As far as you are able to tell us, I think the Commission would like to know what you think have been the general results of the grant which was first given by the Government to the Board of Agriculture or the Privy Council in 1888–9, and since the large sums were placed at the disposal of the local authority, for the purposes of technical education, by the Act of 1890. What effect has that had upon improved dairy farming in the United Kingdom?—I have no hesitation in saying that all the evidence which reaches me shows that that grant has had a most beneficial effect. I remember that some little while ago, the Northumberland County Council issued a circular to students who had attended the dairy classes at the Durham College, and inquired what had been their practical experience. A very large percentage of the students said that their practical experience was, that they got more for their butter than they formerly got. I see before me, in connexion with the Bangor College, that the report of the Welshpool Dairy School is, that increased prices have been obtained for their produce by those who had come under instruction there, especially cheese, which fetched 10*s.* to 20*s.* more per cwt. Then at Denbigh, the report from the school there says, the butter and the cheese in the district have greatly improved, and prices are better. At Bangor, again, an improvement in the quality of the butter of the district is reported, and prejudice is being overcome, and the sale of modern implements is continuing. All the evidence goes to show that the work which is being done, the stimulus which is being given to sound instruction in dairying, has had an actual practical benefit.

38,230. As far as you know is the instruction which is now being given under those circumstances pretty general, or is it limited to certain districts?—It is pretty general. As I stated, dairying is taught by 47 out of the 49 county councils in England, the two exceptions being London and Middlesex; and by all 13 in Wales. In Scotland dairying is taught by about 18 out of 30 administrative counties.

38,231. Before that time was everything left to voluntary effort?—Before the original grant of 5,000*l.* everything was left to voluntary effort. Then came the period when there was a Government grant of 5,000*l.*, and something was done in consequence of that grant. Then came the Local Taxation Act, which put considerable funds in the hands of county councils, and still more has been done.

38,232. (*Sir Nigel Kingscote.*) In what year was it begun?—The first grant was in 1888–9.

38,233. (*Mr. Chaplin.*) And the Local Government Act is 1890?—Yes, 1890–1.

38,234. It is the case, I think, is it not; or perhaps you will tell us as far as you can, that before that period when the first grant was given, in a vast number of counties in England the manufacture of butter and of dairy produce generally, was very bad and very inferior?—Yes, that is so.

38,235. From the information at the disposal of the Board do you find that there has been a marked improvement?—I think there has been a considerable improvement; but I am also satisfied, from the information which reaches me, that there is still room for improvement, and naturally these dairy classes and demonstrations have had to gain the confidence of persons engaged in practical work. There was a distrust of them at first, but they are gradually establishing themselves, as we believe, in the confidence of those who are practically engaged in the work, and that is having an effect.

38,236. Where they do take root at all they excite great interest, I believe; is that not so?—Yes, that is so; and I should say that they are exciting increasing interest, that the distrust of the farmer in any scientific training in practical matters, is diminishing.

38,237. But to confine ourselves for the moment to dairy education, there is still, in spite of what has been done already, a very large field for further improvement?—Yes, I think a large field for further improvement.

38,238. Improved dairy farming has great advantages, I understand; the returns are so quick, are they not?—The returns are quick.

38,239. There has been a marked rise in prices wherever the material has been better?—That perhaps is putting it too broadly; but, as is evident from the extracts I have read, these dairy schools have ensured better prices in many districts.

38,240. The work is very often done by travelling dairies, is it not?—Yes, the work is ordinarily carried out by means of travelling dairy schools, where courses usually of ten days are given in the improved methods of butter making.

38,241. Is it not often the case—I am speaking now from my recollection of the reports—that after a district has been visited you receive most encouraging reports of the results of the sales of their butter when they have made it on the improved principle?—Yes, such reports as those from which I have quoted, but I should not wish it to be inferred that everything has been done that can be done.

38,242. Assuming that it should be regarded, or proved to be a matter of great importance to promote the dairy industry in the United Kingdom on a much wider scale by every possible means, so as to enable the dairy products produced in this country to take the place to a considerable extent of the dairy products that we annually import—if that was the object in view, how, in your opinion, would that best be obtained—by making an effort to extend it through the means of a central authority, or by the local authority, as it is being done now?—I think you would be bound to keep in view the fact that the county councils have taken up this work since they have had at their disposal the grants under the Local Taxation Act, and encourage them in every possible way to go on with their work.

38,243. Is their work inspected now by the Board of Agriculture; have you any *locus standi*?—We have no *locus standi*; but in 1892–93 the work of Northumberland, Cumberland, and Hampshire, was reported upon by us at the request of the county councils; and in 1893–94 we reported on these counties again, and also on the counties of Berkshire, Cheshire, Derbyshire, and Essex; that is, those county councils came to us and said—I am putting their statements very freely—"We are working to some "extent in the dark, will you let your inspector come and "inspect our work and make a report upon it." That has been done in these seven cases, and, I believe that our inspection has been beneficial to the county councils. I think the county councils themselves would say so. That that was the case is proved by the fact that they came again to us for inspection the next year.

38,244. Where you make grants from your own fund of 8,000*l.* which is at your disposal, I understand you make them on the principle of payment by results; that is, you inspect the work and make a fresh grant for the following year rather in accordance with the work that has been done, is that not so?—Yes, we always inspect before we make the grant; but, of course, the amount of the grant is dependent upon a good many considerations.

38,245. I rather gather, then, that your general opinion is this; that in any effort which is made to extend dairy farming in this country, you would avail yourself of the local machinery existing at present?—Yes, I am sure that I would do so. So much has been done by the county councils that it would be very desirable to take advantage of the fact, and to stimulate them to further work in every possible way.

Mr. T. H. Elliott. 7 Dec. 1894.

38,246. Can you suggest anything to the Commission which would have, in your opinion, the effect of further promoting it?—No, I do not know that I could. The fact that the Commission regards the work as of importance will probably help us to obtain the small increase of our 8,000*l.* grant, which will eventually be necessary; but I think all the organisation exists, and I think it is growing up satisfactorily. Of course, the organisation of technical education generally is a matter upon which a good deal has recently been said, and probably some improvement is necessary. Technical education, of course, would include the agricultural education of which we are now speaking.

38,247. What I rather want to arrive at is this: I regard it myself as offering perhaps one of the most important openings for agriculture at the present time that you can find in any direction. Is there anything that can be done by the Board of Agriculture, if they had the means at their disposal, that you could suggest, which would enable them to promote and push the extension of dairy farming all over the country as much as possible?—No, I do not think so. I think that the county councils are doing extremely good work out of the funds at their absolute disposal; and although I think that, in common with all kinds of technical education, possibly the organisation of the county councils might be improved, I do not think there is much room for the intervention of a central authority, excepting in connexion with the development of those collegiate centres to which we are steadily directing ourselves.

38,248. I apprehend that we must be a very long way behind Denmark and other foreign countries—some parts of France, for instance—in dairy farming at present?—I should say that we are very much less behind than we were, and that we have now all the means of providing as much education in dairying as is necessary. I should say that there was much work to be done, but that the whole thing is moving forward very well. I can come to no other conclusion from the information before me.

38,249. Is it still the case that Danish butter and foreign butter as a rule command a much higher price than English butter?—I should wish the Commission to understand that I quite think there is very considerable room for further work; but that, in my opinion, we have now all the means and organisation for the purpose.

38,250. What I want to arrive at is what is to be done, and what can be done in order to put that organisation into thorough operation?—I think the organisation is in thorough operation, but of course you cannot suddenly improve the value of the whole product; it must be all over the country, in every farmhouse where butter is made, a matter of growth. I think the growth up to the present time, since the 5,000*l.* grant was originally given, has been very considerable indeed. I think the growth has been a rapid growth, and I do not see any means by which you can accelerate the rate of growth.

38,251. Supposing that instead of a grant of 5,000*l.* you had had a grant of 50,000*l.* placed at the disposal of the Board of Agriculture at that time, could you not have made much more rapid progress with improved dairy farming; could you not have established schools and given instruction in all parts of the kingdom?—Of course very considerable funds were placed at the disposal of the county councils in 1890–1. I think my answer would be—it is a matter of conjecture—that if 50,000*l.* had been placed at the disposal of the Board in 1888 rather than 5,000*l.*, and there had never been a Local Taxation Act, not so much would have been done. I think the local authorities have each in their own counties done more to stimulate the work than the central department could have done.

38,252. I am afraid it is still the case, is it not, that in many districts of England, if you go to farm-house after farm-house, or cottage after cottage where butter is made it is abominable?—That is the case, one knows it from one's own personal experience.

38,253. Still you can recommend nothing to improve that state of things except the existing machinery?—The existing machinery is a very powerful machinery. In such a matter as dairying you may provide more means for education than are really useful.

38,254. In Denmark and France encouragement is given to it entirely by the central authorities, is that not so?—I am not sure that that is the case. We have, of course, local authorities in this country who perform many functions which the central authority performs in foreign countries.

38,255. Shall we get the information about Denmark in the memorandum you were good enough to say you would let us have?—I will try to include information on the subject of education. I should like to emphasize the fact that in consequence of the Local Taxation Act, and the powers given to the county councils to aid technical education, and especially agricultural and dairy education, you have enlisted the practical interest of large numbers of persons all over the country, who form the technical education committees of the county council work, a beneficial result which would not have accrued, I think, if the central authority had endeavoured to do it all.

38,256. I suppose that both in Denmark and in France they have had a very considerable start of us in giving encouragement to improved dairy work?—I think there is no doubt about that.

38,257. Do you recollect when they began; will that information be supplied to us too?—I am not quite sure that we know that; but I will look up the point.

38,258. (*Mr. Gilmour.*) Have you any statistics to show the class of man who gets the benefit of this education at the local centres or collegiate centres that you advocate so strongly?—There are many different classes. As regards the long courses given, the classes which are benefitted are, as far as I can ascertain, of a slightly lower social scale than those who go to Downton or Cirencester. They are, to a very great extent, persons intending to be farmers or land agents. The fees are usually lower, lower than at Downton or Cirencester, and consequently intending farmers or land agents of a slightly lower class avail themselves of them. Then, of course, there are the teachers. So far as the short courses are concerned, the persons attending are usually actually farmers' sons, or persons actually engaged in the business of agriculture.

38,259. Would you consider the most practical steps for the county councils to carry out the spread of agricultural education, to be the proper instruction of Board School teachers, so that they can teach the rudiments in their different schools or districts?—The elementary schools are expressly excluded from our purview; it is for the Education Department to adjust the claims of the different branches of education to be given in an elementary school. Possibly, in my position I should be inclined to attach too much value to the necessity for agricultural education; but it is for the Education Department to weigh the advantages of the different kinds of education.

38,260. (*Sir Nigel Kingscote.*) As regards the experiments, did I gather from what you said that you thought the Board of Agriculture could undertake experiments, on a small scale we will say, but on a sufficient scale—for instance, the growing of grass on land in Essex, or anything of that sort in different parts of the country?—I think we ought to be in a position to do any work of that kind when we are satisfied that it is not being fully and sufficiently done by private agencies. I was suggesting that the Board of Agriculture ought to have a more complete scientific staff than is at present at their disposal. We have made a step as regards the obtaining of botanical assistance; but if it had not been for our technical adviser, Mr. Whitehead, who is a member of this Commission, we should have been absolutely devoid of the assistance of any one who knew anything whatever about botany. Our scientific staff is ludicrously small for an Agricultural Department.

38,261. You think you would like to see it increased gradually?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

For Mr. Elliott's further evidence, *see* page 190.

Seventieth Day.

Thursday, 13th December 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.
Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., Alan Mackinnon, Esq., *Assistant Secretaries.*

The Right Hon. Lord Farrer called and examined.

Right Hon. Lord Farrer. 13 Dec. 1894.

38,262. (*Chairman.*) I believe you were a member of the Gold and Silver Commission which reported in 1888?—I was.

38,263. And also of Lord Herschell's more recent Indian Committee?—I was.

Views on the currency question.

38,264. You were one of the six members of the Gold and Silver Commission which signed the report of the monometallist members of that Commission?—Yes, I was.

38,265. Have you read the evidence given by Professor Foxwell, Mr. Everett, and Mr. Hoare before this Commission in favour of bimetallism?—Yes, I have.

38,266. And also that of Mr. Giffen?—Yes.

38,267. Have you recently stated your views at length in an article in the October number of the "National Review"?—Yes.

38,268. I believe the six members of the Commission who signed the Monometallist Report were adverse to the scheme of bimetallism, and they reported that there was no conclusive evidence that gold had depreciated in value?—That is so.

38,269. The scheme of the bimetallists is to alter and depreciate the present gold standard, is it not?—That, so far as I understand it, is the object of the bimetallists.

38,270. They also propose a double standard?—And they also propose a double standard of gold and silver.

38,271. Will you explain what your view of that is?—I may say at once that when the Gold and Silver Commission reported, the subject was comparatively new, the investigation was an extremely difficult one, and the conclusions of the six members were expressed in language of very great moderation. So far from departing from the conclusions to which these six members came, I have seen every reason since then to be more and more confirmed in my opinion; and were I to have the wording of the conclusions of those six members now I should make that wording a great deal stronger than it was made then.

38,272. (*Mr. Chaplin.*) One of those six members has since changed his opinions, I understand?—So he has stated. So have I changed my opinions; they are much stronger than they were.

Effect of bimetallism.

38,273. Will you state shortly what, in your opinion, is the effect of the proposal to adopt a double standard?—The effect of the proposal, as I understand it, is twofold; first, to degrade the present standard, to have a standard which is of less value, and by that means to raise prices; and, in the second place, to do away with the break of gauge, if one may so speak, between silver and gold, and the difficulties which have arisen in the exchange between the gold and silver using countries. It is proposed for that purpose to open the mints of all countries to both gold and silver, at some fixed ratio, at present undetermined; but a ratio which, as I understand, from the bimetallists witnesses will be more favourable to silver than the present market ratio; and also—and this is the sting of the proposal—to enable debtors to pay their debts either in the one metal or the other as they please. That, I understand, to be the essence of the bimetallist proposal.

38,274. (*Chairman.*) I presume you will say that a proposal of that kind would require a very strong case for the change, and a very distinct proof of the feasibility and success of the proposed remedy?—Looking at the thing *à priori*, it would require a very strong case, indeed, for the change. A proposal to degrade our standard is a most serious proposal, and one that has always been looked upon with great disfavour by the greatest statesmen and economists. The proposal to tie two things together in a fixed ratio of value, the natural supply of which is different, and the demand for which is different, is also a proposal contrary to all our *a priori* notions of trade and exchange. It therefore requires very complete evidence on the part of those who support such a proposal, to show, first, that there is a need for it; secondly, that it is possible; and thirdly, that great advantages will arise from it. It is not sufficient for them to pick holes in the arguments of their adversaries; it is for them to establish their case.

38,275. (*Mr. Chaplin.*) In your opinion?—I say that it is so, and have no hesitation in saying that it is so, opinion or no opinion.

Arguments in favour of bimetallism.

38,276. (*Chairman.*) I think you understand that there are two main arguments in favour of the change; will you state briefly what you consider those two are?—One argument is that our own gold standard is imperfect; that, as the bimetallists put it, gold has appreciated, and consequently that prices have fallen, and that trade is depressed. That is one argument. The other argument is that there is a great inconvenience arising from the break of gauge between gold and silver.

Appreciation of gold.

38,277. With regard to the first of those arguments what have you to say?—I do not think the agitation in favour of bimetallism would have made any progress at all, if it were not for the notion that by adopting bimetallism we should increase the quantity of money and raise prices. The idea is that gold has appreciated, in other words, that the standard has become more valuable in comparison with commodities, and that consequently prices have been lowered, and that in consequence of the depression of prices industries of all kinds have been depressed.

38,278. It is on this main point that you principally propose to give evidence to-day, I believe?—That, I think, is the most important point of all, because I believe that if that can be disposed of the bimetallists will find no support for their agitation.

38,279. In your opinion, have the opponents of the present standard proved their case on this point?—I think they have totally failed to prove it, and I will proceed to give reasons why.

Right Hon. Lord Farrer.
13 Dec. 1894.

38,280. Will you state those reasons as succintly as you can?—They are very fond of talking of the appreciation of gold. I object to that phrase altogether, and for this reason:—"Appreciation" and "depreciation" are words of relation which when applied to gold signify the relation between gold and something else. If you use the word appreciation with respect to a particular article, I can perfectly well understand it; but when you speak of the appreciation of gold simply you speak of it without reference to any particular article, and you speak of it as if gold had appreciated with reference to everything else. Not only have the bimetallists not proved that to be true, but I think I shall be able to show that it can be proved that that is not true: and I object to the use of a phrase which involves the conclusion to which they wish to come. The true form of expression would be, the fall of certain prices. What have the bimetallists proved? There is no doubt whatever that a large proportion, by far the largest proportion, of commodities that are sold in the wholesale markets of the country have fallen in value very greatly since about the years 1870–73. About that there is no doubt whatever; no one can dispute it. They refer to index numbers; index numbers of the Economist, index numbers of Mr. Sauerbeck, index numbers that are given by the Hamburg authorities, by Dr. Soetbeer. In addition, they ought to refer to the index numbers, that are given in the report of the Senate Committee of the United States on prices there. This report and its appendices appear to me to contain by far the most complete investigation of prices and wages that has yet been made. There is no doubt whatever, as I say, that in regard to the great bulk of those wholesale commodities sold in such markets as London and Hamburg, and New York, gold prices have fallen very largely within the last 20 or 30 years. But those prices are not the prices of all articles measured in gold, very far indeed from it. First of all let me say with regard to those index numbers and the lines or diagrams which have been constructed from them, that whilst it may be useful to have recourse to such expedients for the purpose of expressing a general conclusion, the use of those index numbers, and of the lines, is calculated to blind men's minds to the real facts of the case. If you will look at the list of those articles, and of the prices you will find that there is an immense variety. Some articles such as coffee and coal, and salt, have actually risen within this period; of articles which have fallen some have fallen more, some less. When you come to look at the causes which have affected the price of those different articles, you find that those articles have diminished most in price with respect to which one can see that there are causes having nothing whatever to do with gold or the circulating medium. I think therefore that it is very necessary to use great caution when we have these sweeping lines and index numbers. Again, when I look at the list of articles that is given by Mr. Sauerbeck, the list that is before this Commission, I see, in the first place, that they do not by any means comprise all wholesale articles. By far the greater part of them are either food, or raw materials, or something approaching to food and raw materials. There is hardly an attempt made to give the price of finished manufactured articles. If you are to have a complete induction those ought to be included. I do not say they would alter the general result; but in the United States report to which I have referred, the endeavour has been to include them, and consequently you will find manufactured articles included in this Senate Report. Then the prices in these lists do not include retail prices; and we should probably find that retail prices have diminished very much less than wholesale prices. That is rather a remarkable fact, because gold is frequently used in retail purchases, but gold is hardly ever used at all in wholesale purchases. Then those lists contain no prices of houses and lands, I will come to that presently; and they contain no reference whatever to some of the most important articles, which are measured in gold, viz., the price of labour, and of human service.

38,281. The six members of the Royal Commission on Gold and Silver in 1888, of which you were one, appeared to be under the impression that the wages of labour had fallen?—That was rather the impression, but we had no very distinct evidence about that.

38,282. Since then the public has at hand a good deal more information on the subject?—A great deal more information. I will come to that directly, but I should like, before I come to that, to refer to what appears to me to be the strongest argument for what is called the appreciation of gold, namely, the fact that prices rose from the beginning of the gold discoveries about 1850 to 1870 or 1873, when France and Germany adopted a gold standard; and that since that time prices have, on the whole fallen. The argument is (and I admit that it is *primâ facie* a strong argument), that improvements in transport and production were going on before 1870 as well as after 1870, and that although all those improvements in transport and production were going on still prices rose. The argument drawn from that is that that came upon a different monetary epoch, an epoch when gold was becoming more abundant, whereas whatever improvements there were subsequent to 1870 came upon a period when the supplies of gold were becoming less abundant, and when the demands upon gold were becoming greater. I will fully admit the force of that argument, and I will give what appears to me to be a complete answer to it. In the first place there was, as we all know, a great boom before 1872, one of those periods of speculation and feverish activity which resulted in high prices, which I conceive to have been one of the greatest misfortunes that this country has experienced in late times. I doubt very much whether we have even yet recovered from the effects of that boom. A still more important answer is that the improvements which have been effected especially in transport, have had a very much greater effect since 1870 than they had before.

Right Hon. Lord Farrer.
13 Dec. 1894.

Improvements in transport and production before and since 1870.

38,283. (*Mr. Giffen.*) A greater real effect?—Yes, a greater real effect. It is impossible to go into this at the length which would be necessary to exhaust the subject. I have read a great deal about it, but I have nowhere read anything upon this point so good as is contained in some papers by the late Professor Erwin Nasse, which were contained in the Annual of National Economy and Statistics, published at Jena in 1888–89, I think after the Report of the Gold and Silver Commission. He there points out that the great wars of the century, the Crimean War, the Austro-Russian War, the Franco-Austrian War, the Franco-German War, the American Civil War, and the Indian Mutiny, all took place in the earlier part of the period in question, and that the period since 1873 has been comparatively peaceful, leaving free scope to the employment of accumulating capital and of industry in the arts of production and transport.

Effect of improvements in production and transport on prices of finished articles and raw products compared.

38,284. (*Chairman.*) By the earlier periods, do you mean 1850 to 1870–73?—Yes. He further points out that the effect of improvements in production and transport is cumulative; that both the chief building of railways and the development of railways already built in America and in India, in Russia, and other parts of the world, have taken place in the later period; that the use of the Suez Canal and the greatest improvements and economies in ocean navigation have taken place since 1870; that the improvements in European and American manufactures preceded these improvements in transport. and that whilst the earlier improvements in manufacture affected finished products, subsequent improvements in transport brought into use large portions of the globe hitherto uncultivated, and thus largely reduced the cost of agricultural products, *i.e.*, of food and raw materials, and through the reduction of the cost of raw materials, reduced still further the cost of manufacture—that the statistics of prices confirm this view, since they show that the cost of raw material rose much more than that of manufactured goods until 1872–3, and since then has sunk much more. He further points out that the fall in the prices of different articles, so far from being uniform, differs very greatly indeed; that the greatest fall has taken place in the case of those articles the supply of which are most affected by improvements in production and transport, whilst some articles, in the case of which there has been no such improvement, there is no substantial fall. To this he adds that since 1870 many nations, seeking to protect themselves against a fall of prices, have adopted a system of protection which is, as is well known, if it at first secures a higher price at home ultimately tends to glut, to over-production, and to low prices in free markets. One passage in this article is so important that I wish to put it in, and, if the Commission will allow me, to read it This is the argument upon which he places the greatest reliance "But the chief argument against attributing the fall " in price of the most numerous and important classes " of commodities to changes in the conditions of

Right Hon. Lord Farrer.

Dec. 1894.

"production is, that in earlier periods also, great "advances were made in production without a general "fall in prices. From 1850 to 1873, the improvements "in the arts of manufacture in agriculture, and in the "transport system were not less than from 1873 to "1887; and was yet accompanied by a rising rather "than a sinking of the general price level. We will, "for the sake of argument, not raise the question "whether the advances in the arts of manufacture and "of agriculture were equally great in the two periods, "although it seems probable to us, for the reason "already given, that the spread and practical application "of the discoveries and improvements made in any "given place, took effect much more quickly during the "second period than during the first. But the essential "difference between the two periods consists in the "different development of the conditions of production "of nearly all vegetable and mineral raw materials. "In the earlier period, the advances in production "which were made in commerce, manufactures and "agriculture in times of vigorous economical develop-"ment, were, as a rule counteracted by the growing "difficulty of obtaining from the same area the "agricultural produce necessary for a quickly growing "population. In the very period just mentioned, from "1850 to 1873, which is generally chosen for com-"parison; there was a very remarkable rise in the "prices of vegetable and animal products. According "to the Hamburg tables of prices, the whole of the "114 articles chosen for comparison were, on an "average, 33·29 per cent. dearer in 1870–75 than in "1847–50, farming produce 44·9 per cent. and animal "produce about 54·57 per cent. The rise in the price "of all the other different classes of commodities "mentioned in these tables remained under an average "of 33 to 29 per cent." "In the second period, that "which dates from 1873, on the other hand, the case "was quite different. If we compare the prices in the "Hamburg tables from 1871–5 with those of 1886, "mining and smelting produce show the greatest "reduction in price, viz., 40 per cent.; after that "farming products sank 31 per cent. in price; then "textile stuffs, which are also agricultural produce, sank "24 per cent.; further animal produce sank 23 per cent. "while the average decrease in the price of all the 100 "articles amounted to 22 per cent. In the last 12 or "15 years the influence has been wanting, which in "the period immediately preceding, arose out of the "rising prices of most raw materials, the production "of which is dependent on the soil and counteracted "the decrease of expenses of manufacture and of the pre-"paration of the raw material. This is of the greatest "importance. A fall in the prices of the most impor-"tant raw materials for food and clothing, exercises a "much stronger influence upon the range of other "prices, than a reduction in the cost of production of "finished manufactured goods. The price of the raw "material forms a necessary part of the price of all "goods manufactured from it; the price of the article "finished for human consumption has only an indirect "and always a small effect on other prices." The fact is that it is during those years since 1870 that Asia, South America, and the western part of North America, have all been made to furnish us with raw materials, and with food. They have been developed. I came curiously enough since I was asked to give evidence upon an article by Mr. Mulhall in the "Contemporary" of December on the carrying trade, and the facts are so interesting that I think I may just give the summary. He gives it from 1860, but one must remember that when a railway is made it is not immediately of use, nor was the Suez Canal immediately of the greatest use. It is a matter of development; and consequently in the later period you have the carrying power much more developed than you have in the earlier period. Mr. Mulhall states that the carrying power of the world at sea has more than doubled since 1860, namely, from 21,000,000 tons in 1860 to 48,000,000 in 1892. One British seaman does as much in 1892 as four did in 1860. The mileage of railways in the world has increased from about 32,000 in 1860, to 141,000 in 1892; this increase has been much greater since 1870 than before. In the year 1850 the ordinary cost of land carriage for goods in Europe was 8*d.* a mile. In 1892 the ordinary average charged for goods in Europe and the United States was about 1*d.* a mile. Those are figures that I do not guarantee; I give them on Mr. Mulhall's authority; but I have no doubt that his figures with regard to the tonnage of the sea-carrying trade, and the mileage of the railways are accurate, as they are very easily accessible. The traffic of the world by land and sea has grown ten-fold since 1850. That entirely bears out Professor's Nasse's views.

Carrying power of the world at sea.

Right Hon. Lord Farrer.

13 Dec. 1894.

38,285. (*Mr. Giffen.*) He does not distinguish between the growth after 1870 and the growth before that?—Mulhall does not.

38,286. That is the point I am putting to you now?—He does not in the figures I have now given. But he gives more figures; and he points out that you will find more figures there, and he says that the growth has been much more rapid, as I think our own tables would show, since 1870, than it was before.

38,287. I am asking the question because I think not; the growth of shipping was much more before 1870?—I think the whole development of shipping as well as railway business and the work done is greater since 1870.

38,288. (*Chairman.*) There has been a much greater extension of steam shipping?—A far greater extension of steam shipping.

38,289. The steam shipping would carry infinitely more in proportion than sailing vessels?—Yes, and freights have fallen much more since then than they did before.

38,290. Have you anything further on that special point?—No; it is a subject upon which one might talk all day, but that is the general view that I wish to give about it.

Course of retail prices.

38,291. I need hardly point out that since 1888 the production of gold has been much greater?—I think we will not come to that now; I should propose to go next to retail prices. We have no statistics that I know of, certainly in this country, on the subject of retail prices; but there can be no doubt that they have not fallen as much as wholesale prices for the very good and obvious reason that English labour enters into them more than it does into the prices of these wholesale imported commodities.

38,292. If labour had not fallen in price it would naturally follow that that portion of the retail price which is due to labour would be maintained?—Certainly.

38,293. That, of course, is another proof that wages have not fallen?—Quite so.

Prices of houses and lands.

38,294. Then with regard to the prices of houses and lands?—With regard to them, I would only say that it rests with the bimetallists to prove their case, and they have not attempted to give us any statistics of the prices of houses and lands. With regard to the price of agricultural land, no doubt it has fallen, we do not need statistics to prove that; but I doubt very much whether the price of land in England generally, taking all purposes into consideration, has fallen. The price of land, for instance, in my own county, Surrey, has certainly been constantly rising, and rising very fast. Probably it is so wherever there is a residential demand, for instance, all round the coast. For this one sees reasons connected with the land and quite independent of the currency.

38,295. Where the prices of the produce have not fallen, do you consider that there the value of the land has been maintained?—I should think it probably has, but I have not any precise or statistical knowledge upon the subject.

Prices of service and labour.

38,296. Then we come to the prices of service?—I will take the prices of service and of labour together. We had very imperfect figures about the price of labour before the Gold and Silver Commission. We have a good deal more now. There, again, the subject is endless, but I would refer to one or two main points. This Commission has before them Mr. Giffen's rates of wages in many trades. I have nothing to add to that; I will only say upon it that scarcely any wages have fallen, and on the whole they have risen according to that table. What has struck me more than anything else is the evidence which has been obtained by the Labour Commission. I have made these extracts from the report of the Labour Commission. In their general report, paragraph 4, they say this:—"The general im-"pression left by the information before us is that the "level of wage rates has risen considerably during the "50 years both in respect of their nominal value, and "(with the exception of house rent in large towns) "their power of purchasing commodities. At the "same time it appears that the daily hours of labour "have, during the same period, been in most cases "shortened, and the sanitary conditions of work "improved"—that is in the 50 years which they take.

Right Hon. Lord Farrer.
13 Dec. 1894.

But much more striking is Mr. Little's summary of the inquiry as to the agricultural labourer. In that report, pages 204 to 217, are these paragraphs which I have copied out: "Upon one point there is an almost "unanimous opinion expressed by the Assistant Commissioners, and by every class of persons from whom "they received evidence, and that is as to the great "improvement which has taken place in the labourers "condition during the last 20 years. If, in some parts "of the country, wages are now lower than they were "10 years ago they are certainly higher than at any "period previous to 1873–4, and there is reason to "believe that the average earnings within the reach "of a willing and capable worker are, in most districts, "considerably in excess of what they were 20 years "ago. Any comparison of the present conditions with "those prevailing 30 or 40 years ago would be still "more favourable to the present period. Machinery "has relieved the labourer of much of the hardest work. "The hours of labour have been sensibly diminished. "Regular employment is not difficult to obtain by "those who are willing to engage themselves. The "acquisition of allotments have been facilitated. "Before the passing of the Elementary Education Act, "1870, it was very generally believed that the labourer "could not dispense with the earnings of his young "children. That difficulty was, however, surmounted. "and at the same time the wives of the labourers very "generally withdrew from field work, and the family "became dependent, in many cases, upon the single "wage earner for its maintenance. Notwithstanding "these changes the evidence is conclusive as to the "labourers, and their families being better fed and "better clothed than formerly. If the state of the "cottages is still far from what is desirable, it cannot "be denied that the average condition of the dwellings "of the poor is better, and that the standard of comfort is "higher than it was. The most effective agent in bringing about the improved condition of the agricultural "labourer has undoubtedly been the cheapness of all "the prime necessaries of life. His wages will purchase "more bread, meat, butter, cheese, sugar, tea and "clothing than could have been bought for the same "money 20 years ago, and it is probably no exaggeration to state that 16*s.* will buy as much of the "principal commodities which a labourer consumes in "the proportions in which he requires them as could "have been bought for a sovereign in 1871–2." It is only fair to say that Mr. Little in his subsequent paragraph 83 expresses a doubt whether under the present condition of agricultural production and prices the condition of the labourer can be maintained. Then I have seen a suggestion that although the wages may be higher there is a greater want of employment. I think upon that point the statistics of pauperism are conclusive. I will not trouble the Commission with many figures, but I put in a return of the numbers of paupers of all classes (indoor and outdoor) in England and Wales separating and distinguishing between them for each of the 46 parochial years ending Lady-day 1894 (*see* Appendix VIII.), from which it will be seen that if we take 1870 the ratio of paupers per thousand of the estimated population was in that year 46·5, whilst in 1894 it is 26·5. There has been a slight increase in the last two years, but otherwise it is a constant and great diminution.

Wages of agricultural labour.

Diminution of pauperism.

Statistics of salaries.

38,297. (*Mr. Dallon.*) Do you give in that table the mean number of the paupers?—Yes, paupers of all classes. Then I asked myself the question: how is it with regard to salaries. Have salaries on the whole diminished in amount? Wages we see have increased in nominal amount, and increased very much more in real amount—in what they would purchase—in purchasing power. I have got no statistics that I can put forward confidently as stating completely what is the position with regard to salaries; but I have got this information from the Inland Revenue Office:—I have got the whole of the Assessments for Schedule E, divided by the number of persons assessed (*see* Appendix IX.). The results are interesting. I am quite aware that the table is open to a great many observations. Mr. Giffen knows, and I know, how slippery these statistics are.

38,298. (*Chairman.*) Schedule E is confined to salaries, is it not?—Yes. According to these returns the average income per head was 182·2*l.* in 1870–1; 176·9*l.* for 1871–2; 179·2*l.* for 1872–3 and then we come to the last three years, when for 1890–1 it is 203*l.*; for 1891–2 it is 198·8*l.*, and for 1892–3 it is 205·9*l.* Therefore, so far as these figures go there has been no falling off in salaries.

Right Hon. Lord Farrer.
13 Dec. 1894.

38,299. (*Mr. Giffen.*) Is that the average salary measured by the number of assessments?—Yes. I put it only for what it is worth. Probably the great bulk of these salaries are small salaries.

38,300. Are they not also official salaries?—A great many of them are official salaries, certainly.

38,301. (*Mr. Little.*) Does it include assessments of salaries which do not pay Income Tax?—No.

38,302. The table includes the whole salaries without the abatement which is claimed where the amount is under 400*l.*?—This is the assessment.

38,303. (*Mr. Giffen.*) The gross assessment?—The gross assessment.

38,304. (*Mr. Little.*) Then it would not be affected by the deduction allowed being increased?—I do not think it would.

38,305. (*Chairman.*) Is it not within your information that the salaries of the lower clerks of the Public Service at the Post Office, and generally in the Public Service, have been rather increased than diminished?—Certainly.

38,306. Then wages in the dockyards?—Wages in the dockyards have been increased.

38,307. And the wages of policemen generally throughout the country?—Yes.

38,308. All tending to show that wages and the lower salaries have been increased rather than diminished?—Certainly.

38,309. Would you say that the increase of wages and salaries is, so far as it goes, inconsistent with the theory that gold has appreciated?—Yes. If you are to ask whether gold has appreciated or not, you have to compare gold not only with a certain quantity of wholesale commodities, but you have to compare it with everything which is measured in gold. You have to compare the price of labour, and the price of services, at different times, just as much as the price of wholesale commodities. It is nonsense to talk of a general appreciation of gold when you have a large quantity of things which are measured in gold which have risen in price and have not fallen.

Wages and prices in the United States.

38,310. Is this information as to the rise of wages and salaries confirmed by the experience of the United States and other countries?—Yes, of the United States, certainly, and, as far as I know, of other countries, but I have no accurate figures of other countries. Erwin Nasse, in the articles I have referred to, thinks that wages in Germany have on the whole increased, and, so far as I know, whatever other evidence there is, is to the same effect. In the United States we have a very remarkable collection of statistics. The United States Senate Committee set the best statisticians in the United States to report upon prices and wages from 1850 down to the present time. The result is contained in seven volumes, of which I have here two, in which all the details are contained. I am sorry to say I have not studied them in detail, and I should very likely be not much the wiser if I did. I can only take the general results as given, not by any party in the United States, but by the United States Official Statisticians, Professor Falkner and Mr. Carroll Wright, who, I believe, are men of very high reputation. I shall be happy to give this volume to any member of the Commission who likes to look at it. It is a volume easily accessible; I have abstracted from it the index numbers of prices of wholesale articles and of wages in the United States from 1860 to 1891—I have not gone back to 1850 because I did not think that was in question—taken from the report of Professor Falkner, statistician to the United States, appended to the Report of the Committee of the Senate on wholesale prices, on wages and on transportation, dated 3rd March 1893 (*see* Appendix X.). The tables will be found on the pages I have referred to in the heading. They take, both for prices and wages, 100 in 1860 as the starting point. I presume they take that as the period before the war and before the inflation which took place when the United States Government issued forced paper money. The statisticians have averaged those figures in different ways, by simply averaging all articles, by averaging them according to their importance, and by averaging them also according to the degree in which the different articles are consumed or supposed to be consumed by the families of the United States. I have taken the simple averages alone because the difference in results for our purpose is small. The results are very interesting. If you take all articles averaged in

Right Hon. Lord Farrer.
13 Dec. 1894.

currency, beginning with the figure 100 in 1860 they rise most rapidly to 1865, which was the period of the greatest inflation, and the figure 100 then becomes 216. The figures in currency then diminish gradually to 1879, when specie payments were resumed. In 1878 they are 101·3 and in 1879, when you come to gold payments again, they have fallen from 100 to 96·6. They then rise to 108 in 1882, and 106 in 1883, and then they fall steadily from 106 in 1883 to 92·2 in 1891.

38,311. Is that all in currency?—That is in currency. To take parallel figures in gold they begin in 1860 at 100. In 1865, when the currency prices were 216, they were 100 in gold; then they rose in gold during the period of inflation, as high as 127 in 1872, and they fall to 104 in 1877, to 96 in 1879, and then of course the figures are the same as in the other column. Wages start in 1860 at 100, as prices did. We have seen that by 1865 with the inflated currency prices had risen from 100 to 216, but wages in currency had only risen from 100 to 143; consequently the unfortunate wage earner received only 43 per cent. more in wages while he had to pay 116 per cent. more in prices. I do not know that you could have any stronger proof of the robbery which an inflated currency inflicts upon the wage earner.

38,312. (*Mr. Giffen.*) These are not retail prices now?—No, these are wholesale prices, but of course they affect retail prices. The wages in currency rise in 1873 to 167, which I think is their highest point. They then fall till we get back to the gold period in 1879 to 139, and then they rise to 160 in 1891. Consequently the gold wages compared with prices fell greatly during the period of inflation, but the moment you come to a period of a sound gold currency the gold prices fall and the gold wages rise.

38,313. Can you tell us if agricultural wages are included?—I believe not.

38,314. Agricultural wages as well?—Yes, this appears on the face of it to be a summary of "All wages," but I do not see agricultural wages specially mentioned.

38,315. I asked the question particularly because I doubt very much if they ever have included agricultural wages in their statistics; but I am not specially acquainted with this Report of the Senate Committee?—I dare say you are right. Of course agricultural wages are not so important in the United States as they are here.

38,316. (*Chairman.*) Perhaps you will look it up between now and to-morrow?—Yes.

38,317. The figures you have quoted show that coincident with a great reduction of prices of the principal articles of consumption, there has in the United States been an increase of wages when stated in gold?—Yes. Before leaving this return there is one further column which I think is worth noticing. That column gives all wages averaged in gold. That also begins at 100 in 1860; it goes down during the period of the war to 76, 80, and 66. It then after the war begins to rise and rises steadily from 108 in 1866 to 160 in 1891.

38,318. Those facts bear out the facts which you have quoted for England, although, perhaps, in England the rise has not been so considerable?—Yes, and they bear out what I think is so very important to show, namely, how an inflation of the currency robs the wage earner.

38,319. It is not made up for by an increase of money wages?—It is not nearly made up. There is an attempt in this the same United States report to give salaries, but it is so imperfect that I have not thought it worth while to quote it.

Effect of increase in money wages and of purchasing power.

38,320. What deduction do you draw from this increase of wages in money, and the still further increase in the purchasing power of wages?—It is exactly what I should have expected in an advancing community. Man gains through the means of human ingenuity a greater command over the earth's products, and over the means of turning them into what is useful for human life; the consequence is that a certain quantity of human labour goes a great deal farther than it did, and that human labour is properly remunerated with a larger share of the product mentioned, both in the standard metal, and still more in the things which that metal purchases. That is exactly what I should have expected, and exactly what ought to take place.

38,321. In other words, the wage earners have had the full benefit of any great improvements created by and resulting from invention and other developments?—Quite so, and I should say if that had not been so it would have been proof to me that the standard in which their wages are measured is a bad one.

Right Hon. Lord Farrer.
13 Dec. 1894

Effects of improvements in production and transporto n prices.

38,322. Would you also say that this increase in the money wages, and the still greater increase in the purchasing power of wages, is also proof that there have been causes at work in the direction of the improvement which in themselves would account for the fall of prices, independently of any question of gold?—Certainly.

38,323. That is another way of stating the same argument?—Yes, I cannot understand what we have made all these improvements in transport for, why we have made the world our own, why human ingenuity has been employed in getting a larger and a larger quantity of useful things out of the earth, if prices are not to fall.

38,324. (*Mr. Giffen.*) But that is a question of real prices that you are on now?—On both real and nominal prices.

Nominal and real prices.

38,325. Surely nominal prices are quite a different thing from real prices?—Quite a different thing from real prices, but I should expect the nominal prices of goods to fall, and I should expect the nominal prices of wages to rise, as they have done; and I should expect real wages to rise still more.

38,326. You might have a real improvement with both prices and wages rising, but wages rising more than prices?—Certainly; that is possible.

38,327. (*Mr. Lambert.*) What is the difference between real and nominal prices?—I would rather say real and nominal wages.

38,328. (*Mr. Giffen.*) I think the distinction is quite obvious; the real price is the quantity of the thing that you get for so much labour; the other is the money price?—Yes, you measure the thing against the labour.

38,329. That is the real price; the other, the money one, is the nominal one?—You may put it that way, indeed you may put it both ways, but we generally speak of price as having reference to money.

38,330. Still for the purposes of discussion we must introduce really the distinction between real and money price, and I think that all economists have made the distinction, is that not so?—Yes, only the question is then, if you are dealing with commodities, what is your standard; if it is labour, of course, that will be the case.

38,331. That becomes the standard?—If you choose to go back to the view of the old economists, or to the view which I believe is the view of some of the socialists, that labour is the ultimate standard, that is so, but that will lead you into some very strange conclusions.

38,332. (*Mr. Lambert.*) How are you going to measure prices by labour?—You will find, I think, as Mr. Giffen says, in the orthodox economists the view that if you could get an ideal standard it would be a certain amount of human labour, but you cannot get it, you know, and so you fall back upon the best standard you can get to measure value, that is gold, or whatever it may be. But the view, I think, both of older and later economists is that if you could get an ideal standard it would be a certain quantity of human effort. Of course, one of the great difficulties of that is, what sort of effort? Is it to be a physical effort, so much muscle labour; or is it to be so much brain labour; and, if so, how are you to measure brain labour?

38,333. Then the distinction becomes this: that real prices, that is, prices measured by labour, are most difficult to obtain?—I do not see how it is possible to obtain them in any statistical form.

Effects of improvements in production and transport on wages.

38,334. Therefore, real prices, according to your opinion, may be dispensed with altogether, because we cannot get at them accurately?—"Real prices" was not my phrase, and I do not think I should have used it. Mr. Giffen used it. I see what it means, but I am not sure that I should have used it. The real wages of the ordinary labourer is a much more intelligible thing, it is the purchasing power of the nominal wages of the labourer.

38,335. (*Chairman.*) Would you deduce from all the arguments you have used, and all the statistics you have brought before the Commission, that there is sufficient to account for the fall of prices in the improvements and inventions which have taken place, and the extension of production, and the opening out of

Right Hon. Lord Farrer. 13 Dec. 1894.

new countries, without entering upon the question of the scarcity of gold?—I am most decidedly of that opinion. If you will allow me for a moment to recur to a previous question, I believe that we might not come to some very curious conclusions if we were to attempt to go back to this standard of human labour. For instance, I see it pointed out in these statistics of the United States, that the prices of 1850, or 1845-50 I think it is—at any rate, about that period, and before the gold discoveries—were just about the same prices as the prices of 1880-85. No doubt, in consequence of the improvements which have taken place since that time the same amount of human effort has been able to produce, probably, twice as much of all the goods of the world. If so, prices, if their standard was a perfect one, ought to be half in 1885 what they were in 1845. I do not give that as my own conclusion at all; I only give it as a thing that has been pointed out, and as one of the curious conclusions which a too curious examination of this standard of value might lead us to.

38,336. However, without going into those rather speculative questions——That is very speculative.

38,337. You would say that the evidence we have of the rise in the money value of labour, and the still greater rise in what the labourers can buy for their wages, is proof that in invention and increased production you have the explanation of the fall of prices?—Yes.

Fall in prices of silver and of wholesale commodities.

38,338. Your conclusions of 1888 then are more than confirmed by the more recent investigations with regard to labour?—Certainly; I will say further with regard to this, that a great deal has been made of the parallelism between the fall in the price of silver and the fall in the price of wholesale commodities. There are certain diagrammatic lines contained in Sir G. Molesworth's book, and which were before us very much in the Gold and Silver Commission, shewing a curious concurrence between the fall in the price of silver, and the fall, as shown by index numbers of the prices of wholesale commodities; and that is adduced by bimetallists as a proof that silver is a good steady standard. In my opinion it is a proof that silver is a very bad standard; it proves that silver prices have not fallen as they ought to have done, having regard to all these improvements in production and transport.

Cause of fall in price of silver.

38,339. Then with regard to the question of silver, the Commission of 1888, or at all events the six members of whom you were one, were of opinion that the fall in in the gold price of silver was due to silver rather than to any causes relating to gold?—That is so. After the French and German demonetization of silver, that metal became a mere commodity in the markets of Europe, and became open to all the influences which affect an open market, whilst the same thing has not been the case with gold. The increased produce of silver from the mines is known to be very great. It is produced chiefly in America, and if not sold in America comes to Europe, London being the great market. The stock of silver in Europe upon which any increase in production operates, is comparatively small; it consists of manufactured silver, of which we do not know the amount, and of silver money circulating at its silver value which is probably not more than about 80,000,000*l*. Upon this small stock, therefore, the increase of production has a very great effect. But it may be said the East is the great market place for silver. Why did not the East take the cheapened silver and keep up its price as many persons expected it would? Simply because other commodities which the East wanted had been cheapened as much as silver, and it was therefore no more profitable to export silver to the East than to export them. It may be added that it is probable in consequence of the increasing gold remittances due from India to England, the balance of liquidation has of late years more and more against India; and that this balance has since the rupture of the bimetallic tie operated to depress the gold value of the silver rupee and to check the flow of silver to India. That was the view which was taken by the six monometallic members of the Commission, and I see no reason to depart from it.

38,340. Would you also conclude from that that if silver has fallen, as the wholesale prices above referred to indicate, that would be proof that it is a bad standard?—Certainly.

38,341. (*Mr. Giffen.*) Has silver been a bad standard in India?—I think it is a bad standard anywhere. I cannot see that it would be a good standard in India and a bad standard in England.

38,342. I am speaking of the last 20 years; have the people of India been aware that in the daily transactions of life, of their having a bad standard?—No, I do not think people are aware of a bad standard; it is a sort of thing they do not know anything about.

Right Hon. Lord Farrer. 13 Dec. 1894.

38,343. It has fulfilled all the purposes of money to them perfectly. (*Chairman.*) I suppose that would be the case with many paper currencies?—Yes, they are not in the least aware of it.

Qualities of a good standard of value.

38,344. (*Mr. Chaplin.*) What is one of the first qualities you would desire in a standard; is not stability one?—That is an extremely speculative question.

38,345. I only wanted to know your opinion?—I should say something that bears as near a proportion to human effort as you can get. An absolutely good standard is unthinkable.

38,346. Do you desire it to be as stable as you can get it?—In respect of what?

38,347. In respect of the thing it measures?—In respect of all things if I could, especially of human effort.

38,348. (*Mr. Lambert.*) But human effort has been so perfected that it produces so much more than it did years ago?—Quite so.

38,349. Therefore your standard then would be a variable one?—I must get it as good as I can; that is all I can say. A perfect standard is really unthinkable.

Effect of fall in price on long contracts.

38,350. (*Chairman.*) Now let us assume that your argument is good, namely, that the fall in gold prices is due to improvements and invention, and to the increase of commodities and production, it follows that the position of the labourer is improved; but then what is your opinion would be the effect upon long contracts?—If the fall in prices has arisen from improvements in production and transport, so that a larger quantity of things are produced with the same quantity of human effort, I do not think there is any injustice to the debtor in making him pay what is practically the larger quantity of things. If it is that gold has become more scarce, and that in consequence of gold itself becoming more scarce he has to pay a larger quantity of the articles that he produces with his industry and effort, then I think it is an injustice to him; but I do not think if the fall of prices has arisen from improvements in production and transport, that there is any injustice even to the long contract debtor.

38,351. The advantage which you have indicated resulting from this and the fall of prices, has been mainly derived by the labour-wage earning class?—Mainly.

38,352. As you go upward in society you do not find that the same advantage is derived?—No, and for one very good reason, that of these commodities which have so fallen in price each person consumes a certain quantity, and cannot consume above a certain quantity, but what the richer people spend is very largely spent in wages and services; and those have risen.

38,353. The price of all services and labour having increased, the income of the better class does not *pro tanto* go so far?—It does not go so far.

38,354. A man gains so far as he is a consumer of the simpler products, but when he comes to expend his money upon labour to supply luxuries and so forth, he is rather worse off than before, and therefore his income, as a whole, does not go any further than it did?—Quite so.

38,355. Therefore these debtors that you speak of, and who probably consist of the leisured classes, do not in fact derive any benefit from the fall in prices?—No, of course the mortgagor of land—there is no doubt about it whatever—suffers terribly. I will not deny that for a moment.

38,356. (*Mr. Chaplin.*) Every debtor suffers, does he not?—What I think he suffers from is from the competition of all the rest of the world which we have brought into competition with him.

38,357. (*Chairman.*) He suffers really from the fall of rent?—That is the way in which it affects him.

38,358. (*Mr. Chaplin.*) If he is the owner of land and cultivates it himself, he does not suffer then, I suppose, from a fall of rent?—It depends on the circumstances. If he is a peasant owner consuming all that he cultivates, and consuming a great deal that he buys, he would not suffer so much; but if he is an owner who cultivates and has to pay wages, of

Right Hon. Lord Farrer.

13 Dec. 1894.

course he suffers; his produce sells for less, and he has to pay higher wages.

38,359. (*Chairman.*) Have your opinions been confirmed by what has happened since the Commission of 1888 reported?—Yes, a great deal. The information we have had about the remuneration of labour is very much fuller than it was at that time.

38,360. Then since that period the production of gold has enormously increased?—It has quite enormously increased. We will come to that presently.

Quantative theory of prices.

38,361. Then we now come to our theory of prices?—Now we come to a matter of considerable obscurity; at least, I find it very difficult. I will say what occurs to me on the subject of what people call the quantitative theory of prices. I think there can be no sort of doubt that if you have a certain metal, gold, and there is a certain supply of, and a certain demand for, that metal, the value of that metal depends upon the aggregate supply and the aggregate demand. If the demand increases faster than the supply the value of that metal rises as against everything else; if the supply increases faster than the demand the value of that metal falls as against everything else.

38,362. Is that what is known as the quantitative theory?—I do not think that is what people generally mean, but I am not bound myself to put a meaning upon the expressions that people use. If I were to venture to state what people generally mean by the quantitative theory, it would be to the effect that the need for the quantity of gold used as currency increases in proportion to population, or to commodities, or to business. If this is what they mean they are quite wrong. I think they confound gold as the standard with gold as the medium of exchange, which are two very different things. Gold is our standard of value and has been our standard of value now for a couple of centuries. Gold also is a medium of exchange, but it is becoming less and less a medium of exchange; it is more and more simply a standard of value, and less and less the medium with which people pay for what they buy.

Distinction between gold as a standard of value and as medium of exchange.

38,363. (*Mr. Chaplin.*) You explain it, I understand, as being the measure of value?—The measure of value, and for that purpose the sovereign that I have in my pocket depends for its value upon the aggregate supply and demand of gold in the world; and the sovereign is the measure of value. The point that I shall come to presently is, that the gold sovereign is not the ordinary medium of exchange. If that is so, then it becomes very important to see what is the aggregate supply of gold in the world, and the last and best statistic I can get upon that subject is from the last report of the Director of the United States Mint published in 1894. There is a table contained in the appendix to that report in which he gives the production of gold and silver in the world since the discovery of America, which I will put in (*see* App. XI.). He gives the annual averages for the earlier years, and from 1886 he gives the production in each year. I have had the value of the gold production turned from dollars as given in his report, into pounds sterling. The earlier figures, I believe, were from Dr. Soetbeer, whom everybody admits to be an excellent authority, on these points. The aggregate supply of gold to the world from 1493 to 1800, or upwards of 300 years, amounted—I will give it you in round numbers—to about 500 million pounds; for 40 years, that is from 1800 to 1840, the supply of gold amounted to about 87 millions; from 1840 to 1870, a period of 30 years, the supply of gold amounted to over 600 millions, and from 1870 to 1893, a period of 23 years, the supply of gold amounted to about 500 millions and a half. In considering this supply you must remember that gold is not like an ordinary commodity, consumed as fast as it is produced. Gold accumulates; there is a certain quantity of waste—I do not know, and I do not believe anybody knows what the amount of waste is; it must be something considerable, but still it is nothing like the quantity that is accumulated. Consequently this stock of gold goes on accumulating, and when you speak of the demand against it you have to speak of the demand for the time being, as against a perpetually accumulating stock, not against the supply of each year, but against a perpetually accumulating stock. If you look at those figures you will see that they are very curious indeed. During the first 40 years of this century you had not as much as 100 millions added to the gold supply of the world.

Demand and supply of gold.

38,364. (*Mr. Elton.*) What was the total stock?—The total stock supplied since the discovery of America—I do not suppose anybody can even guess what there was before that—but the total stock supplied since, without allowing for waste, according to these figures, is 1,725 millions odd.

38,365. (*Mr. Chaplin.*) That is, now?—Up to the present time; that takes in 1893.

38,366. (*Mr. Elton.*) You gave us the figure down to 1800—from 1493 to 1800?—From 1493 to 1800 it was roughly 500 millions.

38,367. (*Chairman.*) From 1800 to 1840, which is 40 years, it was 87 millions, and from 1840 to 1870 it was upwards of 600 millions, and from 1870 to 1893, 550 millions?—Yes.

38,368. (*Mr. Lambert.*) What are these figures—sovereigns, or ounces, or what?—Sovereigns.

38,369. (*Chairman.*) These have been translated by you from dollars into sovereigns?—I have had them converted into sovereigns.

38,370. (*Mr. Giffen.*) At what rate did you convert the dollars—4*s.*?—I did not convert them. I got them converted by Mr. Chalmers, of the Treasury. He converted them at the rate of $4·867 to the £ sterling, which is the gold par.

Amount of gold used in the arts.

38,371. (*Chairman.*) Does this make no allowance for the amount which has been devoted to the arts?—No. Against this supply you have to set the amount which is used for the arts, the amount which is used for hoarding, the amount of waste, and finally the monetary demand. I have not attempted to give the figures either of waste or of the amount hoarded, or of the amount used in the arts, because we most of us on the Gold and Silver Commission came to the conclusion that the figures given for those were little more than guesses. You will find in the reports of the Director of the Mint and elsewhere the guesses which people have made, but they are not figures which in my opinion can be relied upon at all.

38,372. (*Mr. Giffen.*) Still there is a very large sum used in the arts?—Yes, no doubt a very large sum.

38,373. Although there may be a doubt as to the exact sum, there is no doubt a very large sum?—Yes, a very large sum, I quite admit that at once, but I do not know that the amount used in the arts goes on accumulating in the same way that the supply goes on accumulating. I wish further to observe with regard to both what is used in the arts, and what is hoarded that you cannot, I think, look upon that amount as taken away from the whole stock of gold, which affects its value in the market. Here is my watch, the gold employed in that affects the value of gold in the whole world. If I were starving I should sell my watch and chain. Again, take the gold hoarded. Take the gold, for instance, in India, which has always been treated—I have been rather surprised at it—by statisticians in the colonies as entirely lost to the use of the world. What do we see of late years, why, that the gold is coming back from India. Given sufficient temptation and gold will come out of those hoards and come back. I cannot tell you what the reason is, nor why it has happened at this moment.

Absorption of gold by India.

38,374. Has that not always been the case that every now and again a little gold has come out of India, but that on the balance India absorbs gold very much?—It has always been treated by all statisticians as a fact that India is a sort of sponge absorbing both gold and silver.

38,375. I say, generally, though a little gold comes out of India at different times, it is quite true it is a sponge?—There is no doubt India has been an immense absorbent of gold, but it is the fact since the closure of the mints, for what reason I cannot tell, that a great deal of gold has come back. The current is reversed for the time being; whether that current will continue to be reversed I do not know.

38,376. It has been reversed before on different occasions?—Yes, I think it has for a short time. On the whole the great current of gold, the great balance has been to India, there is no doubt about that.

38,377. (*Mr. Chaplin.*) Are the hoards in India included in the total estimate you gave us of 1,725 millions?—I have given you the whole supply since the discovery of America, so that the hoards in India will to a large extent have come out of that; we do not know what was hoarded there before, you know. I may put it to you in this way, that the amount which has gone to India, and which you see by our statistics has

Right Hon. Lord Farrer.

13 Dec. 1894.

gone to India, and has remained there, has come out of this supply.

Demand for and supply of gold.

38,378. (*Chairman.*) Your statistics do not give the stock which existed previous to this production that you speak of, that is previous to 1490?—No, and I suppose it would be very much guess work before that date.

38,379. (*Mr. Channing.*) Do these figures include the gold in the arts?—They include the whole supply of gold, so that out of that supply whatever has been used in the arts must have come.

Supply of silver.

38,380. (*Mr. Dalton.*) Is it possible to give similar figures for the supply of silver from the beginning?—I have given you here the supply of silver, but I have not had it turned into pounds. I have put in this table; in the report of the Director of the United States Mint it is converted into dollars, both at currency and market values, but I thought that would only be confusing, so I have not given it. It is very easy to do it if you wish to have it. You will understand that the Americans coin their silver dollar, and that it is current at a gold value.

Annual average supply of gold.

38,381. (*Mr. Chaplin.*) Have you got the amount on both?—It is to be found in the report of the Director of the Mint, and if you wish to have it it could be put in. I think it would be quite worth the while of the Commission to have that report of the Director of the Mint. I should like, before I hand it in, to point out what the average annual value by decades has been since 1800; it is very remarkable. Beginning with the century down to 1810 the annual average supply was two millions and a half; in the next decade the annual average was a million and a half; in the next decade to that the annual average was about two millions; in the next decade nearly three millions; and in the next decade, going down to 1850, it rises to seven millions and a half.

38,382. (*Mr. Giffen.*) That was practically before the Australian gold discoveries?—Yes, but a little had just began to come in, and raised it a little I think. Then for the next decade it was 27 millions; from 1861 to 1865 it was 26 millions; from 1871 to 1875 it was 23 millions and a half; in the decade 1881 to 1890 it was nearly 23 millions; and for the last three years the annual average has been 29 millions and a half, or nearly 30 millions.

38,383. (*Mr. Dalton.*) Is that in money value?—Yes, in sovereigns.

Supply of silver.

38,384. (*Mr. Chaplin.*) Perhaps you can tell me this: I think in the estimates made before the Gold and Silver Commission, that the great aggregate mass of silver was estimated at something like 1,900 millions sterling, do you remember that; if we could get a rough idea of the whole amount of silver in the same way that you have given it of gold it would be a very great assistance to us?—I am going to put in an extract from the report of the Director of the Mint which I think will give you something of that kind. He makes the value of the silver produced, if I remember right, about equal to the value of the gold.

38,385. The existing mass?—Yes.

38,386. (*Mr. Giffen.*) Is that at the old ratio of 15½ to 1?—It is coining value, its value as coined into United States dollars.

38,387. (*Mr. Dalton.*) At the market value from time to time, or at the present market value?—Not the London market value, but the coining value in the United States.

38,388. Then the actual production of silver must have increased enormously of late years?—Quite enormously, from an annual average of about 30 millions of ounces in 1856, 60 to 160 millions of ounces in 1893.

38,389. Although the value has fallen off?—Yes. The increase in quantity has been steady since 1860, though as we know the gold value per ounce has constantly decreased since 1870–1873, and is now only half what it was then.

38,390. (*Mr. Channing.*) Do you say of this great mass of silver that the aggregate supply and the aggregate demand, as you said in the case of gold, is what regulates its value?—I say with regard to the silver as with regard to everything else, that the aggregate supply as compared with the aggregate demand is what regulates the market value.

38,391. Of the whole?—Yes, of the whole silver, undoubtedly.

38,392. (*Chairman.*) On the assumption that gold has appreciated to the extent of 50 per cent., as the bimetallists say would you expect that large quantities of gold would be withdrawn from hoards and from ornaments?—I should expect so.

Right Hon. Lord Farrer.

13 Dec. 1894.

Effect of appreciation of gold on hoards and on gold used in arts.

38,393. And that the demand for the arts would be greatly reduced?—I should expect so. I think with regard to the use in the arts, though it is true that a great many more people wear gold ornaments and so on, the tendency of civilised countries is rather to use for big things a smaller amount of the precious metals. I will not trouble the Commission with the general observations of the Directors of the United States Mint upon the gold and silver supply. There are, however, some passages that are so important that I should like to read them:—"The world's output of gold in 1893 was "the largest in history, amounting as it did to "234,006 kilograms of the value in round numbers "of 31,954,387*l.* The highest previous yield of "gold was in the period 1856–1860 when the "production reached an average weight per annum "according to Dr. Soetbeer of 201,750 kilograms fine, and "an average yearly value of 27,526,197*l.* The output of "gold therefore in 1893 was 16·08 per cent. greater than "the annual average of the period of the greatest pro-"ductiveness of the Californian and Australian gold "mines. A still more notable fact, and one which will be a "matter of surprise to the world of finance—as attention "is now for the first time called to it—is that the value "of the gold product of the world in 1893 was only 8·77 "per cent. less than the average aggregate value of the "gold and silver product of the world in 1861–1865. Dr. "Soetbeer estimates the value of the average total out-"put of gold and silver in the world in 1861–65 at "35,026,379*l.* The value of the world's production of "gold in 1893 alone was, as remarked above, in round "numbers 31,954,387*l.*, a difference of 3,071,992*l.* In other "words, the value of the yield of the gold mines of the "world in 1893 was only 3,071,992*l.* less than the value "of the average yield of both the gold and silver mines "of the world in 1861–85. The average value of both "the gold and silver product of the world for the "period of eight years, 1866–73, which just preceded "the beginning of the depreciation of silver was "39,209,164*l.*, a difference between the value of the "average total of the gold and silver production of "these years, and that of the gold product of 1893 "alone of only 7,254,777*l.* If the production of gold in "1894 exceeds that of 1893 by 22·7 per cent., it "will reach in value the world's production of both "metals (39,209,164*l.*) 20 years ago. This is a "most momentous fact, and one which must have "much influence on the monetary policy of all "civilised states in the future. The great proba-"bility is that the value of the world's output of gold "in 1894 will equal that of both metals in the years "1861–65, and in 1895 or 1896, that of the years imme-"diately preceding the beginning of the depreciation "of silver *i.e.*, the average of 1867–73 inclusive. It "may be predicted with certainty that it will be "greater in 1897 than such average. Of the 3,071,995*l.* "of gold needed to bring the value of the yield of the "gold mines of the world in 1894 up to that of the "world's average output of both gold and silver in "1861–65, it is even now demonstrable that South "Africa alone will furnish at least 1,761,061*l.*, leaving "an excess of only 1,512,619*l.* to be supplied by other "countries. From what has been said it is plain that "in 1894 the value of the output of gold alone will "very nearly equal that of the yield of the world's "mines of both gold and silver in 1861–65, and a little "later, that of the total production of both metals "before the demonetisation or depreciation of silver. "Value, not weight, is the thing to be chiefly con-"sidered in the production of gold and silver viewed "from a monetary point of view." Then he gives a table showing that, and goes on to say: "If the gold "output of the mines of the world in 1893 found its "way to the mints of the civilised countries of the "earth in the same proportion as to value that both "gold and silver did in 1866–1873, the fact that the "value of the gold output in the near future will pro-"bably equal the value of the average output of both "gold and silver in the years immediately preceding "the beginning of the depreciation of silver, must "have an important bearing on the question of the "necessity of international bimetallism. It cannot, "however, be admitted to be decisive of such necessity."

38,394. (*Mr. Chaplin.*) Who is the writer of this report?—Mr. Preston the Director of the United States

Right Hon. Lord Farrer.

13 Dec. 1894.

Mint. I believe he is the best statistical authority on the production of gold and silver.

38,395. (*Chairman.*) The figures you have quoted show that since 1888 there has been a rapidly rising production of gold?—Yes.

Effect of increased production and supply of gold on prices.

38,396. Especially during the last three years, and that there is every indication that that increase will be carried still further?—Yes. Before I leave this point I will put in these extracts from his Report. They contain, *inter alia*, some interesting observations upon the accumulations which Russia has made (*see* Appendix XII.).

38,397. On the assumption, then, that the fall of prices up to 1888 was due to the scarcity of gold, one would have expected that from 1888 down to the present time there would be a reverse action, and that prices would have tended to rise?—Certainly.

38,398. But the contrary is the case?—They have continued to fall down to the present moment.

38,399. Therefore, what has taken place in the interval, and especially in the last three years, seems to be inconsistent with the theory that the fall of price is due to the scarcity of gold?—Certainly.

38,400. On the want of the production of gold?—Certainly.

38,401. (*Mr. Giffen.*) How long did it take for the Californian or Australian discoveries of gold to effect a rise of prices?—I cannot tell you, but I can tell you—whether it is the effect of the gold discoveries or not—that you have already in the banks a plethora of gold, and that that has had no effect in raising prices.

38,402. (*Chairman.*) There is a greater accumulation of gold at the present time in the principal banks of Europe available for circulation?—Not only available, but as much in circulation as it ever will be or can be.

38,403. (*Mr. Giffen.*) But usually in these cases it takes some time before the rise of prices comes?—Yes; but I suspect the rise of prices is due to something very different. It is not due to the gold. If the gold came into the banks at a sanguine time, when people were ready for any undertakings, it would be rapidly absorbed, and it would probably assist in promoting the rise of prices; but coming in as it does in a period of depression it is so much useless dross, or of no more use than any other deposits, and has no effect whatever upon prices.

Demand for and supply of gold since 1870.

38,404. (*Chairman.*) Tending, therefore, to show that there is no immediate connexion, though, of course, there is an ultimate connexion, between the increased or reduced production of gold and the rise and fall of prices?—Certainly. In connexion with those figures of this enormous supply of gold, and this enormous accumulation of the stock of gold, I want to call attention to the figures upon which bimetallists rely to show that the demand for gold in the year 1870, and the following years, was so great as to cause gold to be scarce and to lower prices. I have told you that 600 millions were added to the stock of gold during the period 1840 to 1870. and the supply continued accumulating at a very high figure afterwards. The whole new demands for currency purposes, which are the demands which the bimetallists rely upon, amount to very much less than this. I cannot tell you with any precision what they were, and the Commission did not put any definite figure upon them. But they had before them various estimates of the new demand. Mr. Giffen's, which I think is the largest estimate, was about 200 millions; he has mentioned it before this Commission.

38,405. (*Mr. Giffen.*) I do not think I said that was the demand for currency purposes. I think I said that the aggregate new demands for all purposes was 200 millions?—Yes, the new demands—what Germany added to the demand, what France added, and what the United States added; Professor Erwin Nassé puts these demands at 140 millions, and Sir Guilford Molesworth, who has received the prize for the best bimetallic essay, puts it, as far as I understand his figures, at about 120 or 130 millions. It is extremely uncertain, but even taking the largest of those figures, it is a very small demand as compared with the stock, and with the addition to the supply which had taken place since 1850. It seems, and especially to me, looking at these figures of supply, the great increase of supply since 1850 as compared with previous times, that if there were any truth in this theory of the scarcity of gold affecting prices, prices ought, before 1850, to have been down at zero, and to have risen in the subsequent time to some enormous figure. That is, so far as gold as a standard is concerned. I have not been dealing with it hitherto as a medium of exchange.

Right Hon. Lord Farrer.

13 Dec. 1894.

Gold as a medium of exchange.

38,406. Now will you consider it as a medium of exchange?—To repeat, I quite admit the quantitative theory as far as the aggregate supply and the aggregate demand on the stock of gold in the world is concerned. If our standard metal is in greater demand in proportion to the supply the standard will rise, the value of your individual sovereign will rise, and the value of everything measured in it will rise. But what people generally are thinking of is of the other function that money fulfils, namely, that of a medium exchange. Here I deny altogether that there is any relation whatever between the quantity of gold and prices. Gold is still our standard; it is, to a very small extent indeed, our medium of exchange. As a matter of fact we all know, especially in wholesale transactions, that scarcely any gold passes at all. Daily more and more of our transactions, even our retail transactions, are effected by means of cheques and bankers' money. I observe in all the bimetallist writings a great confusion between money and gold money. I observe in Sir William Houldsworth's reply to our Chairman's speech the other day, that he talks about the quantity of money; but he does not seem to be in the least aware that there is all the distinction in the world between what is known in the City of London and in common parlance as "money" and gold. The demand for money is not a demand for gold. You may prove that in a great many different ways. The gold used as money varies greatly in different countries. In the most advanced countries there is least of it in proportion to the trade. You will find that the gold which is actually used by the banks does not increase at all in proportion with the trade and the exchanges. They are effected by bankers' money and the common phraseology of the newspapers, and of the City, is really much more accurate than that of the economists, who attempt to treat money as gold.

38,407. (*Mr. Giffen.*) Then you do not create an unlimited demand for the metal which you make standard money by making it a standard?—Certainly not; most undoubtedly not.

Effect of growth of credit on demand for gold as money.

38,408. (*Chairman.*) Then I presume you would say, apart from any economies effected in the use of gold by the increase of bills, cheques, and so forth, that the increased facilities of transit have economised its use in international arrangements?—Enormously. Of course bills of exchange had this effect in the old times, and telegraphic transfers now do it still more. That is why it is so difficult to apply the reasoning of the older economists or of different times to the present time. The growth of credit, as a medium of exchange, has been so enormous in recent times.

38,409. (*Mr. Giffen.*) Are securities as well as bills of exchange used in the same way?—Securities too; you settle your balances with securities. If it were thought necessary I could easily put my hand upon figures showing how the different nations use different quantities of gold having no relation whatever to the quantity of their business; and how at different times different quantities of gold are used having no relation whatever to the amount of their business or their population, but I do not know that it is necessary.

38,410. (*Chairman.*) I think you have some figures showing the use of gold in the economy of Canada and showing how with very largely increased transactions they have been able to use the same amount of gold?—Yes. You will find some very interesting information upon the subject in paragraphs 67 to 96 of the Report of Lord Herschell's Committee upon the Indian question, which gives a short account of the principal currencies of the world. I certainly was astonished myself to find with how little gold a great deal of the business of the world is done, and how very little relation the quantity of specie has to business at all. Canada is an extremely good instance of what money and what currency is. It is a sort of pocket instance. I do not give it as the best currency in the world, but I believe it is a currency about which there has never been any difficulty. It has been always a perfectly sound currency. Mr. Chalmers, of the Treasury, who has written a book upon the subject of these colonial currencies, and is perhaps the best authority we could have upon the subject, has prepared me this Table, and I think it is an extremely interesting one (*see* Appendix XIII.). It gives an analysis of the

Right Hon. Lord Farrer.

13 Dec. 1894.

Proportion of specie to currency used in Canada.

whole of the currency of Canada, and it gives the population. The currency consists in the first place of bank notes issued by the banks. Then it consists of bank notes issued by the Government, the Government holding a certain quantity of specie as against those notes, and the banks also holding a certain amount of specie though not much, and also holding as security for their note issue, a certain quantity of the Government notes. Besides this, and over and above all this, which one may call the active currency, there is a large quantity, and a very much larger quantity, of bankers' money, that is bankers' liabilities to the public, the deposits held by them upon which persons can draw cheques to pay their debts with. Taking the whole of the bank deposits, that is the whole of the bankers money, money in the ordinary sense of the word, the City sense of the word, the quantity is about 240 millions of dollars. The total specie that is held against that varies, but was about, in the last year 15½ million dollars, and in the year before that 13¼ million dollars.

38,411. (*Mr. Giffen.*) Do not the banks in Canada hold their specie reserves in New York?—I believe that the specie reserve of the Government is held by the Government in Canada. The notes of the banks are covered by and redeemable in Dominion notes; and these, no doubt, are held by the banks in Canada. They may, for anything I know, hold securities and credits in New York.

38,412. No, it is held in New York?—It may be held in New York. They may possibly hold credits there; there is no gold circulating in Canada at all—absolutely none. Wherever the specie reserve is, it is at the disposition of the Government or of Canada, or of the banks so far as it is theirs.

38,413. (*Mr. Everett.*) Canada is a gold standard country, is it not?—Yes, a gold standard—the gold American dollar is the standard.

38,414. But yet there are no gold dollars?—There are no gold dollars.

38,415. (*Mr. Giffen.*) I do not see the difference between Canada and Scotland?—I daresay Scotland is just as good an instance, but I do not happen to have the figures for Scotland; there is, I think, a difference. The reserve of the banks consist chiefly of Dominion notes, which are legal tender.

38,416. Do not the Scotch banks keep their reserves in London just as the Canadian banks keep their reserves in New York?—I believe that the Canadian banks have large credits or a large amount of securities in New York on which they can draw. But their reserves are largely Dominion notes.

38,417. (*Chairman.*) Your figures would tend to show that in a progressive community with largely increased transactions the same amount of gold suffices?—The interesting point to me is this: in the first place, the extraordinarily small proportion of specie to money; it is at the present time 6·51 per cent.

38,418. What was it a few years ago?—If you go back to 1871 it was 13·20 per cent., so that during that period, while the actual money has increased by about 150 per cent., the proportion of the specie to the money—to the real currency of the country—has diminished by one half.

38,419. (*Mr. Everett.*) Are those notes convertible at will by the bearer?—They are all convertible.

38,420. At will?—All the notes are convertible; there is no forced currency at all.

38,421. As a matter of fact the people prefer the note to the gold it represents?—It is not only the note. The note seems to be a sort of active currency for small purposes, but the real currency in which large transactions are transacted—the real medium of exchange—is the banker's money used by means of cheques upon the banker. It is rather a curious thing, pointed out by Mr. Chalmers in his book on Colonial currencies that all the notes and specie which are current for small purposes, for smaller dealings in Canada, come to about 2*l.* per head of the population; and the proportion is just the same in Australia. That is rather curious; it shows that the small currency which people are using for their daily transactions is the same per head in both Colonies.

38,422. (*Chairman.*) The illustration tends to show that in a progressive community, rapidly increasing in transactions, the economy effected in the monetary arrangements is such that no increased supply of gold is practically necessary?—On the contrary.

38,423. A very small increase?—On the contrary, even less.

Right Hon. Lord Farrer.

13 Dec. 1894.

38,424. The proportion is less and the actual money is less?—It is less than it was in 1870. If you poured into Canada at this moment 20 millions of gold it would not stay there; it would be of no use to them; it would probably drain away to New York, and would not alter prices at all.

38,425. (*Mr. Giffen.*) But have you considered the question of the balances which the banks of Canada keep in New York?—No, I have not; but I do not see how that affects the question of the actual use of gold in Canada.

38,426. (*Chairman*). Supposing that to be the case, you might presume that there would be the same proportion at different periods?—Yes, that would probably be so. At any rate, I do not think that that makes any difference to my argument. In all banking systems there are means of procuring as well as of holding gold.

Reserve of the Bank of England.

38,427. A very small amount of reserve of gold is necessary for the purpose of carrying out the transactions of the country?—Yes, and I put in the case of Canada as an illustration. And I call your attention to what I will not read—to the accounts of the different currencies of the world in the Report of Lord Herschell's Committee. I should like to put in some figures with respect to bankers' money in this country, which, though they are not complete or exhaustive, yet do tell a tale. They are contained in a return which was an appendix to my little book on "Free Trade *versus* Fair Trade," containing the figures showing the progress of the country for a number of years. I have got a number of them here, and I can hand them round to the Commission (*see* Appendix XIV.). I should like to call your attention to two columns in it. The reason I put in the Canada figures was that the whole account of the currency can be put into a neat and compact form. I have no figures of the kind for this country. But there are some figures in this return which are interesting. If you will look at the column headed "London Bankers' Clearing House," and the column headed "Bank of England Reserve" you will see that we have the Bankers Clearing House figures from 1868, and the reserve of the Bank of England from 1844. The figure for the Bank of England is only a figure taken at the end of the year, and therefore it tells very imperfectly what the reserve at the Bank of England is. The banking reserve of the Bank of England is the reserve of the banker's bank, the reserve in fact upon which the whole business of the country is conducted. It consists either of gold or of notes which are secured as we know under the Act of 1844 either by the debt of the Government to the bank or by gold in the Issue Department of the Bank of England. If you look at the amount of the reserve you will see how very little that has increased even from the year 1844, whilst it varies from time to time. It goes down sometimes to seven millions and rises to 15 millions, but does not increase with the increase of business. At the present time it is unusually high as we know; I do not know what it is just at this present moment, but a little while ago it was something like 30 millions I think.

38,428. (*Mr. Giffen.*) The reserve?—I forget the exact figure, but it was something very high indeed. You will see how in spite of the enormous increase of population and the enormous increase of trade, as shown in other statistics in that paper, how very little reserve of the Bank of England, upon which the whole business of the country is conducted, has increased. You will find an explanation of that to some extent in the figures of the Bankers' Clearing House. Those figures began in 1868, and they are not perfect figures at all. I daresay much is not included in the earlier returns which has been included in the later returns; other banks have come in. You will observe that between 1868 and 1894 the transactions of the Bankers' Clearing House have doubled—they are enormous in amount, and, as I say, they have doubled in quantity. The figures of the Bankers' Clearing House, of course, do not show you what are the bankers' deposits, which are the real money of the country, the real circulating medium of the country; but they show you the transactions, and, therefore, are some sort of indication of the business done through the medium of that money. You will see how large they are, and how enormously they increase with the business of the country, while the reserve—the specie of the Bank of England, which is the foundation of the whole—does not increase at all from year to year.

Right Hon. Lord Farrer.

13 Dec. 1894.

38,429. There has been very little increase in the Bankers' Clearing House since about 1879?—That is so, and as we know business has been contracted, especially business on the Stock Exchange.

38,430. (*Chairman.*) That, again, is another illustration of the very small amount of gold that is necessary for a country which has a good standard and a good monetary system?—Yes.

Effect of credit money on prices.

38,431. Would you deduce from that that the amount of credit money, the money of the City, is money which has mainly to do with prices?—That is the money which has to do with prices.

38,432. And this money is capable of great expansion and contraction?—Yes, and the value of the system is that it expands with the demand for it. It depends ultimately upon gold, and no doubt the supply of gold has some effect upon it through the medium of the reserves in the banks and the rate of discount, but it is very remote, uncertain, and difficult to ascertain.

38,433. And probably whether it is more or less within two or three years affects it very little?—Very little indeed. The state of the market, the state of business is the thing which practically affects the demand for money in the market. I should think if there was a deficient supply of gold at a period when there was a great demand for money that the gold would then become very valuable. Suppose there was a boom to-morrow, and that there was a great demand for all the money that the City could supply, then the additional quantity of gold that might be supplied in consequence of an increased supply of gold elsewhere would probably have a considerably influence in furthering and helping that boom. On the other hand, a great quantity of gold coming in at a period like the present, when there is no demand for money, has no effect at all; there it lies, it is a drug; in fact, each gold sovereign is of no more value there than each £ of credit money which there is to the credit of the banks; and any increase that it may make to the quantity of money which affects prices is to be measured, not by the increase in the quantity of gold in the bank, but by the increase in the aggregate quantity of gold and of credit money. It is a proportion which it is impossible to trace out, but one sees what the reason is, and why it is that the gold which comes into the bank has so little effect at present in raising prices.

38,434. Then you would also conclude from these arguments that there is no evidence of any increased scarcity of gold since 1870?—I think there is no evidence whatever. So far as I can judge, looking into the tables of the rates of discount given in all the books, or still more from a very elaborate diagram published by Bates and Hendy, of Walbrook, there is not the least evidence that the rate of discount has been higher, or has fluctuated more, since 1870 than it did before; and it is only through the rate of discount that we could tell whether there was a great demand for gold or not.

38,435. There is no proof that the demand for gold has increased out of proportion to the supply?—No proof whatever.

38,436. Or that the fall in the gold prices of wholesale goods which has taken place is due to the scarcity of gold?—Quite so; that is the conclusion to which I come.

Effect of fall in prices on the landed interest.

38,437. I presume that it is quite consistent with this view that the landed interest in this country have suffered severely by the fall of prices in agricultural products?—I admit it entirely, but I think that is due to the competition of the rest of the world, and not to the standard.

38,438. And was only to be expected when the world was brought into competition?—Quite so.

38,439. Coupled with these very great improvements in inventions during the last 20 years?—Yes, it was to be expected. I remember very well the prophecies at the time of the repeal of the Corn Laws; most fortunately those prophecies did not take effect nearly so soon as people expected, and the land had a very good time.

38,440. (*Mr. Chaplin.*) What was it which prevented them taking effect, in your opinion, so soon as was expected?—The general prosperity of the country owing to free trade, which enabled our manufacturers to export very largely, and consequently made an excellent market for agricultural products.

Effect on prices of discoveries of gold.

38,441. (*Mr. Giffen.*) Was there not a rise of prices consequent on the discoveries of gold immediately after Free Trade?—I contend myself that the discoveries of gold had very little to do with it.

Right Hon. Lord Farrer.

13 Dec. 1894.

38,442. You disagree altogether with great authorities like Jevons and Newmarch, then?—I do not think Newmarch thought that.

38,443. You differ from Mr. Thompson Hankey?—I think that the gold in California and Australia had a great deal to do with the expansion of the commerce of the world, as it attracted a great many persons to those countries. It may have some effect through the gold that was found there, but it did a great deal more by causing those countries to be developed.

38,444. (*Mr. Chaplin.*) Indirectly I understand you to admit that they did have a great effect on prices?—I think they had an effect on business and trade, and through business, as I say, on prices. Just in the same way it is quite possible that you may have a great boom and development of trade in consequence of the present African discoveries, and you may have a large increase of exports to Africa, and you may have Africa largely developed; but not so much in consequence of the extra supply of gold, as because it induces a great number of persons to go and develope a new country.

38,445. (*Mr. Giffen.*) Have you read a letter of Mr. Thompson Hankey in the "Colonist" of June 1872, dealing with the abundance of gold at that time?—I not remember it.

38,446. I mention it because it indicates the state of things at the time amongst monometallists and leading economists as to what the effect of the gold discoveries was?—There is no doubt that there was a large body of opinion which thought it would have a tremendous effect; indeed, people were in a panic about it, but then Newmarch did not believe in that panic at all. I would illustrate what I believe to have been the chief effect of the Australian and Californian gold discoveries by the old classical story of the farmer, who told his sons that there was a treasure concealed in his field. He told them to go and dig for it. They did go and dig for it, and their farm became very prosperous.

38,447. (*Chairman.*) On this subject I believe you desire to put in some pages from Taussig's Silver Situation in the United States?—Yes. He expresses what I wish to express so much better than I could do it myself that I should like to put in Chapter 7 of his book for the use of the Commission (*see* Appendix XV.). Any person who is interested in this subject I would strongly recommend to read Professor Taussig's book on the Silver Situation in the United States. It is most instructive reading.

Inconvenience in the break of gauge between gold and silver.

38,448. Now will you pass on to another subject, namely, the evil which the bimetallists allege and endeavour to cure, the inconvenience in the break of gauge between gold and silver?—I quite agree that there is an inconvenience, but I think it has been exaggerated.

38,449. You deny that the effects which have been attributed to it are due to it?—I think there has been a great misapprehension about what the effect of the fall in silver has upon trade. I do not believe it has anything like the effect that has been attributed to it.

Difficulty Indian Government due to diverging standards.

38,450. Do you admit that there is a certain inconvenience from there being a double standard?—I admit that there is a very great inconvenience. What is the meaning of the present difficulty which the Government of India is in? It is that they have difficulty in paying their gold debt. They collect their taxes in silver, and they have to pay a gold debt, and their silver is not worth as much in gold as it used to be. If that is due, as the bimetallists think, to a rise in the value of gold, that is an extremely serious thing for India and for everybody in India, because they have to pay so much more than they agreed to pay; but, if on the contrary, it is due to the fall in silver, the difficulty and inconvenience is of a different kind. In that case the Indian Government obtain from the ryot the same tax in silver that they got before, but the tax is really worth less, measured in produce, than it would have been if there had not been the fall in silver. They have to pay in gold, and they have to find the difference, and the consequence is that they have to do all sorts of things which are extremely injurious to the inhabitants of India. They have to stop public works; they have to put on import duties; they have in that way to pinch their subjects in all kinds of ways which are extremely unsatisfactory, and in that way or in some such way as that, I do not pretend to see it altogether, but in some such way as that, the matter gets adjusted. It is no

Right Hon. Lord Farrer.
13 Dec. 1894.

advantage to the Indian at all. Some persons who are engaged in export may make a profit by it; but to the producer in the country the thing is really a disturbance and an evil. Anything that is imported from this country he has to pay more for. It so happens that in India the Indian Government themselves are the greatest importers, and they have to pay more; and then they have to find more taxes with which to pay, and they have a very great difficulty in finding them.

38,451. (*Mr. Chaplin.*) As a matter of fact what does the producer of wheat in India buy of imported produce?—He buys some cotton and probably some other things, but I do not suppose he buys very much directly; indirectly he buys a great deal. He depends for instance, upon the railways and the development of the railways to carry his goods to the market. The railways are made with imported material and with imported English brains, and for all that, money has to be paid. The Government of India which keeps the peace there has to pay for English brains with which to make improvements and to keep the peace, and anything which reduces the income of the Government of India injures the ryot by preventing the improvements which the Government of India would otherwise make.

38,452. (*Mr. Giffen.*) Is the community of India any worse off as regards its gold debt because its money is silver, than the community of Australia which has gold money?—No; the Government of India is worse off, but I do not think the community is any worse off.

38,453. It is in exactly the same position?—Yes. The Government of India is worse off in any case, because it receives in silver and pays in gold. If gold has become dearer and scarcer India as a whole has to pay a larger amount of produce in order to pay her gold debt, without having any larger amount of produce out of which to pay it.

38,454. So has Australia, surely?—I believe that you are perfectly right in both cases. The question whether the debtor country is a sufferer or not depends upon whether the rise in price is due to the scarcity of gold or to improvement in production.

38,455. That is not my point; but I mean that it affects the community of India and the community of Australia exactly alike, not the Government but the community?—Yes. I believe I agree with you entirely. But of course there may be in other respects a great difference in the state of the two communities. The Government of India plays so much larger a part in the whole concern than the Government in Australia does.

38,456. As far as the burden of the debt is concerned, and the produce out of which is to be paid, it does not matter whether you have silver for your money or gold for your money?—No, I do not think it does.

38,457. (*Chairman.*) Do you admit that the double standard causes some inconvenience, and possibly loss to traders of the two countries when the standards change pending a contract?—If the change takes place pending a contract it certainly does. It may cause loss then, and in all cases it causes disturbance.

38,458. Do they have to meet the possibility of loss by some small payment?—It is done in India and in the East through the medium of exchange banks. Of course, they have to pay something for that convenience, and where the exchange banks cannot balance, as happens sometimes, there may be a still greater inconvenience.

38,459. (*Mr. Chaplin.*) For the sake of clearness—the question was asked whether the double standard had a certain effect; was it not meant to ask whether two different standards had a certain effect?—Yes, a diverging standard.

Effect of diverging standards on prices.

38,460. (*Chairman.*) I meant by the double standard two countries each with a different standard. Do you consider this matter has any effect in causing the fall of prices in gold?—I do not think it has, nor do I think that it has any permanent effect upon exports and imports. We considered that very carefully in Lord Herschell's Committee. No doubt it has an immediate effect. Every alteration in exchange has an immediate effect in stimulating exports and hindering imports. But that is adjusted very rapidly,—much more rapidly than people suppose; and I have been unable to find (and I do not think the bimetallists have ever shown) that, taking the statistics of the trade, the trade of any country has been permanently affected by alteration in exchange arising out of currencies. There are two different sorts of exchange, and that ought always to be borne in mind. There is the alteration in exchange which arises from the balance of liquidation between two countries, even if they have the same standard. That happens between us and Australia and between us and America, for instance. The result of a fall in exchange here is that it means that we have a larger debt to pay to Australia or to America than they have to pay to us, and we have to give our goods for slightly less until the balance is restored. That is a very good thing for the exporter because he makes his profit by it, but it is not a good thing for the country; for the country it is not better to export more than you import. Then the other, which the old economists called the nominal exchange, arises from a variation in the standard. In the long run I do not believe that that which they called the nominal exchange has any more real effect upon the transactions between two countries than an alteration in the yard measure, or in the pound weight would have. It certainly does not permanently increase the producing power of the country. But where there is a depreciation of the standard, as wages do not rise as fast as prices, there is for the time being an advantage given to the capitalist and the employer at the expense of the workman. That for a time may enable him to export a little cheaper, but it is no advantage whatever to the country, on the contrary, it is a great disadvantage. It does not in the end enable the country to export more, and it at once prevents the country from importing as much, because they have not so much with which to pay for the goods which they import. On the whole, it is a great disadvantage to the country in which the standard is depreciated and not an advantage.

Right Hon. Lord Farrer.
13 Dec. 1894.

Effect of a depreciation of currency on producers.

38,461. (*Mr. Lambert.*) But when the country would be mainly or almost altogether a producing community then, I presume, it would be an advantage?—I think not at all. It might be some advantage to the exporting merchant, but it would be no advantage at all, but very much the reverse, to the producing ryot, or wage earner or labourer.

38,462. I mean the producing individual who consumes his own productions and has something left over for sale?—I do not quite understand.

38,463. If an Indian producer produces, say, 100 quarters of wheat, of which he consumes 80 quarters, then he has 20 quarters for sale, and his being paid in a currency which has not depreciated to him, would, to the extent of the amount he receives for those 20 quarters, be an advantage to him, would it not?—What is he going to do with the price of those 20 quarters?

38,464. He does not buy goods; he merely hoards the remains of his produce?—Before the exchange there were a certain quantity of imports in return for his goods; the effect of the change according to your hypothesis is to diminish that quantity of imports. He is the worse, and the whole country is the worse by the diminution of that quantity of the imports. It is a part of the old fallacy, that a country grows rich by exporting and not by importing.

38,465. This man would not import, but he would live upon his own produce?—How would he be paid for it; his produce is exported; who is to pay him?

38,466. He is paid by the currency of the country, which to him is of the same value?—Who pays him? Surely the person who ultimately pays him is the consumer in Europe who buys his wheat, and who sends him something in return.

38,467. (*Chairman.*) Does it not involve the proposition that a country would grow rich by depreciating its currency?—Yes, but that involves an absurdity.

38,468. That a country would grow rich by this process of depreciation is, I presume, an utter absurdity?—Yes, and it involves a great many absurdities. It involves the absurdity that a country grows rich by exporting and not by importing; it involves the fallacy you have supposed, and it involves the absurdity that an alteration in exchange arising out of currency can cause a real addition to currency profits.

38,469. And although it is possible the exporting merchant may make a certain profit for a time, yet he makes it at the expense of the whole country, and especially at the expense of the labour of the country?—I think so.

38,470. (*Mr. Chaplin.*) Do I understand you to deny that the individual producer—quite apart from the general interests of the country, and quite apart from the question of the country getting richer or poorer—

Right Hon. Lord Farrer.

13 Dec. 1894.

receives no advantage from the falling exchange?—I am inclined to think that the exporting merchant can make a temporary profit.

38,471. But the individual producer?—I very much doubt it indeed.

Effect of depreciation of Chilian currency on commerce.

38,472. You are not prepared to affirm it positively?—I feel no doubt about the truth of what I say, though it needs much more knowledge than I have to trace each adjustment in detail. But as an illustration of what happens in such cases I cannot trace these things altogether. But I should like to put in a letter which I found in the "Times" of December 6th this year on the subject of the trade of Chili. Their currency has been greatly depreciated, and their Government wishes to restore it and to make it an honest currency again. This letter points out at length the inconveniences which have arisen from the unconvertible currency and the difficulties which there are in recurring to a sound currency again. But one thing that the writer does—and this is why I want to put it in—is that he goes into a very careful analysis of the effect of this depreciated currency on the purchasing power of the wage-earning class, and he does it not so much for the purpose of showing how the wage-earning classes are injured by it as for the purpose of showing how it destroys their purchasing power, and in that way destroys the import trade, and in that way is a clog and an injury to the whole commerce of the country. I will put it in (*see* Appendix XVI.).

38,473. (*Chairman.*) Could you read the most important paragraphs which would bear that out?—Yes, he says:—"I will now show how the reduction of the "purchasing power, owing to the depreciation of the "paper dollar of another class of Chilians directly affects "commerce. The following may be taken as an approxi- "mate estimate of the number of the labouring popula- "tion of Chili, and the average wage earned by each "class." Then he gives the different districts, and he says the total number of labourers is 500,000, and the total wages in the year is 186 millions of dollars. He goes on:—"I have taken as a basis a working year of "300 days, thus allowing 65 holidays in the 12 months. "As a fair average per-centage of the wages earned "we may calculate 33⅓ per cent. as being spent on "imported articles. A careful calculation shows that "only 10 per cent. of the amount earned in the nitrate "districts is thus expended, the majority of these men "being single; but amongst the workers in the mineral "and agricultural sections the proportion is about "40 per cent., these latter being nearly all married "men with families. Hence I have taken a basis of "33⅓ per cent. throughout. It is worth while glancing "at what these figures imply to commerce. To-day "the labouring class in the districts I have mentioned "earn yearly 186 million dollars currency; reducing "this we get in sterling:—Purchasing power at ex- "change of 12*d.*, 9,300,000*l.*; 33⅓ per cent. expended "on imports, 3,100,000*l.* With the currency converted "at 24*d.* one must allow for a reduction of 25 per cent. "in the nominal wage rate; this gives 139,500,000 "dollars currency of gold dollars, worth 24*d.* each, as "the yearly earnings of the 500,000 labourers. This "gives in sterling:—Purchasing power at exchange of "24*d.*, 13,950,000*l.*; 33⅓ per cent. expended on imports. "4,487,500*l.* These figures show that general com- "merce has lost from this source alone the sum of "1,387,500*l.* during this year by the rate of exchange "being at 12*d.* instead of 24*d.*"—That is probably chiefly commerce with this country. Then he goes on to say:—"I could proceed to give examples of many "other classes of Chilians, such, for example, as "Government employés, where the low exchange "reduces materially the purchasing power, and hence "tends to aggravate the commercial depression." Then he goes on to say, as illustrating this:—"The falling off "in the value of imports is, however, far greater than "the shrinkage in value of the exports, and, moreover, "corresponds very nearly to the decreased purchasing "power of the wage-earning classes, due in great "measure to the fall in value of the proper dollar. "Indeed it is in such articles as cotton goods, worsteds, "and woollen tissues that the greatest decrease is "apparent. This gives an instructive lesson and "demonstrates clearly that the greatest sufferers at "the present moment are the working section of the "population;"—another instance of the way in which the depreciation of currency robs the working classes.

38,474. For this purpose, I suppose, depreciation of paper currency is not different from the depreciation of the standard?—For the purposes of this argument it is not, but in many other respects it is a very different thing.

Right Hon. Lord Farrer.

13 Dec. 1894.

38,475. For the purposes of this argument the depreciation in both cases is the same?—Yes.

38,476. So in your opinion there may be a temporary stimulant to exports, yet in the long run it would have this effect upon imports, and then later it would tell again upon the exports?—Quite so, and upon the whole trade of the country. It is a form of protection.

38,477. (*Mr. Lambert.*) But there is a temporary stimulus?—For a moment.

38,478. (*Chairman.*) But resulting in a falling off of imports, and then again later in the reduction of exports?—Yes, and in a great loss to the working classes. At this point I should like to make a further observation. In 1888 I appended to Part II. of the Report of the Gold and Silver Commission the following note:—"I wish to add for the sake not of dissent "but of distinctness that I do not believe that the "change in the relation between gold and silver "currencies has lowered English prices." I am now inclined to think that that note was expressed in language too curt and too unqualified. Though I believe, as I have stated, that the effect of a depreciated currency in stimulating exports has been much exaggerated, and cannot enable that country to compete on better terms with a country whose currency is not depreciated, or to lower prices by means of such competition, I think that there is one way in which a depreciated currency in one country may, for a time at any rate, restrict the markets and lower prices in other countries with which it deals, viz., by impoverishing the masses, and especially the wage-earning classes, in the country whose currency is depreciated, and rendering them less able to purchase the goods of their foreign customers. That this is the case in Chili at the present moment is shewn by the article from the "Times" which I have put in, and it is also notoriously the case in Argentina, both of which countries have in consequence of their depreciated and inflated paper currencies less purchasing power over English and other foreign goods than they would have had if they had maintained their currencies at par. I believe that this is also the case in Mexico in consequence of the depreciation of silver, and also, as I have pointed out in my article in the "National Review," in India. The primary and paramount injury in these cases is to the countries whose currencies are depreciated, just as protection is primarily and principally injurious to the countries which adopt it. But as in the case of protection the evil is not confined to the countries which adopt it, but extends to the countries with which they trade; so in the case of a depreciated currency the mischief of the depreciation falls chiefly and in the first place on the country in which the depreciation takes place by diminishing its purchasing power; but also and in the second place extends to the countries with which it trades by limiting the purchases it makes from them and diminishing its demand for their goods. The remedy for this evil on the part of the countries thus injured is, of course, as in the parallel case of protection, not to degrade their currencies to the level of the depreciated currency of their customer, but to maintain their own standard of value intact, and to endeavour by example or otherwise to induce their customers to maintain or return to an equally sound standard. (*See also answer to Question* 38,843.)

Effect of a rise in the standard of value on the working classes.

38,479. (*Mr. Dalton.*) Would you say that the higher you raise your standard the better it is for the working classes?—No. That is another thing. An honest straight standard is a good thing for everybody. I would not wish to rob one class at the expense of another.

38,480. Do you think if you raise the standard it would have the effect of benefiting the working men?—I imagine that it would have some effect for a time. Ultimately wages would fall, and things would be worse altogether, but for a moment, I suppose, the effect would be that prices would fall faster than wages.

38,481. (*Chairman.*) There might be a temporary benefit to the labourer, but he would be made a sufferer by a fall in wages, and ultimately he would be no better off?—That is so.

38,482. (*Mr. Long.*) When you speak of a loss to the working classes, do you mean by working classes those who receive wages paid in money?—In the case I am

Right Hon. Lord Farrer. 13 Dec. 1894.

speaking of; with reference to that particular case it is the working classes who are paid in money.

38,483. It would only apply to them?—It is a wage-paying country.

38,484. It would only apply to those men who are paid wages for the work they do, and it would not apply to the working man who works for the profit of his own industry?—You would have to follow that out in some different way, but I have no doubt it would affect him equally in other ways. Supposing one of these men instead of receiving wages to be working on his own account. At present he produces nitrates, or copper, or whatever it may be. That goes to England. He is paid for it by the English consumer of the copper or the nitrates, and with the produce he buys English goods as the writer tells you there—worsteds and various things of that sort. That would affect the man if he was working on his own account just as much as if he was earning wages.

38,485. It would apply both to those who work for themselves and for those who work for wages paid in money?—Yes.

38,486. (*Mr. Lambert.*) Supposing he did not buy English goods?—He would buy something else.

38,487. He would buy something that was manufactured or produced in his own country?—Then you come to the question whether external trade is good. Probably the external trade is carried on because it is to the advantage of both countries, and of the people in both countries. If you say that you get an advantage because it is confined to the country, it is the old question of Protection over again.

38,488. The point is that he would get no advantage if he bought products which were produced in his own country?—That article expressly says that it is an injury to the other Chili producers, as well as to the English producer, for the producing power of the working classes is injured altogether, whether for purchasing native products or for purchasing foreign products.

Principle of bimetallism.

38,489. (*Chairman.*) I now come to nearly the last head of your evidence, namely, the possibility of bimetallism. First of all, as to the principle of it, what do you say?—As far as I understand it, the principle of it is—first of all, that the mints of all countries shall be open to the coinage both of gold and of silver at some ratio or another—we will come to that presently. The free coinage in point of practice might be a very inconvenient thing, but in point of principle it seems to me to be a secondary affair; the sting of the whole thing is that people shall be able to pay their debts in either the one metal or the other at a fixed ratio. It all depends upon the ratio, to which we will come presently. But we will assume that we have settled the ratio, and that the ratio is what Professor Foxwell wants it to be, 20 to 1 instead of 33 or 34 to 1. I have great difficulty in saying what the effect would be. I think I know as little about it as Professor Foxwell did, and that is saying a good deal, except, perhaps, that I am a little more conscious of my own ignorance.

38,490. (*Mr. Everett.*) Humility is an excellent grace?—Certainly; and want of it the reverse. It seems to me that the idea is that everybody will receive the payment of their debts in this money; that they will have no interest to take it elsewhere, because there will be nowhere where the one metal will be of any greater value than elsewhere. Everywhere this ratio will prevail, and, therefore, all will go on as smoothly and quietly as possible. I do not believe in that myself at all. I believe that, supposing you had to-morrow the ratio of 20 to 1 adopted——

Maintenance of the ratio.

38,491. (*Mr. Chaplin.*) Do I understand you to say that you do not believe the ratio could be maintained?—No, I do not believe it could hold water for a moment. Supposing you get your ratio of 20 to 1, the immediate effect would be that people who had silver could pay their debts with a much smaller quantity of money or of produce than they could before—a very nice thing for the silver people, and a very disagreeable thing for the gold people. However, that would be the immediate effect. I do not believe for a moment that the business people of London and New York would stand that. I believe that they would say directly:—"We do not "know what is going to happen about this, you are "meddling with this standard in this way, we do know "something about gold, but we do not know what the "future of silver is to be, and we do not know whether "this ratio will be maintained or not, so we decline to "have anything to do with your lega tender; we can "manage perfectly well for ourselves; we will make "our contracts in gold, your ratio notwithstanding." Then you would have a tremendous confusion, because you would have the law saying, you may pay your existing debts in silver, and you would have all the people of the City and of other commercial centres making their contracts in some totally different standard. This is, of course, exceedingly speculative. Mr. Giffen thinks, and I do not say that he is wrong, that there would be a panic, and that everybody, knowing this was coming, who had a gold debt, would proceed to realise it, and that you would have all the gold withdrawn, and the whole fabric of credit undermined and destroyed. I think that is a thing that might very possibly happen, but I am not prophet enough to say that it would. I think it would depend a little upon the condition of the market upon which the new scheme fell. I think in the depressed state of the market that would most likely be the effect. On the other hand, it would do a great deal of good to the silver people; and if you proceed from the side of the silver people, or if you proceed from the side of the people who think that a great addition to the specie of the world was a desirable thing, you might have a boom, to be followed afterwards by a collapse, especially if this change were to take place at a time of sanguine speculation. You might have for a time, when there is a great demand for money, the notion prevailing that a great addition was going to be made to the reserves of the banks, and that it was therefore an opportunity for further credit, and that might assist the boom. But mind, this is all extremely speculative, and I think Mr. Giffen is more likely to see what is likely to happen than I am. I only make these speculative suggestions for the purpose of showing what a leap in the dark Mr. Foxwell is asking you to take.

Right Hon. Lord Farrer. 13 Dec. 1894.

Effect of bimetallism on the business world.

38,492. (*Mr. Giffen.*) You are aware that when a bimetallic proposal was made in the House of Commons in 1830, the official reply to it by the Ministry of Sir Robert Peel was that a panic would be caused if they were to bring forward such a Bill?—Yes, I believe it was. It would receive some support, if I remember right—you can correct me—from what happened in New York the other day only, when there was a fear that Congress might fall back on a silver basis. There was a great scarcity of gold coin for the time, and people were supposed to be hoarding it.

38,493. Has there not been a continuous feeling of panic in New York for the last two years?—Yes, something very like it.

38,494. In consequence of the apprehension that they might have to be paid in silver?—Something very like it; and it is no answer to that to say people would do what is for their own interests. People do not always do what is for their own interests. In a panic they never do. It is quite possible that people might prefer to hoard their gold and sit upon it.

38,495. (*Chairman.*) You observe, I presume, that Professor Foxwell stated that in his view contracts in gold might be permitted in future, notwithstanding this double standard?—Yes, I observed that.

38,496. And that he also went so far as to admit that contracts now made payable in gold should be observed in future?—Yes, he did; but he was going to alter contracts that had been made in the past.

Maintenance of the ratio.

38,497. Would it be possible to maintain the ratio between the two metals then, because there would be a demand for gold, totally irrespective of the double standard, for the purpose of carrying out these particular contracts, would there not?—Certainly.

38,498. In view of that you would think, I presume, that it would be impossible to maintain the ratio?—I do not believe that it would be possible to maintain it.

"Climbing" ratio.

38,499. Then with regard to what is known as a climbing ratio?—I do not understand the climbing ratio, and I do not think Professor Foxwell did.

38,500. As far as I understood Professor Foxwell it was this—that the countries who are parties to this arrangement would begin by a ratio not very different from that which now exists, namely, 33 to 1, and then after a year or two they would go to 30 to 1, then perhaps after another two or three years to 28, and so on, and eventually get back to the ratio of 20 to 1, which in his view should be the ultimate one?—I want to ask another question or two upon that before I can pretend to understand it. Are the climbing steps to be determined when the arrangement is first made; is it to be

Right Hon. Lord Farrer. 18 Dec. 1894.

a mount of two this year, two next year, and so on, if that is the case the thing will be at once discounted, and you might as well have your fall at once: but I rather gathered from Professor Foxwell that he thought the thing would be done by an arrangement between the nations—that we should have some sort of syndicate or current commission, who should from time to time fix how this ratio was to be determined. Now, conceive putting the currency of the country into the power of a commission of that kind. I cannot conceive any more crazy proposal. For instance, one of the most powerful bodies in a commission of that sort would be the United States. Look at the number and quantity of financial and economical follies which the American Government have committed within the last number of years. Could anything be more absurd than the proposal that we should put such an all important thing as our currency and our standard of value into the hands of a commission of that kind.

38,501. The proposal appears to be based on the assumption that it would be extremely difficult, if not dangerous, and possibly attended with panic, if we were to jump at once from the ratio of 33 to 1 to 20 to 1?—My answer to that is, if your climbing ratio is to be by degrees, determined beforehand, the whole thing would be discounted, and you would have your panic at once. If it was to be by degrees, to be fixed by some international commission, Heaven knows what confusion there might not be. That leads one to another objection to this whole concern. I have myself the greatest possible doubts about international arrangements about a great many of these things. I doubt very much whether our free trade treaties have advanced the cause of free trade; but there, at any rate, there was nothing which could lead to embarassment, so long as the treaty lasted. Here, however, you are actually going to put this matter of the currency, all-important as it is to the commerce of this Empire, into the hands of an international commission, to be managed in some way or other by a majority of that commission.

Determination of ratio.

38,502. (*Mr. Chaplin.*) Whose proposal was that?—This is what I understand to have been Mr. Foxwell's proposal, and I think I have seen it elsewhere. When I ask bimetallists what the ratio is to be, "Oh," they say, "that is a subsequent question, we cannot settle "that now; that must be settled by an international "commission."

38,503. I only wanted to know whose proposal it was that you were referring to?—Professor Foxwell proposed the climbing ratio.

38,504. I think I heard some statement that it was to be left to an international commission, and I want to know whose proposal that is?—It arises in this way. If you ask the bimetallist what his ratio is to be, if it is to be the existing ratio, no existing contracts will for the moment be disturbed, though I believe you will ultimately degrade your standard of value. But that does not suit the bimetallists; they do not want the ratio at 33 to 1. Then, if you make the ratio higher, you immediately alter all existing contracts, and you produce the evils of which we have spoken. Feeling these difficulties, the bimetallists always tell one, "Oh, "the principle of the thing is the only thing that we "care about now; the actual ratio must be settled by "an international commission. I cannot conceive of any government of this country being foolish enough to put such a thing into the hands of an international commission.

38,505. You have not answered my question; I want to know whose proposal it is; you speak vaguely of the bimetallists, but what has made that proposal?—I have seen it; I cannot at the moment put my hand upon any writing, but I have no doubt I can.

38,506. I do not think you ever will?—Perhaps you will answer me and tell me what is the ratio bimetallists propose?

38,507. No, I only ask you that single question?—Will you tell me that, or if they do not propose a ratio how do they propose to get at it?

38,508. You have made this statement, that there was a proposal made by what you call bimetallists that the ratio should be left to an international commission. I ask you to state for the information of this commission who made the proposal, and you are unable to answer it; that is quite sufficient?—I understood Professor Foxwell to say that this climbing ratio was to be fixed by a commission. Perhaps that will be an answer, I understood that, but he was so obscure and doubtful about the whole thing, that one has a difficulty in getting at his meaning; but, so far as I could understand him, that was the meaning.

Right Hon. Lord Farrer. 18 Dec. 1894.

38,509. (*Chairman.*) It was not quite clear from what he said whether he intended this climbing ratio to be determined in advance from time to time, or whether it was to be determined after the principle had been adopted from year to year by the different powers. I had better quote what Professor Foxwell said. It begins at Question 26,851: "(*Q.*) I understood you to "say that you yourself prefer a climbing ratio?—(*A.*) "I was speaking of the mode of transition. (*Q.*) The "mode of transition is to be a climbing ration?—(*A.*) "Yes. (*Q.*) This ratio would be begun at a low rate, I "presume?—(*A.*) Something like the market price. "(*Q.*) And gradually rise?—Yes. (*Q.*) Therefore, I "presume, it would depend on the conference or on "the majority of the conference, or on the powers from "time to time, how that climbing ratio should be "carried out?—(*A.*) Undoubtedly; they would have to "agree as to the point at which it should start. (*Q.*) "Did you in preferring the climbing ratio do so on the "ground that you consider that there would be danger "in taking the step at once from 33 to 1 to 20 to 1?—"(*A.*) I should be opposed in general to any large and "sudden monetary changes, particularly in the ratio, "which affect a large mass of trade. (*Q.*) It might "give rise to monetary disturbance?—(*A.*) It would "disturb the trade with the East very much, I think." You deduce from that that Professor Foxwell was in favour of a climbing ratio, the change to be fixed either in advance by the powers who are parties to it, or from time to time by the powers after the principle had been agreed upon?—So I understood Professor Foxwell and so I understand him now.

38,510. (*Mr. Elton.*) I understood that it was the Powers and not a commission?—He uses the word "conference." I wish to say with respect to the ratio, that to treat that as a matter of detail for a subsequent arrangement is a thorough mistake; it is of the essence of the whole question, and the way in which you can test the possibility of this arrangement is by asking bimetallists what ratio they would have.

Effect of adoption of ratio.

38,511. (*Chairman.*) Supposing it were adopted, do you consider there would be any power of compelling any power to adhere to it?—No, we do not know what might happen. I think it would probably involve a great many subsidiary arrangements with regard to the currency, which we should find it extremely inconvenient to place in the hands of foreign powers.

38,512. It would still be open to any power, I presume, to give up a standard in coin and to adopt paper currency?—Certainly.

38,513. Then you would have all the evils, or most of the evils just now complained of, but in another form?—Certainly. No doubt. If you could get rid of forced paper, and get an honest currency throughout the world, you would do an infinite deal of good.

38,514. (*Mr. Giffen.*) Any power might affect the relative demand for gold and silver, and so affect the ratio, by making regulations of its own for token money, providing, say, for gold token money, or for silver token money?—Yes, it might.

38,515. And this would have a great effect upon the possible ratio?—Yes, and the difficulty would be that although something of the same evil may exist at present, yet we should be fettered by all kinds of obligations by which we are not fettered at present.

Practicability of bimetallism.

38,516. (*Chairman.*) Have you anything further to add on this particular point of the possibility of bimetallism?—No. I do not think I have.

38,517. Looking at the arguments as a whole, do you consider that bimetallism has not been shown to be practicable, and that, even if practicable, it is not desirable?—That is my conclusion—that there has been no case made for it in the first instance, no case made for a change at all, and that if there were a case made bimetallism is impracticable and undesirable.

38,518. (*Mr. Chaplin.*) May I ask in what sense you mean that it is impracticable?—The idea of the bimetallists is that by making certain things legal tender at a certain ratio they can compel the whole world, provided the Governments agree to it, to accept those things at that ratio, and to do their business in terms of the standard at that ratio. I believe you cannot do anything of the kind. That is the short answer.

38,519. That the ratio cannot be maintained by the intervention of any Government?—Yes, I do think so.

Right Hon. Lord Farrer. 13 Dec. 1894.

38,520. *(Chairman.)* You think there is no case made out for abandoning or degrading our gold standard?—I think there is an immense case against it. I think it would be a cruel and a wicked robbery of labour.

38,521. And if it enriches anybody it would enrich a certain limited class at the expense of labour?—At the expense of the community, and especially of labour.

Arguments in favour of bi-metallism.

38,522. *(Mr. Giffen.)* You have dealt very much with the bimetallic agitation as being based mainly upon allegations respecting the fall of prices, but I do not suppose you are acquainted with bimetallic literature before this fall of prices took place in which other grounds were alleged?—No, I am not acquainted with the earlier bimetallic literature.

38,523. Is this not a case in which the arguments change from time to time, and in which there is not a consistent argument all the way through?—I am not acquainted with Monsieur Wolowski's works or with the earlier bimetallic agitation.

38,524. Monsieur Wolowski wrote before the fall of prices took place, and he was still strongly in favour of bimetallism, not merely in favour of international bimetallism, but of bimetallism at all hazards?—Yes, I think he was, but I do not know his works. I think Monsieur Cernuschi wrote independently of the fall of prices; he did not believe in the appreciation of gold.

38,525. He began before he adopted that argument?—Yes.

38,526. Mr. Ernest Seyd, I believe, argued for bimetallism before the fall of prices began, on the ground that there was more pauperism in the countries which had a gold standard than in the countries which were either bimetallic or which had a silver standard?—I did not know that that had been his argument.

38,527. I think you will find that on record in the pages of the Journal of the Statistical Society of which you are now President, if you look back a certain time?—There is a great deal there I do not know.

Fluctuations in prices since 1870.

38,528. Do you quite agree that the fall of prices is due to the pressure upon gold which began about 1870 or 1872?—No, I do not think I do agree to that.

38,529. Even if it were established, would you agree that that would still be not a sufficient argument for bimetallism?—Yes, I quite agree to that.

38,530. Would you also agree that such fluctuations in prices as have occurred since 1870, supposing them to be due to circumstances connected with the standard money are fluctuations which might happen with any standard money?—Certainly. Bimetallism at the outside can only prevent fluctuations between the value of silver and of gold if it operates as the bimetallists think it would. It cannot prevent fluctuations in prices.

38,531. And these fluctuations are quite consistent with the primary and essential objects for which standard money is established?—Certainly, most undoubtedly.

38,532. And such fluctuations have happened in former times even when gold and silver were joined by the bimetallic tie, as it is called?—Certainly.

38,533. There is no kind of money which can be invented which would prevent similar fluctuations?—None that I can imagine.

38,534. Is there not also this difficulty, that in a progressive country by the nature of the case you must have, or may have, opposite movements in the prices of commodities and in the prices of labour?—That is just what has happened.

38,535. Such as has happened in the last 20 years?—Yes.

38,536. If that is the case there is no standard which could be invented which would prevent fluctuations in the one or the other—either in commodities or in labour, you must have fluctuations whatever standard is invented?—Unless humanity becomes stationary, which I trust it never will.

38,537. That is precisely my point; that in a progressive community you cannot possibly have a standard which would be free from fluctuations; of course you would have two things, possibly and probably, going in opposite directions?—Certainly; I think it is the natural course of things.

Increase in purchasing power of gold.

38,538. With reference to the discussion as to whether the fall of prices which has taken place since 1870 or thereabouts can be described as an appreciation of gold, I suppose that you do not dispute at all that in general, there is in fact, an increase of the purchasing power of gold measured by wheat, by sugar, by copper, and by various other commodities which can be named?—That is an obvious fact.

38,539. It is an obvious fact as to which there is no dispute?—No dispute at all.

38,540. Do you also agree that most retail prices have fallen, as well as wholesale prices, in this country, although perhaps not to the same extent?—I should think that is so—not to the same extent, but they have fallen.

38,541. It is possible also, until the matter is investigated, that retail prices may have fallen in many directions quite as much as the wholesale prices?—It is quite possible. I have no information upon that except one's general knowledge, that retail prices have fallen.

38,542. Still the statement being that the working classes had benefitted by the fall of prices, they would not have benefitted unless the retail prices had fallen—the two things are involved in the expression?—Naturally retail prices would fall when wholesale prices fell, though they do not fall immediately or in the same proportion.

Purchasing power of gold as measured by labour.

38,543. Then you also agree that, measured by labour, in this country at least, gold has no greater purchasing power than it had?—Not so great a purchasing power—it has less purchasing power.

38,544. Rather less purchasing power, if anything?—Yes.

38,545. So far I think I may say that I am quite in agreement with you, and I have never written, as far as I know anything to the contrary of what you have said?—No, not on that. I think your argument was confined to commodities; I do not think you applied it to labour.

38,546. I think if you read the paper which I wrote and read to the Statistical Society in December 1888, you will find that everything which you have said about labour is stated in that paper?—It was from you that I have got a great deal of my information about labour.

38,547. Really if you describe the facts in detail as I have done it shortly now, there is no difference between us in any respect in regard to the fall in prices?—As to the facts, I think none.

Use of term "appreciation of gold."

38,548. But you contend that it is inexpedient to describe the facts as an appreciation of gold?—Yes, as a matter of words.

38,549. It is merely a question of words?—A question of words which implies a generalisation to which I am not disposed to agree.

38,550. Do you know of anything in the statements which have been used by most of the people who have discussed the subject in which the phrase "the appreciation of gold" is used in any sense but as a kind of shorthand for describing shortly the various effects which I have now put to you?—I am not sure about that, I could not say that.

38,551. Was that not very much the way in which Professor Foxwell put the thing to us; you have read his evidence?—Yes, I have read his evidence; but I thought that he assumed by using the words "appreciation of gold" a cause for the phenomena we are considering, which I do not believe to be a true one.

38,552. I think he was very careful to avoid saying anything like "cause" in using the phrase "appreciation of gold"?—I do not think "appreciation of gold" is an accurate expression, unless you say with respect to what it has appreciated.

38,553. That I quite agree with; that is just the point; when we come to detail you quite agree in the general description of the facts?—Yes, I think so.

Improvement in condition of working classes before and since 1870.

38,554. Then with reference to the question whether the change which occurred about 1870 is due to anything which has happened to money on the one side, or to commodities on the other side, would you be prepared to say that the real improvement in the condition of the working classes or of the community generally has gone on at a greater rate since 1870 than it did before that?—I am inclined to think that it has.

38,555. It is not the case that prior to 1870 there was a very considerable rise of money wages?—I have not

Right Hon. Lord Farrer.
13 Dec. 1894.

brought with me the earlier statistics as to wages. I have been looking at them since 1870, but I have not looked at them carefully before that time.

38,556. Would that not be a material point in deciding the question. I think the case as Professor Foxwel put it, following very much what I have written myself, was to this effect: that prior to 1870 the real improvement in the condition of the working classes and of the masses of the community took the form of a very considerable rise in money wages and rising prices to some extent, but still not nearly so great a rise in the prices of commodities as what you had in wages; but since 1870 the real improvement has taken the form of stationary or very slightly rising money wages and falling prices; but as far as the working classes and the masses are concerned the real improvement has been going on at a uniform rate all the time?—I should think it very likely has been; but I am not prepared without further examination of the figures to assent to any general conclusion of that kind. I am inclined to think that those American figures show that the improvement has been steady both in nominal wages and in real wages, except when interrupted by the war and the inflated currency.

38,557. As I understand, the whole question as it has been argued, and as it has been put before the world, is precisely this: that prior to 1870 the circumstances relating to money were such, that in spite of the real improvement that was going on throughout the world, and the greater facility in obtaining commodities, you had a moderate rise in the money prices of commodities and you had a great rise in wages, and what has happened since is that you have falling prices of commodities and stationary or slightly rising wages; but that the real improvement has been uniform all through, and that has been the contention of those who have used the arguments which I have used, that is, from our point of view, the whole case?—That the improvement has been steady throughout I am quite ready to admit.

38,558. (*Chairman.*) I think just now you said there had been a greater improvement since 1870 than before?—I am inclined to think that there has, but I would rather not say anything about the improvement in the condition of the working classes before 1870, because I have not come prepared on that point. But I should think it extremely likely a good many prices of the things which the working classes purchase, and which they need for their consumption rose during that period; and the extracts that I have read from Erwin Nassé show very well why that was, and why in the subsequent period they sank.

38,559. Is there any evidence that the wages of agricultural labourers rose from 1850 to 1870? (*Mr. Giffen.*) If you read a book like Sir James Caird's would you not find evidence that agricultural wages did rise before 1870; is that not a well-known fact?—I think the rise of agricultural wages took place before 1870.

38,560. Money wages?—Yes, I think they did; the price of agricultural produce especially rose during that time.

38,561. How do you explain that you had this rise in money wages generally before 1870, and that you have had comparatively no great rise in money wages since then?—I am not quite sure that you have not had a rise. I should require to look at that a great deal more carefully before I could admit the fact.

38,562. Then you have not really gone much into the question of the relative rate of material progress in this country, taking the period 1850 to 1870, and then taking the period from 1870?—I have not come here now prepared with the particular facts of which you are now speaking.

38,563. I thought some of the things which you said implied that the improvements have been much greater since 1870 than it was before?—I am inclined to think that on the whole the improvement has been greater.

38,564. I do not know whether your attention was called to a paper which I read at Manchester in 1887 on the Recent Rate of Material Progress in England?—I have no doubt I read it at the time. I have read a great many papers of yours.

38,565. You would know of it I think, because the substance of it was spoken at the Political Economy Club, but the point of that paper was this: that I thought it was necessary to explain certain things which appeared to indicate that the rate of material progress in this country had been less since 1870 than it was before—that the impression upon which you have proceeded to-day, that the rate of progress has been greater since 1870 than it was before, is not a correct one?—You are much better informed about those things than I am, but I think that the rate of progress has been very great since 1870.

Right Hon. Lord Farrer.
13 Dec. 1894.

38,566. I will just mention one or two of the figures which are before me, with reference to what you quoted from Mr. Mulhall, which seemed to me to be to the contrary effect, although I think Mr. Mulhall did not make the distinction between the two periods dividing at 1870. I find, for instance, with reference to the clearances of shipping in the foreign trade in this country, that according to a table given in the paper which I read, the increased per cent. between 1855 and 1865 was 50 per cent., and between 1865 and 1875, 60 per cent., but that between 1875 and 1885 it was only 33 per cent.?—You are now dealing with shipping?

Clearances of shipping before and since 1870.

38,567. With the clearances of shipping in the foreign trade?—Entrances and clearances?

38,568. Clearances only, but it is pretty much the same thing whether you take both or take one?—Are you taking steam shipping?

38,569. I am taking the clearances which include the steam shipping?—I will take your figures. But you must remember that Mr. Mulhall's figures apply to the whole world.

38,570. Would you look to the figures of the consumption of sugar and tea. I find in the table, which I printed in my paper, that the ratio of increase per cent. between 1855 and 1865 in the consumption of tea was 43 per cent.; between 1865 and 1875 it was 33 per cent., and between 1875 and 1885 it had fallen to a little over 13 per cent.—this is the consumption per head?—My table, which was obtained from your department, shows that in 1855 the consumption was 2·3 lbs. per head, in 1865, 3·3 lbs in 1875, 4·4 lbs., in 1885, 5·1 lbs., and in 1893, 5·4 lbs.

38,571. So that the per-centage of increase is at rather a diminishing rate?—A slightly diminishing rate, but when people are once well supplied with tea the consumption would naturally be at a diminishing rate, but it is very slightly diminishing, if diminishing at all.

Consumption of sugar before and since 1870.

38,572. Then the consumption of sugar increased at the rate of 30 per cent. between 1855 and 1865, and 58 per cent. between 1865 and 1875, and fell to 19 per cent. between 1875 and 1885?—On my table in 1855 it was in 1855, 30 lbs. per head; in 1865, 39 lbs.; in 1875, 62 lbs.; in 1885, 74 lbs. Of course you must take into account for all these things the period when duties were taken off.

Assessment to income tax before and since 1870.

38,573. Take the assessments to the income tax, between 1855 and 1865 the income tax assessments increased 28 per cent.; between 1865 and 1875, 44 per cent.; and then between 1875 and 1885 they only increased 10 per cent.?—The income tax assessment, I know, has not increased as rapidly in the later period you mention; but it increased again rapidly after 1888.

Rate of material progress before and since 1870.

38,574. I wish to call your attention to the figures mainly for the purpose of showing you that the question of the relative rate of material progress has been discussed quite independently of this controversy, and with reference to facts which were observed a good many years ago, which seemed to show that instead of our advancing at a greater rate than we had done before 1870, we had been advancing at rather a less rate. I wish now to ask if there is any kind of truth in this indication at all, is it not surprising that in the first period before 1870 you had a rise of prices, and in the next period you had a fall of prices, unless there is a change in the money of some kind?—I have given you my reason for thinking that the fall of prices was due to other causes.

38,575. Your general reason was that the improvement had been much greater in the latter period than in the first?—I did not say the improvement in the condition of the people; I said the improvements in transport and production.

38,576. I understood you to mean the improvement in the general condition of the people?—What I read from Erwin Nassé and what I believe to be true is that the improvements in transport in the later years have been very much greater, more extensive, more developed, and that the fall in freights especially—

Right Hon. Lord Farrer.

13 Dec. 1894.

both by rail and by ship—has been greater in the later period than in the earlier period.

38,577. Freights to some extent depend upon money wages, and they again depend upon the money?—If there were any truth whatever in this theory, prices ought to have been at zero before the gold discoveries of 1850.

38,578. Surely that does not at all follow; they were very much lower then than they have ever been since until quite lately?—They have just been about the same lately as they were in 1845, I think—at least according to the American returns—I can trace no relation between the supply of gold and the prices.

38,579. Can you suggest any other explanation of what has happened since 1870?—I have been trying to suggest an explanation.

38,580. I have pointing out to you different evidences that similar improvements in the cost of production—in the productive energy of mankind—have been going on uniformly over the whole period?—But that I deny.

38,581. You do not admit the bearing of the facts which I have just quoted?—No. I have been telling you all the time, that I think the improvements in transport and production, especially in articles of agricultural produce, of raw materials and minerals, have been much greater in the later period than they were in the former.

38,582. You have no statistics to give us bearing upon the point?—I have given you statistics of railways, besides it is a notorious fact that the great development—I will not say the actual mileage, though I believe that is the case—but the great development of the use of railways has been during this later period.

Development of railways before and since 1870.

38,583. Was not the great development of the use of railways in this country long before 1870?—That is a small part of the business. It is the development of the railways in Russia, India, in Argentina, and in North America, which has caused this great fall in all the produce, of which we hear so much now.

38,584. But, as compared with the previous period, these improvements in communication which took place in the 40's, and then in the 50's, and then in the 60's, were quite as great relatively to what went before as anything that has happened since?—No, they were not nearly as great. If you read Mr. Atkinson's figures with regard to the development of wheat in the United States you will see it has been in later years. I know a great many people here disbelieve Mr. Atkinson, but I believe Mr. Atkinson.

38,585. I do not think Mr. Atkinson goes at all into a careful comparison of what had happened before; I do not think he goes into the question; he does not take account of what happened to the railway system in Europe in the 40's, or in the 50's, or in the 60's?—The railway system in England is a small thing. The important thing for our present purpose, that is for raw materials and the produce of the land, is the development of railways in these new countries—in Asia, in America, and latterly in Africa.

38,586. Did not the railway system in England, when it was established, have an enormous effect in checking the cost?—There is no doubt that it had an effect.

38,587. The effect was simply enormous?—Nothing like the effect, for instance, upon wheat, or upon raw produce, or upon copper, or upon iron which subsequent developments of transport had.

38,588. I think you will find, if you look into it, that the effect relatively to anything that had happened before was much greater than even these very important changes which have happened since, but still, you had no fall of prices till 1870 came?—Agricultural prices rose immediately because there was an enormous demand for them; manufacturing prices did not rise so much.

Improvements in communication before and since 1870.

38,589. Still, it would require a great deal of investigation and careful consideration to show whether, relatively to the state of things existing before, the improvement in communication was greater since 1870 than it was between 1850 and 1870?—Undoubtedly; I have told you so. If the Commission wishes to have it, I would put in Erwin Nassés' argument, which is the fullest thing I have read upon the subject, and the best, but it is a little out of date.

38,590. But it does not seem to me to discuss the subject at all?—It seems to me that he discussed it very fully. In order to go fully into this question, you would need a book written with the elaboration of Tooke's "History of Prices."

Right Hon. Lord Farrer.

13 Dec. 1894.

38,591. Then why do you assume that the improvement has been greater since 1870, when you say it would require a book to show that it has?—What I say is, that certain features of improvement have been greater, and I have not the least doubt that they have; I have not the least doubt, for instance, about transport.

38,592. Improvements in manufacturing have been greater, you think, since 1870?—No, I did not say that, I said in transport.

38,593. These are the only things that you mentioned?—I mentioned especially transport.

38,594. Would not the improvements in the manufacturing power have as much effect in the cheapening of commodities?—I am not quite sure about that. Improvements in manufacturing power tell on finished goods. Improvements on transport tell on both ready material and on finished goods. They are, in fact, cumulative. Further, the newer the improvements, the greater they are, the more they make old improvements tell. When you have Bessemer steel on the top of railways, the addition of Bessemer steel makes the railway a great deal cheaper than it was before; so that all these things are cumulative, and tell more in the later time than they do in the earlier.

38,595. I think you will find that there is a very strong impression that the improvements in communication have been going on very steadily, not only for 50 years, but for 100 years?—It really is useless to argue about the development of the railways.

38,596. No greater improvement relatively to what went before has taken place than what you had from the improvement of the canal navigation in England, and the improvement of the roads of England, at the end of the last century and the beginning of the present century?—You had then a state of things in which you had a very limited area out of which to feed an immensely growing people. Since then you have brought the whole world under control. You have had free trade, you have had the steamships, you have had the telegraph, and you have had these huge countries all brought into competition with England, and with the English farmer, and with the English mineowner.

38,597. Still relatively to what went before the improvements which I refer to were just as great in proportion as the improvements to which you refer as having happened since 1870?—I doubt it very much; I do not think so.

38,598. Still that is a question really for serious discussion, and not one to be put aside, simply because you have observed great improvements since 1870?—No, but what I say is, you attribute this particular alteration in prices to a scarcity of gold, and I say you have not proved your case.

38,599. It is easy making statements; the question is now of the facts, and one of the essential points is undoubtedly what the rate of improvement has been, whether the other causes to which you refer would have operated at all without certain circumstances relating to money?—I take what I have stated about the improvements in traffic and transport; and when I compare them as a cause of reduction in prices, with the alleged contraction in the supply of gold; and when I look at the facts which I have stated concerning the supply of gold, it seems to me perfectly absurd to attribute the recent reductions in prices to the small demand for gold which took place soon after the 70's.

Demand for gold in 1873-79.

38,600. Were you acquainted with the feeling in the City between 1873 and 1879; were you a close spectator of the money market, and constantly following the opinions of people at that time?—No, I was not.

38,601. Was it not almost the universal opinion of the press at the time, that there was a very great pressure upon gold, and for that reason people abstained from speculative operations, and allowed prices to fall; was that not the constant experience of the people who were accustomed to large operations in the City?—I really do not know anything of the fact.

38,602. Is that not a most material factor in the whole matter, that the very people whose operations affect the prices, were influenced by the actual pressure of what they called at the time a scarcity of gold—it may not have been a good phrase?—I can admit nothing of the kind without knowing a great deal more about it

Right Hon. Lord Farrer. 13 Dec. 1894.

and whether it was a question of the scarcity of gold or not. There may have been a temporary and spasmodic scarcity of money in the market for all I know; it is no use asking me about it because I do not know. I do know that there was no chronic or permanent scarcity of gold.

38,603. Is that not most material to the whole question?—I really cannot tell you more without knowing a good deal more about the specific facts to which you refer. But there never was a real permanent scarcity of gold such as to have the effect of a chronic and permanent reduction of prices.

Right Hon. Lord Farrer. 13 Dec. 1894.

The witness withdrew.

Adjourned till to-morrow at 11.30.

Seventy-first Day.

Friday, 14th December 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq. } *Assistant*
Alan Mackinnon, Esq. } *Secretaries.*

The Right Hon. Lord Farrer re-called and further examined.

Right Hon. Lord Farrer. 14 Dec. 1894.

Right Hon. Lord Farrer. 14 Dec. 1894.

Purchasing power of gold measured by labour.

38,604. (*Mr. Giffen.*) We are agreed that in this country there is no doubt about the fact of an increase in the purchasing power of gold generally with regard to wholesale commodities and to some extent with regard to retail commodities, but that there is no increase in the purchasing power of gold with regard to labour?—No, but the reverse.

38,605. I should like to put it, is it true that there is no increase in the purchasing power of gold with regard to labour in other countries?—I do not know the condition of things in many other countries well, but from what I have read I should think the course of things had been parallel to what it has been here. In America, certainly, there has been no increase in the purchasing power of gold with respect to labour, but very much the reverse.

38,606. I have in my mind the case of India? in India, as I understand, you have had no change in the wages of the people in silver, or until the other day hardly any change.

38,607. We have been told that the purchasing power of these wages, as far as commodities in India are concerned, is pretty much what it was—that the silver commands the commodities pretty much as it did. The point I wish to put now is that as far as labour in India is concerned, seeing that gold has increased its purchasing power with reference to silver in India, it must therefore have increased its purchasing power with reference to labour?—That would be so, but I think such evidence as we had, showed that there was a considerable increase of wages in silver, at any rate in certain trades and businesses.

38,608. Only within the last few years, I think?—Chiefly within the last few years.

38,609. If I might say so, I myself was very doubtful about the construction of the evidence when I came to look at it, but, at any rate, it is only within the last year or two?—Yes; I think so, so far as one can judge. But the evidence was extremely imperfect.

38,610. You would be quite prepared to agree, therefore, that there is an increase in the purchasing power of gold with reference to labour in India?—I suppose that there is; there must be.

38,611. Then the members of the community of India would be entitled to say that in India there are all the marks of the appreciation of gold, because it has increased its purchasing power, not only with reference to commodities but with reference to labour?—Yes, if gold had been the standard in India prices and wages then would both have been lower than they are.

38,612. Still, if you had used gold in India, and the real position of labour in India remains as it is now, then you would have had a great fall of money wages in India during the last 20 years?—Yes, a fall in money wages, and prices. But Indian prices, and still more Indian wages; things are so uncertain and obscure that I am rather unwilling to commit myself to any statement of that sort without thinking it carefully over.

38,613. This is a mere arithmetical statement that I am putting to you, but you are not prepared to make any further answer?—In theory it is clear that Indian silver prices and Indian silver wages also must be higher than they would have been if gold had been the standard, or if silver had not fallen in value. The difficulty I have is in the obscurity of the facts, and in the difference between the labour systems of this country and of India.

Inflation of prices before 1870.

38,614. I think the two reasons which you gave on the authority of Professor Nassé for prices not falling before 1870 were, first of all, that there was a boom in those years?—Yes.

38,615. And, secondly, that since then there has been something with reference to transport, some cheapening of transport which never occurred before—that that is the novelty since then?—There is one other very important cause; these earlier years were years of great wars—the Crimean War, the Indian Mutiny, the American War, the Franco-German War, and the Franco-Italian war—while the subsequent years were years of peace.

Effect of wars on prices.

38,616. You do not affirm, and Professor Nassé, I think, does not affirm, that wars are a cause of high prices?—Yes, he does indeed.

38,617. But has that not been entirely refuted; was that subject not investigated by economists like Arthur Young, and was it not found that while prices are high in some wars they are not high in others—that wars do not cause high prices?—I am really unable to say; but I think that there can be no doubt that the effect of the wars I have referred to was to check production whilst increasing consumption.

Right Hon. Lord Farrer.

14 Dec. 1894.

38,618. With reference to the boom, how long do you think the boom lasted?—I really cannot tell. I do not know whether the effect of that boom, the re-action from it, has entirely disappeared yet or not.

Inflation of prices before 1870.

38,619. You would not say there has been anything like a boom during the last four years, since the Baring crisis?—I know that we suffered for an enormous while by the reaction from the boom that preceded 1872. When the effect of that ceased I could not say, but there have been rises and falls since.

38,620. When did it begin?—That is more than I can tell you.

38,621. There was no boom in the years 1867 and 1868, immediately after the panic of 1866, was there?—It was after that that the great boom began.

38,622. But the great rise in prices was long before that, was it not, in 1864 and 1865. I think Professor Jevons showed a considerable rise of prices ending in the year 1862?—I really am unable to say.

38,623. Because I dispute altogether the statement that there was anything like a boom before 1872, or ending in 1872, that there was anything greater than what happens in every time of good credit?—It is extremely difficult to say what is a boom. That boom impressed itself on my mind very much at the time it happened. There had been booms and relapses before.

Contraction of gold after 1872.

38,624. Then with reference to the contraction of gold after 1872, I think you said that as far as the rate of discount was concerned, and the changes in the rate of discount, the period after 1872 was no more troublesome, and the rates of discount were not higher than they had been at other times?—I did.

38,625. Are you acquainted with any period in the money market resembling the period from 1872 to 1879? Is it not usually the case that after a panic you have a period of languor in the money market, just as we have now since the Baring crisis? Is that not usually the case in the money market?—Yes, there is generally a period of languor after the period of excitement.

38,626. After the panic of 1866 you had a period of languor that lasted for more than two years, and which was the occasion of a very famous article in the "Edinburgh Review," on "The Strike of Capital," and that is the usual case after a panic, is it not? (*Chairman.*) Do you know anything about this article?—No, I know nothing about the article.

38,627. (*Mr. Giffen.*) Was not the peculiarity after 1872, this; that while all the tendencies of the money market were pointing to languor and depression, yet owing to the contraction of bullion and the great pressure that there was, you had frequent disturbances of the money market of quite an unusual kind in such a period of the money market?—I do not admit that at all.

Effect of contraction of gold on the money market.

38,628. Is it not the actual fact that you had disturbances in the money market in 1871, 1872, and 1873—in 1873 especially—of a most unusual kind; and then after that instead of the languor and depression continuing for several years which you ought usually to expect, you had several periods of excitement in the money market in consequence, absolutely and solely in consequence of the extraordinary demands for bullion which existed?—I do not admit that.

38,629. I put the question because at that time I was continually writing to that effect in daily and weekly newspapers, with a general agreement in the City?—I do not admit it. There may have been spasmodic and temporary demands for gold, as there often are. There was no such chronic scarcity of gold as to have a permanent effect on prices.

38,630. You do not admit it, but you are not able to name any similar period in the money market?—I have not all the periods in the money market in my mind, but what I know is that during this period during which you say the want of gold was so great, there had been an enormous accumulation of gold in the world. The reserves in the banks were ample, and there was no greater, no more feverish excitement shown by the rate of discount than there had been in the previous period.

38,631. But, as a matter of fact, the money market was disturbed and excited when, in the usual course of things, it would have been in a state of languor and depression?—I do not admit anything of the kind.

38,632. But it is absolutely certain?—That is the construction you put upon it. I will read you the broad facts with respect to the supply of gold and the rate of discount which I have got, facts I have got from authorities whom you will admit. Dr. Soetbeer has given us an estimate or account of the reserves at the banks for several years (1877–1885); you are talking about the contraction of money.

38,633. The contraction of gold?—This is the gold that was in the banks:—In 1877, 2,890 million marks; in 1878, 2,850 million marks; in 1879, 3,500 million marks; in 1880, 3,790 million marks; in 1881, 3,900 million marks; in 1882, 4,070 million marks; in 1883, 4,600 million marks; in 1884, 4,880 million marks; and in 1885, 5,040 million marks. There had, therefore, during the period in question been no reduction in the bank reserves of gold, but on the contrary, a large increase. That is the summary of what Dr. Soetbeer says.

38,634. But that does not bear upon my question, as far as I can judge; I was asking if you had not periods of excitement and disturbance in the money market when in the ordinary course of things you would have no such disturbance?—No; you asked me whether it was in consequence of the contraction of gold, and I show you that instead of the gold decreasing, the gold was increasing all the time.

38,635. As a matter of fact, these figures that you give do not specify what banks are included; whether they are always the same banks, or whether some of the banks had anything whatever to do with the state of the London money market?—I am quoting from Dr. Soetbeer, who gets out these facts for the very purpose of illustrating the point that you are speaking of. After giving details of certain banks he says (p. 201 of Appendix XVI. to Report of Gold and Silver Commission): "If we make a cautious estimate of banks "not included in the preceding table, we can present "the following summary of the probable available "holdings of gold in all the reservoirs of civilised "countries at the close of each year from 1877 to 1885;" and he then gives the figures I have mentioned; and now I will read another passage.

38,636. No; I think I must keep to my question, if you do not mind. You have adduced figures as to the amount of gold generally. I am speaking especially of the London money market, and I ask whether it is not the case that at a time when the money market would have been quiet, you had it disturbed by large withdrawals of bullion from the London money market, when in the ordinary case it would have been quiet?—They might have been withdrawn from the London money market at particular times, but there was obviously an ample supply of gold, not only in the world, but in the other banks of Europe.

38,637. The point that I am putting to you is that there was not a large supply of gold, that the supplies were obtained with great difficulty and excitement, and that the money market was disturbed when in the ordinary case it would have been languid and depressed?—I do not believe anything of the kind. There may have been momentary difficulties, as there often are; but the figures I have quoted show that there was no chronic deficiency of gold. Now I will read you another passage from Dr. Neuman Spallart, whom you admit to be a great authority on the subject.

38,638. No, I do not on this subject?—Dr. Neuman Spallart, writing in 1877, after pointing out that in the last 15 years (before 1887) the whole circulation of the civilised world, including gold and notes, had not much altered in amount, says, "The special characteristic of "this last period is that enormous quantities of the "precious metals have been collected in the treasuries "and reserves of the banks; the increase of dead and unproductive treasure from 1876 to 1885 may be reckoned "at more than 2,400 million marks (12,000,000*l.*); and "from these facts, coupled with the increased use of "commercial and banking credit, it is clear that the "supply of money ('Goldstand' he calls it) in the "markets of the world was an abundant one, and the "rates of discount sank to what would before have "been considered an impossible minimum."

38,639. If you will allow me to say so, I do not see how that bears upon the question I put as to the London money market?—If you do not see, I am afraid I cannot make you see.

38,640. My question was a question of fact, as to whether the disturbances in the money market in definite years which I mentioned were due to withdrawals of gold which were met with great difficulty?—What I say in reply to that is that during all this time there was an ample supply of gold in the world, as was proved by

Right Hon. Lord Farrer.

14 Dec. 1894.

Right Hon. Lord Farrer.
14 Dec. 1894.

the rates of discount and the returns of the banks, an ample supply for monetary purposes.

38,641. You do not admit that what happened in the London money market, when the people of the time thought it was a period of unusual disturbance, was anything remarkable?—I say it was not due to any chronic contraction of the gold available for money purposes in the world, and I say that positively and distinctly.

38,641*a*. The difficulty of supplying the gold was not a difficulty; is that what you mean to say?—I do not mean to say that there was never a temporary difficulty. I do mean to say there was plenty of gold to be had.

38,642. (*Mr. Lambert.*) For monetary purposes?—There was plenty of gold to be had for monetary purposes.

38,643. (*Mr. Giffen.*) Was it not difficult to be got?—It may have been at any particular moment.

38,644. Was there not disturbance and excitement in the money market?—That is more than I can tell you.

38,645. Was there not disturbance in 1873?—I will read to you further from what Dr. Soetbeer says. Dr. Soetbeer says that the average rate of discount in the Bank of England was for the five years ending 1885——

38,646. Excuse me, I think I must really ask you to stick to my question; I am not asking about rates of discount just now, I am asking about disturbance, which is a matter of history, and a matter of fact?—Yes, and I am going to answer you about that. It is true that in the year 1873 there was an unusual number of fluctuations—24 in the course of the year—but that is just what we should expect considering that in 1873 came the collapse after the unprecedented inflation of the previous years, the first great German demand for gold, and the payment of the French indemnity. Now, mind you, that was in the year 1873.

38,647. Do you mean to tell me that the first great German demand for gold came in 1873?—That is not what I said. I said that the fluctuations of 1873 followed the first great German demand for gold.

38,648. Did it not come in 1871? I think it was in 1872. I will not put any more questions on that?—I wish to proceed with this, if you please. I have got something more to say about that: "If, however, instead of taking "the single year 1873 we take the 13 years, 1873 to 1885 "inclusive, and if we compare them with the 13 years "preceding 1873, that is 1860 to 1873 inclusive, we find "that the average number of fluctuations in the rate of "discount of the Bank of England was 10 per cent. per "annum in the years 1860 to 1872, and only 8½ per cent. "in the years 1873 to 1885."

38,649. I must put it again that that hardly bears upon my point, which was that the money market after 1873 was disturbed and excited when in the ordinary course of things it would have been languid and depressed. That is such an unusual thing in the money market that I know of no other period in which the same thing happened; and I am asking you whether you can mention any other period?—I do not quite understand the question.

38,650. I think it is quite clear, and I do not think I need repeat it, that the money market was disturbed and excited at a period when it would usually have been languid and depressed, and that that was such an unusual thing between 1873 and 1879 that I know of no period myself in the history of the money market like it, and I ask if you can name any period?—I have not the history of the money market at my fingers' ends for the purpose of doing anything of the kind, but what I tell you is that if it was excited it was not for want of gold in the world, or for the want of gold applicable to monetary purposes.

38,651. You cannot tell us anything in detail about the year 1875 or 1877?—No, not about the detailed history of the money market; but I do know and have told you something about the aggregate supply of and demand for gold. To turn to another point. I think yesterday you doubted about the development of the carrying power in recent years.

Right Hon. Lord Farrer.
14 Dec. 1894.
Development of carrying power in recent years.

38,652. No, I think not?—I understood you to do so at any rate. I wish to add to what I said on the point yesterday. I looked at Mr. Mulhall's article in the December "Contemporary," and I gave yesterday figures on the increase in the corn trade between 1860 and 1890. I think the question was suggested whether that did not take place in the earlier time, and whether a similar development or proportionate development had not taken place in earlier years. Mr. Mulhall sums up his figures at the end in this way: he gives you the shipping tons of the world, and the railway horse-power of the world in the years 1860, 1870, 1882, and 1892. The tons of shipping in the world in 1860 were 21,730,000; in 1870, 25,100,000; in 1882, 35,060,000; and in 1892, 48,840,000.

38,653. Are those figures correct at all; those figures ought to be the figures in the Annual Progress of Merchant Shipping which you know; but there is something I do not understand about them?—I am giving them on Mr. Mulhall's authority. They are figures taken from the shipping of the whole world.

38,654. The Return I speak of deals with the shipping of the whole world, and the figures are not the same at all, as far as I can recollect?—I give them on Mr. Mulhall's authority, and I give them open to such criticism as you may make upon them. The railway horse-power, he says, was in 1860, 5 710,000; in 1870, 11,740,000; in 1882, 23,900,000; and in 1892, 34,500,000. Then he makes a sort of index number of the carrying power, which is to this effect: In 1860 it was 27,440,000; in 1870, 36,840,000, a yearly increase of 940,000; in 1882, 58,960,000, a yearly increase of 2,212,000; and in 1892, 83,340,000, a yearly increase of 2,438,000. These figures show, if there is any truth in them—and they are such simple figures that I do not think Mr. Mulhall can have gone very far wrong—that the increase in the carrying trade of the world has been quite enormous in late years, and has been much greater in late years than in earlier years. To my mind it is quite an obvious thing that the carrying trade of the world is a new feature in the trade of the world, out of all proportion to anything that has ever happened before, and that it has brought within the compass of the markets of Europe and of America all the waste places of the world—India, Australia, South America, and Western North America.

Rate of material progress since 1870.

Something was said yesterday about the rate of progress during the last 2½ decades, as compared with the previous time. The English statistics do not give us the means of showing in a single set of figures what has been the increase in nominal wages, and what has been the increase of real wages, that is of purchasing power of articles of consumption, as the American figures did which I put in yesterday. Our statistics are not to my mind, at any rate in form, comparable with the American figures. The American figures showed a great increase in both in recent years. Looking to the evidence before the Labour Commission, especially with respect to agricultural wages, and looking to the different items in our own, the statistics of wages, of prices, of consumption, of savings, of education, of diminished crime, of diminished pauperism, I am disposed to think that the rate of progress of the wellbeing of the working classes has been fully maintained in the last 20 or 30 years. I have taken out from the paper that I handed in yesterday the following table:—

Year.	Population in Millions.	Assessment. Income Tax. Millions.	No. of Scholars in Elementary Schools in Thousands.	Proportion of Paupers to Population.	No. of Paupers in Thousands.	Crime. No. of Convictions in Thousands.	Tonnage. Foreign Trade of U. K. in Millions.	Savings Banks Deposits in Millions.	Consumption of Tea per Head. Lbs.	Consumption of Sugar per Head. Lbs.
		£								
1850	27·5	256	—	57·4	1,336	41·0	14·5	28·9	1·9	25·3
1860	28·8	312	884	42·9	1,010	17·5	24·7	41·3	2·7	34·1
1870	31·3	419	1,454	46·5	1,279	18·4	36·6	53·1	3·8	47·2
1880	34·6	541	3,156	31·8	1,044	15·6	58·7	77·7	4·6	63·4
1890	37·5	632	4,231	27·3	990	12·3	74·3	111·8	5·2	73·2

Right Hon. Lord Farrer. 14 Dec. 1894.

To my mind those figures show a great and continued rate of increase, and no falling off in the rate of progress in the wellbeing of the working classes during the last two decades. But I do not wish to be led into this side issue. The rate of national progress may, on the whole, be slackening, or it may not. My point is that if it is, scarcity of gold has nothing to do with it. My reasons are these. In the first half of the century population and business progressed; but the supply and accumulation of gold was insignificant compared with what has accrued since. At the same time prices never fell so low as they have fallen now. From 1850 commenced an annual supply of gold, sometimes more and sometimes less, but more than ten times as large as that of the earlier period, leading to an accumulated stock of gold out of all proportion to increased population and business. The money demands upon this stock, whether they were 100,000,000*l.* or 200,000,000*l.*, were insignificant compared with the accumulated stock, and were spread over 15 years or more during which the new supplies still continued. These new monetary demands have long since been exhausted; the supplies of gold have accrued in ever-increasing quantities; the banks are filled with useless gold as they have never been filled before; and yet prices continue to fall. Can there be clearer proof that we must seek some other cause?

Practicability of bimetallism.

38,655. (*Mr. Chaplin.*) I am going to begin by asking you some questions on the points with which you ended in your examination in chief, namely, on the practicability of bimetallism and the maintenance of the ratio. Your general conclusion, I think, was that bimetallism was impracticable, and that the ratio could not be maintained by any intervention of Governments, that it would not hold water for a moment. Those were the words that I took down?—My great objection to bimetallism is that it is a leap in the dark. I do not think that the ratio could be maintained.

Definition of bimetallism.

38,656. You gave a definition of bimetallism as you understood it; one condition of bimetallism was, you said, that the mints of all the countries should be open to the free coinage of silver?—Of both gold and silver.

38,657. Where do you find that?—I always imagined that that was the foundation of the bimetallist theory, or the mints of all important countries, at any rate.

38,658. But that is a very distinct qualification. May I remind you of a paragraph in the second part of the Report of the Gold and Silver Commission which I think lays down the condition more accurately, and ask you if you still agree with it. I quote from section 105: "We shall for the present pursue the inquiry "upon the assumption that an international agree-"ment could be arrived at under which the United "Kingdom, Germany, the United States, and the "Latin Union, should be parties to the adoption of a "bimetallic system with a ratio approximating to the "market ratio." That is, I think, what you would adhere to now?—Yes, I will accept that as the view of bimetallists.

38,659. I know you paid great attention to the subject on the Commission?—I will accept that as the view of the bimetallists.

Maintenance of ratio.

38,660. When you say that the ratio could not be maintained, may I remind you of another paragraph in Part 2 of the Report—the third paragraph of section 107, on page 85: "We think that in any conditions fairly to "be contemplated in the future, so far as we can fore-"cast them from the experience of the past, a stable "ratio might be maintained if the nations we have "alluded to were to accept and strictly adhere to "bimetallism at the suggested ratio. We think that "if in all these suggested countries gold and silver "could be freely coined, and thus become exchangeable "against commodities at the fixed ratio, the market "value of silver as measured by gold would conform to "that ratio and not vary to any material extent." How do you reconcile that paragraph and the statement which you made just now and yesterday, that the ratio could not be maintained by any intervention of Governments?—I admit my responsibility for that paragraph.

38,661. At any rate you signed it?—I have signed it, and I am fully responsible for it; but if it lay with me to pen that paragraph with my present knowledge, and seeing the use that is made of it, I should pen it in a more cautious form. But I wish you to observe what the condition is: "If the nations we have alluded to "were to accept and strictly adhere to bimetallism at "the suggested ratio"—that is the condition. Will they do so; that is, not only will the Governments do so, but will the nations do so? Then it goes on to say, "We think that if in all these countries gold and "silver could be freely coined and thus become "exchangeable against commodities at the fixed ratio." If that were done, there is no question that they would be. Then, allow me to say—I will not trouble the Commission by reading it—that the whole of the next two pages, or almost the whole of them, contain the conditions and qualifications under which that passage is to be accepted; and those conditions would very much modify it.

Right Hon. Lord Farrer. 14 Dec. 1894.

Practicability of bimetallism.

38,662. I am not prepared to admit that; but still I will ask you this question: Do I understand now that your doubt was more than a doubt—that your statement as to the impracticability of bimetallism is founded upon this: that you think the nations would not adhere to it?—I think you cannot be sure that the individuals composing the nations would adhere to it.

38,663. Is that your reason why you think it impracticable?—That is one reason why I think it impracticable.

38,664. Then you adhere, I understand, to your originally expressed opinion, that if the nations would adhere to it, then it is practicable?—Certainly. After all, value is only a matter of opinion, and if the whole of the nations, and of the people composing those nations, agreed to take gold and silver at a certain value, it would be so taken. The question is whether you can get the people so to agree.

38,665. That is your difficulty; the thing is possible provided the nations agree to it and adhere to it?—Yes, meaning by "nations" not only the Governments but the communities, and the persons who constitute those communities.

38,666. Those communities mentioned in the paragraph to which I have referred?—Yes; including all the persons composing those communities, *e.g.*, the New York bankers and the English bankers as well as the Governments.

38,667. The communities that you refer to as "the "United Kingdom, Germany, the United States, and "the Latin Union"?—Yes, I will accept that.

38,668. If those communities would agree to it and would adhere to it, you think the thing is perfectly practicable?—I think if all those nations agreed, and all the people in those nations agreed and always continued to agree to take anything at any value whatever that thing would be taken at that value.

38,669. You mentioned, I think, as one of the objections to any such proposal, that if people were permitted by the law to pay either in gold or in silver, this still would happen, in your opinion, that people would make contracts in which they would insist upon being paid in gold?—I think so.

38,670. Why was that not the case before, when the bimetallic law was in existence, both in France and in the United States, for instance; people never made express contracts to be paid in gold at that time, did they?—But the moment there became a fear of a variation in the ratio they did make contracts that the payment should be made in gold. For a long time all contracts for fixed payments made by financiers in New York have been made to be paid in gold.

38,671. You say the moment there was a fear of there being any variation; when did that fear arise; did it arise until after the mints had been closed; could you give me any instance of its arising before?—I am not sufficiently acquainted with it to say what was the case before, or when exactly the practice arose.

38,672. After the mints had been closed, and after the bimetallic system had ceased to exist, then you say that contracts began to be made in gold; and that I should not dispute for a moment?—Quite so; we are agreed there.

Effect of adoption of bimetallism.

38,673. Then you held out before us that if such a law was adopted it might result in a panic; is that a matter upon which you entertain very grave and serious apprehension?—I said that anything I could say upon that subject was of the most speculative kind; that my real objection to the whole thing is that it is a leap in the dark. I do not know what will happen. I said, I think, that there were circumstances under which it might possibly cause a boom; there were other circumstances under which it might possibly, and more probably, cause a panic; and I think you see, from what has

Right Hon. Lord Farrer.
14 Dec. 1894.

happened in New York lately, that that is quite possible.

38,674. Do you consider that what has happened in New York lately can for a moment be held to be analogous to what you are foreshadowing might possibly happen under bimetallism, when in New York there has been nothing like bimetallism or anything approaching to it?—No, but I think bimetallism would be an even more shaky thing than the bankers of New York have recently contemplated in the United States.

38,675. You think that?—Yes, I do indeed.

38,676. I am afraid we should differ altogether upon that point. You are aware, I suppose, that it was foretold by many bimetallists at the time, and that they always held the opinion, that the legislation contemplated in New York, such as the Sherman Act, was certain to be a failure?—I do not charge the bimetallists with any advocacy of the Sherman Act.

Practicability of bimetallism.

38,677. Upon this point of the panic, as you seem to think it is a really possible danger, I want to ask you one or two more questions. I suppose you will admit that if a sufficient number of foreign nations came to an agreement for the purpose, they could perfectly well re-establish the bimetallic system without the assistance of England, just as they did before?—Providing they possessed both gold and silver and were willing to take the silver. I am not at all sure, though. It is one thing to have kept the system going when it was alive; it is quite another thing to restore it.

38,678. You go so far as to say this, then, that the ratio could not be maintained if other nations made the agreement and England refused to join?—I do not go so far as that, but I do not say that they could make it so as to maintain it.

38,679. You cannot pronounce an opinion one way or the other on that?—No.

38,680. You cannot say to me that I am wrong in the conviction which I hold, that foreign nations could establish bimetallism to-morrow if they pleased to do so, without England joining?—My impression is that they could not, but I should be sorry to speak positively upon that point.

38,681. Upon the assumption that they could, if that system was re-established you will admit, I suppose, that the effects of it as regards prices and everything else would be universal?—I suppose, too, that the effect of it would depend very much upon what the ratio was.

38,682. It would be just the same whether England joined it or not?—It would depend on what the ratio was.

38,683. Yes, but the effect of it would be the same whether England joined it or not?—That I can hardly say.

38,684. You are not prepared to say it would not?—I am not prepared to say that.

38,685. Because it would follow, would it not, that if you were prepared to agree that foreign nations if they chose to do it could re-establish bimetallism by themselves—which I have never heard disputed before—then, if bimetallism is probably the cause of the panic, we are really in this country standing on the edge of a precipice, over which we may be pushed by foreign nations at any moment, and over which we should have no control; would that not be so?—I do not think that I am prepared to admit—things being in the state in which they are—that any nation or set of nations could restore the condition of things which existed at a time when many of the nations were willing, and the people who belonged to those nations were willing, to take silver. The thing existed because it had not been settled whether silver or gold should be taken, and certain nations were ready to take silver. Whether you could restore that state of things or not is, to say the least, most doubtful. I do not think you could.

38,686. I am asking you these questions on the assumption that bimetallism was re-established. Bimetallism being re-established surely would mean this, that the nations had shown themselves to be willing to take silver?—It would never be re-established unless they were. My impression is that if other nations were to arrange between one another to make what appears to me to be so shaky an arrangement, we had better stand out of it and keep to our own standard.

38,687. That is another question altogether, and I can quite understand your holding that opinion; but upon the point which I put to you that foreign nations could re-establish bimetallism, if they chose to do it, without the consent or concurrence of this country, as I understand, you are not prepared to say that I am wrong in that view?—No, but I am not at all prepared to say that they could.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,688. It is a subject you have not considered?—My inclination and my opinion is that they could not, and, which is much more, that they would not.

Maintenance of the ratio.

38,689. Am I to understand, as the result generally of what you have said to me in reply this afternoon, that to a certain extent you have changed the opinions which were indicated in those paragraphs to which your signature was attached when you were a member of that Commission?—No, I do not think that I have. I feel more strongly now than I did then what a leap in the dark it is. I am not sure that I see any farther into the darkness, and I am quite certain that the glimpses I get into the darkness do not make me more in favour of taking that leap in the dark.

38,690. But in spite of its being a leap in the dark, you attached your signature in those days to a very explicit statement that the ratio under certain conditions could be maintained?—Yes, if everybody agreed to maintain it.

38,691. Yesterday you told us without qualification that it could not be maintained?—I do not think it would be maintained; I do not think people would agree to it.

Production and consumption of gold and silver.

38,692. There I think we had better leave this part of the question, because I am unable to reconcile the two statements. It is your contention, I think, that the production and consumption of silver are perfectly distinct. I take this from section 3 of your brief. You say that the bimetallists "propose a double standard, in other "words to fix by law the relative value of two objects, "viz., gold and silver, which nature has made separate, "and the production and consumption of which are "perfectly distinct." That is your opinion?—Yes.

38,693. Is it not the case that in many mines, or certainly in some mines, they produce both the metals, and that the gold and the silver are produced together?—Yes, that is the case; but that is not what I meant by this paragraph. The general and large production of gold is totally independent from the general and large production of silver. Occasionally they are produced together, and I suppose when they are produced together they are produced in different proportions.

38,694. Have you ever heard of the Comstock Mine?—I know the name.

38,695. There is a large production of gold and silver there?—Yes, I do not deny that gold and silver are in some cases produced together.

38,696. In the report of the United States Monetary Commission of 1876 I find it is stated that some 300 million dollars worth of bullion were produced by the Comstock Mines in a few years, ending within the date of that Report?—I should think very likely.

38,697. And that about half of this value was derived from gold and the other half from silver?—Very likely.

38,698. Is not that rather contradictory of your statement that the production of these two things is entirely distinct?—The words are used in a different sense. When I said the production and consumption are entirely distinct, I meant that there is no fixed relation whatever between the production of gold and the production of silver, or between the consumption of gold and the consumption of silver.

38,699. So that it would not be quite accurate to say, as stated in your brief, that the production of these things is entirely distinct?—For my purpose it is, quite.

Statistics of production of gold and silver.

38,700. You gave us some very interesting statistics about the production of gold and silver, and you referred us to the Director of the United States Mint as a great authority upon this subject, I think?—I did.

38,701. Is there not a good deal of guess-work about these estimates, even from the Director of the United States Mint?—I think they are as good statistics as you can get. I suppose that all the figures, when you get back to a certain period, are very doubtful, but I should think that the figures of production of late years are tolerably trustworthy.

38,702. You are aware that it has often been stated in public that there is an enormous capacity for an almost

Right Hon. Lord Farrer.
4 Dec. 1894.

unlimited production of silver in the United States; have you not heard that statement made?—I have seen it stated; I have seen every kind of statement about it.

38,703. Are you aware of any proof whatever of that statement?—I never stated it myself.

38,704. You do not hold that?—I know nothing about it. I observe that it is produced in enormous quantities, and that it is so produced in enormous quantities, notwithstanding the alleged—I do not say the true, but the alleged—falling off in the monetary demand.

38,705. You have referred to a gentleman to whose opinion, I think, you rather deferred on a good many matters, who has given evidence here, Mr. Atkinson?—Yes.

38,706. Have you read his evidence upon the subject?—No.

38,707. Mr. Atkinson stated to us that the possible production of gold, in his opinion, was very much exaggerated; but you will be able to say nothing about that?—No, I cannot say anything about that.

38,708. Are there any laws of the United States, or of the States respectively, which require the mine owners to make returns of the quantity of bullion produced?—I cannot tell you.

38,709. Is there any tax on mining for the precious metals?—I cannot tell you.

38,710. You do not know whether there is any obligation to make such returns?—No, I do not.

38,711. So that really, as to the foundation of these statistics, we are a good deal in the dark?—All that one can say about those statistics is that they are the statistics of men who have given their attention and time to get such facts as can be got at. I am no statistician myself, and I do not pretend to be a critic, but figures given by such men as Soetbeer and the Director of the American Mint are generally received by economists and writers and statesmen as having, at any rate, some general truth. Anyone who has had as much to do with statistics of any kind as I have knows how slippery and uncertain a great number of our statistics are; but there is a certain general average truth about them, and probably the errors of one year are averaged throughout the whole, so that you may take it, for the purposes of comparison, as tolerably correct. I cannot say so of the statistics of consumption; about that I have not said a word.

38,712. I observe that the Director of the Mint states in his last report, namely, for the fiscal year ending June 30th, 1894, that there were several hundred million dollars of gold in circulation or in the hands of the people in the United States; are we to take that as reliable, do you suppose?—I really cannot tell you.

38,713. Do you know at all whether gold coins are in common use throughout the States at the present day?—Certainly not. In California they are, but I believe not in the Eastern States.

Gold as standard of value.

38,714. Now I want to ask you just a few questions with reference to what you said with regard to the standard. Gold, you said, was our standard of value?—Yes.

38,715. And it is that which is the measure of value?—That is so.

38,716. What gold do you include in this; I think I understood you to say all the gold that was estimated to be in existence in the world?—Our standard is the English sovereign, which is a certain weight of gold of a certain fineness and quality. That is our standard.

38,717. Gold performs the function of being the measure of value?—Our measure of value is that gold sovereign.

38,718. I understood you to say that in that estimate of the value of gold all the gold in the world must be taken into account?—I think so.

38,719. That even hoards must not be excluded from it?—I think not.

38,720. I wanted to arrive clearly at what you meant by that: that the value is to be estimated by being measured by the whole of this great mass of gold?—The value depends upon the relation of the aggregate supply to the aggregate demand. In taking into consideration the aggregate supply you must take into consideration all the gold which is not actually destroyed, and which under any circumstances might be brought into the market. Of course the difficulty of getting it into the market forms one factor. It may be more difficult to get from one place than it may be from another, and that has all to be taken into consideration. But what I meant was that you were not, because hoards are in India, to say that they have no effect upon the value of gold in London; and because I have gold in my watch that that is not to be taken into account in considering the value of the gold in the standard sovereign.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,721. That is exactly what I wanted to arrive at. All this gold, whether it is in hoards or not, you contend affects the value of the whole mass?—Certainly, more or less.

38,722. And as such plays a part in measuring the value of everything else?—I think so.

38,723. If silver was the standard, or where it is the standard, would the same thing or does the same thing hold good?—Yes, I think so.

Production of silver.

38,724. You told us you had put in the amount of silver in existence in the world?—I put in from the same statement of the Director of the United States Mint a statement of the production of silver since the discovery of America carried down to the year 1893.

Stability of standard of value.

38,725. Now, going further, you admit, I think, that the essence of a good standard is to be as stable as possible, and not in itself to be subject to variations?—Yes, you want it to be as stable as you can get it.

38,726. How is stability exhibited—by there being little or no change in prices?—It is an extremely difficult question to put into words, but I think stability would be measured, if you could measure it, by taking all the things against which gold is exchanged or said to be exchanged and averaging the whole.

38,727. And if upon that average you found that there was a little or very little change in prices that would indicate stability in the standard according to the change?—Yes; supposing you take everything—but I warn you we are in the depths of speculation here ——

Purchasing power of the rupee.

38,728. Silver, it appears to me, has performed this very function which you describe in India, and, as exhibited by all the things which are measured in price there, it has changed very little indeed; and yet you say silver is a bad standard?—I say, if silver prices of articles of wholesale consumption, which have been produced with a much smaller amount of human effort than they formerly were, have remained the same, it is to my mind a proof that silver is a bad standard.

38,729. That is what you said, I am aware; but I do not follow it because you and I, if I may remind you, both put our names to a paragragh to this effect on the Gold and Silver Commission, when the rupee was the standard of India; we then expressed the opinion that the purchasing power of the rupee had not altered, that is to say that stability in the standard had been exhibited in the way I have indicated to you by hardly any change in prices?—Yes; if you call steadiness of prices stability of the standard.

38,730. The purchasing power of the rupee had not altered?—Yes.

38,731. It had, therefore, exhibited stability on your own test?—Yes; if you mean steadiness of prices.

38,732. I ask you the question because it appears to me that you accuse silver of being a bad standard, although it has fulfilled the very test by which you say that you judge of a good standard?—But it has not fulfilled that duty in Europe, whatever it may have done in India, and I do not think it has done so in India. It has certainly not done so if silver prices remain the same, whilst the cost of production has decreased.

38,733. Because it is not the standard in Europe, and it is the standard, you tell us, which measures value, and it is the standard in India, or was until you were instrumental in closing the mints?—It is or was the standard in India; and I repeat that if the cost of production and of transport have largely diminished, and if notwithstanding silver prices have remained the same, it is a proof that silver is *pro tanto* not a good standard. But I must add, as I did in answering Mr. Giffen, that the facts concerning Indian prices and wages are very uncertain and obscure.

"Money of the market" and prices.

38,734. Now I want to go a little bit further, and clear up something else on which you gave information. Having told us that gold was the standard, and that it was the measure of value, then you go on, in paragraphs 32 to 37 of your brief, to say it is what you call the money of the market, which has to do with

Right Hon. Lord Farrer.
14 Dec. 1894.

prices; is "the money of the market" your own expression, are you the author of it, or is it taken from someone else?—I took it from the newspapers and from general languages.

38,735. This money of the market you tell us is capable of almost indefinite expansion and contraction, from which I gather it is like an india-rubber standard—you can pull it about, you can stretch it or contract it as much as you like?—Considered as a medium of exchange; not as a standard of value.

38,736. You said, as having to do with prices?—Yes, as having to do with prices.

38,737. Having previously told us that it was the standard which was the measure of value, and which therefore governs prices?—I never said that the money of the market was the standard of value. I said it was the medium of exchange, but you have to separate in your mind distinctly between the standard of value and a medium of exchange. The gold sovereign is the standard of value, and the only standard of value in this country, but it is not the only medium of exchange; in fact, it forms a very small part of the medium of exchange.

38,738. We will keep first, if you please, to the question of the measure of value; on your showing on what you have told us up to now you have a gold standard which is the measure of value, and at the same time you say that you have the money of the market, which also measures prices?—No, not which measures prices——

38,739. What does it do then?—It makes prices, or prices make it. I am not sure which.

38,740. "Which makes price"?—What we really use as a medium of exchange is the money of the market. Take bankers' cheques; each pound in those cheques is convertible into the sovereign, and is of exactly the same value as if it were a gold sovereign. It is the whole quantity of that money which makes prices, or which is made by prices; I am not sure which.

38,741. When you say makes prices do you mean that it measures prices?—No, it does not measure them, it makes them.

38,742. But how can it make them without measuring them too?—Supposing credit is very high, and that people are very sanguine, and have great belief in the future, that there is a great deal of credit money going, then that money makes high prices because there is a great deal of it.

38,743. When you say that it makes prices, you mean that the prices depend upon that money, whether there is more of it or whether there is less?—Yes, or it depends upon the prices; the terms are correlative.

38,744. We will take it first that the prices depend upon whether there is more or less of that money?—Yes.

38,745. If that is so it clearly measures the prices; the amount of it measures the prices?—The amount of it used as a medium of exchange makes prices.

38,746. You put it in both ways, and I said we will take the other first; you said the prices were made by this money according as to whether there was more of it or less. I therefore say on your own showing, and I put it to you, that it measures the prices, on that side of the question?—You may use the phrase if you like, but the thing that really measures the prices is the standard.

38,747. Then we have got two things, we have got the standard which measures the prices and we have got the money of the market which measures the prices? I do not understand you. I have never said that the money of the market measures prices. It makes prices; and every pound of the credit money is exactly equivalent for the purpose of a purchase to the gold sovereign.

38,748. Quite so; but what I want to arrive at is this: you have landed us apparently in this position, that we have got two things which measure the prices; one is the gold standard, and the other is what I have described as an india-rubber standard, which is susceptible of any amount of expansion or contraction. How is it possible that both those things can be the measure of value?—I never said that credit was the measure of value.

38,749. You certainly admitted to me in argument just now, taking one side of the question, that it measured prices?—I said that it was a thing we used as a medium of exchange, not that it was the measure of value.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,750. You also admitted to me in argument that it measured prices, that it made prices?—That it makes prices.

38,751. And therefore measured them?—That is, I think, a very incorrect phrase. I do not think there is the slightest inconsistency in what I have said.

Fall in prices and agricultural depression.

38,752. We will pass from that question, and I wish now to ask you a few questions upon the appreciation of gold, which I understand you do not admit; of course you know that we are suffering from agricultural depression?—Oh dear, yes.

38,753. Every witness that we have had before us here agrees that the main cause of that is the fall in prices—of that you are aware?—Yes.

38,754. Then I understand you to say that we have not proved our case, our case being this, that the fall in prices is due to a change, partly at all events, in the value of money itself?—In the standard?

38,755. Yes?—No, I do not think you have proved your case there.

38,756. Your case, I understand, is this, that the whole change has occurred in relation to commodities?—I think so.

38,757. When did that change in prices as far as agriculture is concerned begin—it began, I think, about 1876, or from 1876 to 1879?—Yes, that agricultural prices varied. If I remember right the cereals and things which were comparatively easy of transport began to fall first, and I remember at that time Sir James Caird saying to the people of the West of England, who relied upon beasts, "You must not depend "upon the high price of meat, because that will not "continue, for that will be affected by the increase of "carrying power." I only mentioned that to say that I think the fall of cereals occurred before meat fell.

Improvements in production and transport before and after 1870.

38,758. You have stated that in your opinion the greatly increased facilities for production and transport had their largest effect after 1870?—I think so.

38,759. They began to take their greatest effect after 1870?—I think so.

38,760. Why did not the prices begin to fall before 1876 or 1879 if it was due to nothing but commodities?—It takes some time before all the new processes of carriage are developed. A railway is made, and then it takes some time before the use of it is developed; the Suez Canal is made, and the traffic is small at first; the Manchester Ship Canal is made, and the traffic is now very small. It is a matter of gradual growth.

38,761. You admit that these increased facilities had been in operation for many years before 1870, which of course cannot be denied; that it was by 1870 that they had got into full operation; and that from that time forward we have been having their most full effect; then we had a period several years after that during which prices did not begin to fall. How do you account for that if it is only commodities?—I do not say that they got into full operation; I said that they were coming into operation, and have been coming into fuller and fuller operation ever since.

38,762. Apart from that, taking it upon that ground, is it not a very common opinion that it was immediately after the inventions of science, such as steam and electricity, the telegraph, and all those things, and railways, that the most marked advances in facilities for production were made?—What time do you mean?

38,763. When they were first made?—Of course all improvements have some effect at once, but it is a long while before they take full effect, and the facilities for transport have been, I think, much greater in later years.

38,764. I really forget myself the exact date when they began, but it was long before 1870?—Of course we have been going on improving from the beginning of the century and long before that.

Effect on prices of gold discoveries in Australia.

38,765. I asked you the question yesterday whether it might not be possible that it was the effect of the great gold discoveries in Australia which had checked the fall in prices, which would otherwise have occurred from the development of these inventions of science?—I think it may have had some effect.

38,766. I thought you said yesterday you believed it had not?—What I said was that I have always thought

Right Hon. Lord Farrer. 14 Dec. 1894.

that the actual production of gold was of less importance than the development of the country.

38,767. At all events, you think that there are ample reasons to account for the fall in prices, apart from any changes in the value of money?—Yes, I do.

Supply, and prices of wheat compared.

38,768. I am going to ask you about one article, the article of wheat, with regard to which I find a very interesting statement indeed published in the "Corn Trade Review" quite recently—one of the last issues. Are you acquainted with the "Corn Trade Review"?—No.

38,769. Then you are not able to say how far it is reliable?—No, I do not know anything about it.

38,770. The "Corn Trade Review" points out that, according to their figures in 1891, the world's wheat crop was 307,000,000 quarters, and in that year the average price was 37*s.* per quarter; in 1892 the crop was 305,000,000 quarters, and the average price was 30*s.* 3*d.*; in 1893 the crop was 307,000,000 quarters, the same as in 1891, but the price had fallen to 26*s.* 4*d.* Now the result of those figures is this, that in 1892, with a smaller crop, compared with 1891, we have a fall in price of 18 per cent., and in 1893, with the same production as 1891, we have a fall in price of 29 per cent. as compared with 1891. Can you account for that state of things at all on the supposition that it is entirely due to commodities?—No, I do not understand it at all. I have not paid any attention to it. All I can say is that it certainly is not due to the scarcity of gold, because the supply of gold has been much increasing precisely during that period.

Fall in prices of silver and wheat.

38,771. Are you aware of the contention that is maintained by a good many people who have studied the bimetallic question, that whether it is a question of cause or effect or not, the coincidence between the fall of silver and the fall of wheat has been very remarkable—have you heard that?—I do not remember it with respect to wheat especially; but with regard to commodities generally there were Sir David Barbour's parallels line that we saw so much of on our Commission.

38,772. There are lines of the same sort now made with regard to wheat and silver. I ask you these questions because it is a very extraordinary coincidence, I think you will agree, if it is nothing more than a coincidence, that this extraordinary fall in the price of wheat, although there has been a smaller production for which it seems very difficult to account, is concurrent with the great fall in the price of silver, which followed immediately upon the closing of the mints?—That is very curious, especially if I remember aright, but I am not sure, that the supply from India which is a silver country, has lately fallen off.

38,773. I cannot tell you what the figures are now?—I think that is so.

38,774. In 1893 I do not think it had fallen off then, and 1893 is the year I am speaking of?—At any rate India has played a smaller part in the supply of wheat to the world.

Appreciation of gold.

38,775. When you tell us that you do not believe in what is commonly called the appreciation of gold, you are aware of course that you are confronted by a long list of great authorities and eminent men upon this subject?—Yes, and I believe also supported by equally great authorities on the other side, whom it is scarcely worth while to mention.

38,776. It is my business perhaps from the point of view which I look at it to take the opponents. Are you aware that as long ago as 1879 Lord Beaconsfield, in a speech on agricultural depression, pointed to the appreciation of gold as one of the causes?—I have seen that, but I am not quite certain that I should accept Lord Beaconsfield as a first-rate authority on such a point.

38,777. May I first read his words:—"Gold is every "day appreciating in value, and as it appreciates in "value the lower become the prices, that I believe to "be the third cause of agricultural depression"?—I suppose Lord Beaconsfield had had some good prompter.

38,778. Then Mr. Goschen, you are aware, perhaps, has offered opinions very much of a similar character?—Yes, I am quite aware of that.

38,779. Do you recollect his making this statement in the House of Commons in 1883, on February the 19th: "His point was this: that as the result of inquiries "now being made, it appeared that there was what "could scarcely be denied a considerable appreciation "in the value of gold, and that appreciation in the "value of gold had had a general effect on the prices "of almost all commodities, unless there were very "special counteracting circumstances." In forming your opinions on this subject, had you come across those opinions before?—Yes.

Right Hon. Lord Farrer. 14 Dec. 1894.

38,780. And examined them?—That was one of the first things I ever read on the subject.

38,781. Were you a member of the Commission which sat on the depression of trade, of which Sir Stafford Northcote was the chairman?—No, I was not.

38,782. Did you ever read and study their report?—I know there is a passage about the appreciation of gold there—I am quite aware of it. Remember, these things were all said long before we knew what is now known.

38,783. Yes, I am aware of that—in the past century. Is this the passage you refer to: "We expressed in our "third report the opinion that this fall in prices, so far "as it has been caused by an appreciation of the "standard of value, was a matter deserving of the "most serious independent inquiry, and we do not, "therefore, think it necessary to investigate at length "the causes which have brought it about, but we desire "to give it a leading place in the enumeration of the "influences which have tended to produce the present "depression"?—Yes; I think that passage had a great deal to do with the appointment of the Commission on which you and I sat.

38,784. I believe it had, too. However, I am marshalling as against your great authority the names of three ex-Chancellors of the Exchequer, Mr. Goschen, Mr. Disraeli, and Sir Stafford Northcote; I do not propose to say anything about another great authority, Mr. Giffen, after the passage of arms you have already had. Then you made use of this expression, I think, with regard to appreciation; that it is nonsense to talk about the appreciation of gold when some things measured in gold have increased in value?—If I used the word nonsense, that was a strong word. But I think appreciation of gold is an incorrect expression.

Agricultural wages.

38,785. You cited the circumstances with regard to labour which are referred to in recent reports of the Labour Commission to support your contention?—Quite so.

38,786. You rely upon them to a great extent, I suppose?—Very considerably. I say the gold price of labour has risen.

38,787. Now, that report, I think I am right in saying, was founded upon the reports of sub-Commissioners which were published in 1892 and 1893?—I quoted Mr. Little's report, which was published in 1894.

38,788. It is possible, I suppose, that there may have been some change in that respect which has begun ever since then?—It is quite possible that wages may have fallen since then, but we have been talking about prices and wages at a much earlier date—since 1870. Mr. Little himself points out, that if the present state of things continues the probability is that agricultural wages will fall.

38,789. Are you aware of the evidence we have had already with regard to agricultural wages; one witness said that they had fallen from 18*s.* at their highest point, to 12*s.*, which was their present point?—I have not read any of that evidence before your Commission.

38,790. You are not aware that a good many witnesses have told us that there are a great many agricultural labourers out of employment altogether?—I should think it is quite possible.

38,791. If you were aware of these things, would that tend to modify the expression you have used here?—Not with respect to gold, because this has happened just at the time when gold is more plentiful than ever has been known in the world before.

38,792. When you say more plentiful, do you mean more plentiful actually, or more plentiful in respect to the demands upon it?—More plentiful in respect to the demands upon it.

Demand for gold.

38,793. Then you do not think the demands have increased upon gold very greatly during the last few years?—When I see gold lying idle in the banks, and the great bi-metallic newspaper in London grumbling because they cannot get rid of it, and scolding Austria because they do not take away more of it——

Right Hon. Lord Farrer.
4 Dec. 1894.

38,794. (*Mr. Giffen.*) What newspaper is that?—A recent number of the "Financial News"; I have got it here. It gives the enormous surplus that there is in the banks this year over last year, and then, in a subsequent article, is extremely angry with Austria for not taking away more of it.

38,795. (*Mr. Chaplin.*) From that point you have already admitted that prices have fallen largely, and, apparently, are still falling—that the tendency is to fall?—Yes.

38,796. May not this be an explanation of the great apparent plethora of gold in the banks, that when you are confounded with a period of perpetually falling prices, people do not like to invest their capital in industrial undertakings?—Yes; but then if scarcity of gold was the cause, the plethora of gold in the banks ought to start prices upwards.

38,797. But why?—That is for you to tell me. I asked throughout our Commission every witness to give me the nexus between gold and prices, and I always failed to get it. It is you that say that the fall of prices is due to the scarcity of gold. I point out that there is abundance of gold accompanied by a great fall of prices.

38,798. Upon that point I think you told us that what measured prices was the 1,720 millions of gold in the world?—No, I did not say that. I said the gold sovereign measured prices.

38,799. I think you also admitted to me that it was this great mass of gold which measured prices?—The great mass of gold affects the value of the sovereign, inasmuch as it is the supply.

38,800. And therefore indirectly it measures the whole?—It affects the value of the standard.

38,801. On the question of labour, from which I had diverged for a moment, is it not possible that there may have been a great number of other circumstances to account for the fact that the wages of labour have increased, and that wages would have increased still more than they have done if it had not been for the appreciation of gold? For instance, do you think that the trades unions, supported by powerful strikes occasionally, have had no influence in maintaining or increasing wages?—I think the effect of the trades unions is much exaggerated, and the fact that agricultural wages have risen is a strong confirmation of that opinion.

38,802. You still contend, then, that agricultural troubles are purely due to competition—that they were only what was to be expected?—I think so.

38,803. And nothing whatever to do with the gold standard or changes in money?—No, I think not.

38,804. I shall want to ask you, I am afraid, to refer for a moment to another paragraph in that report. In section 95 of the second part of the Report of the Gold and Silver Commission, you say, "So far as the fall in "prices can be connected with the currency, it cannot "be denied that it is attended with great inconveniences"; but that rather implies that it must have something to do with the fall in prices?—I should have thought that was a very cautious sentence: "So "far as the fall in prices can be connected with the "currency" is a very guarded expression.

38,805. Then I must ask you to go to another paragraph—in section 99:—"We may summarise our conclusions upon this part of the case as follows: We "think that the fall in the price of commodities may "be in part due to an appreciation of gold; but to "what extent this has affected prices we think it "impossible to determine, with any approach to "accuracy." Now I understand you to have told me just at this moment that it has nothing whatever to do with currency?—I express myself more positively now than we expressed ourselves then; but I think you should read the following sentence: "We believe the "fall to be mainly due, at all events, to circumstances "independent of changes in the production of, or "demand for, the precious metals, or the altered "relation of silver to gold."

38,806. But that is hardly compatible with the statement you have made?—I am more positive now than I was then.

38,807. You have rather changed your opinion?—No, I have not changed my opinion. I have confirmed it.

38,808. I cannot quite call that a confirmation, when you tell me in your report that it has had something to do with appreciation, and when to-day you say it has nothing to do with it?—Sometimes a single person can express himself more decidedly than six persons can.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,809. I suppose you accept the full responsibility of these statements to which you have put your name?—Yes; but we live and learn.

38,810. However, your view is substantially what it was then?—It is substantially the same as in paragraph 99.

Effect on prices of the divergence in values of gold and silver.

38,811. I want to go to another paragraph as to the effect of the divergence in the metals. I think you have admitted that that possibly may have had some effect upon prices?—It may have had a temporary effect upon prices. I think it has on the whole had very little effect upon prices.

Effect on fall in value of silver on exports of silver countries.

38,812. I observe that in your article in "The National Review" for October, on page 167, you say, "It is said by the bi-metallists that the fall in silver "operates as a continuous premium on the exports of "silver countries." Where do you find that statement on the part of the bi-metallists?—I am very glad to hear that they do not say that; but it certainly has been my impression that that has been one great part of their case. I think you would find it said very positively—now I remember—by some bi-metallists, who answered me in the "Fortnightly Review" of last June; and I think you will find it in many of their writings,—in Mr. Moreton Frewen's writings, for instance, constantly.

38,813. You are acquainted, for instance, with the Bi-metallic Report on the Gold and Silver Commission—there were three reports, if you remember?—Yes; I know the third report.

38,814. May I remind you of the actual words which are used by the gentlemen who signed that report, of which I was one. It is at page 96, at the end of section 9: "We are not prepared to say, and it is not "our view, that the fall in exchange can operate permanently as a bounty on Indian exports, or as a "protective duty against imports; but it is obvious, "first, that the loss which it occasions to the producer "in gold-rising countries, whatever that may be, must "continue to operate until there has been a general "adjustment of the prices of commodities, or in other "words, until all prices and all the incidents of production have on an average fallen in the same "proportion; secondly, that the measure of that loss "is the difference between the purchasing power of "the higher price received for commodities before the "fall and that of the price received at present; and "thirdly, that the date of such a general adjustment is "uncertain, but will probably be remote, and may be "postponed for an indefinite period of time"?—I do not agree to that.

38,815. Which part of it do you not agree with?—I do not agree that it can be postponed for an indefinite time; I think it operates almost immediately, although it is extremely difficult to trace.

38,816. You say it operates almost immediately, but this fall in silver has occurred for a great many years now, and yet I do not understand you to say to the Commission that there has been a general adjustment of the prices in India?—I give in that article—I will not trouble the Commission with reading it now—the indirect way in which the adjustment takes place. I gave you yesterday a statement of the way in which the adjustment takes place in Chili with a depreciated currency. It takes place in all kinds of ways which you do not trace. What I say is, that you can in no case trace any substantial increase in the trade or export of a country to the depreciation of its currency.

Effect of depreciated currency on individual producers in India.

38,817. Quite true, and that I do not think I should dispute with you. When you say, as you said yesterday, that the theory involves the absurdity that a country can grow rich by depreciating its currency, and the absurdity that a real profit can be created by a falling exchange, I am quite willing to make you a present of all that; but what I want, not for the sake of controversy, is really to ask you to examine with me for a few moments, what is the real effect upon the individual producer in a country which has a depreciated currency. I asked you a question on that point yesterday, and there you seemed much less certain. The case was argued in three of the paragraphs in the Bi-metallic Report of the Commission, and I would ask you, if you can, to point out, if there are any, what the

Right Hon. Lord Farrer.
14 Dec. 1894.

fallacies are. At page 95, section 9, the illustration was taken of wheat, and the argument is this: "If "when the gold price of wheat is 40*s.* a quarter, the "rupee, measured in gold, is worth 2*s.*, the producer "of wheat in India will receive 20 rupees for a quarter "of wheat. If the gold price of wheat then falls 25 per "cent. to 30*s.* a quarter, and the gold price of the "rupee falls 25 per cent. to 1*s.* 6*d.*, the Indian pro- "ducer will still receive 20 rupees for his quarter, and "they will purchase as much as they did before, "because prices in India have remained practically "the same." What is the fallacy in that?—In the first place, the 20 rupees will not purchase as much of any European goods as they would before, and whatever the ryot purchases, and he purchases a good deal, there is a very large importation into India of cotton, and a good many other things; for all that he has to pay so much. That in the first place. Then in the second place, he has to pay, in some form or another, to the Government of India, whatever is necessary to make up the loss that they sustained by exchange. It may be that he pays that in the form of additional direct taxation, but as direct taxation in India is the land revenue which is fixed, it is very difficult to raise that. What is the consequence? That the Indian Government has to impose duties upon all the things which the Indian ryot buys, making them dearer to him, and not only that, but it has to shorten its own expenditure upon all sorts of profitable works—things which are for his benefit. It has to retrench its expenditure in improving the government of the country. I know this is the fact from all that we heard before Lord Herschell's Committee. Military expenditure seems to continue. But in all civil expenditure upon public works which the Indian Government does for the ryot and in all expenditure in the improvement of its administration, it has, in consequence of the loss which it sustains by the fall of exchange, to do that which is directly injurious to the Indian ryot.

38,818. Those two points I prefer to deal with separately, and I ask you on the first one: how much does the Indian ryot buy of any European imported goods; are his wants not limited absolutely to the things that are produced in India itself, with regard to which prices have not changed at all?—Not at all. What is the meaning of the enormous export of Manchester cottons to India?

38,819. Then, if the purchasing power of the rupee has not altered——?—The purchasing power of the rupee does alter with respect to what he buys in England; he has to pay so many more rupees for the same quantity of Manchester goods than he would have paid but for the fall in silver.

38,820. (*Mr. Giffen.*) Have not English goods fallen as a matter of fact?—English goods have fallen in consequence of improvements in production.

38,821. (*Mr. Chaplin.*) No matter by what cause they have fallen, he gets the same amount of things for the same number of rupees; is that not so?—I should doubt whether that would be the case. If you take the things of which the gold price in England has not fallen, you will find that he has to pay more. As far as exchange is concerned, it is quite obvious that he must have to pay more, not necessarily actually more, but more than he would have paid but for the fall in exchange.

38,822. With regard to the things exported to India, the same effect is produced by exchange, only in the inverse way. The price here, I understand, falls—that is borne out by the statistics of the prices of almost everything—and consequently we arrive at this conclusion: that when the Indian ryot buys with the unaltered number of rupees that he gets for his wheat, he buys as much as he did before?—But the Manchester producer will not go on producing at a loss.

Positions of English and Indian wheat growers compared.

38,823. That is another pair of shoes; that may be; but I do not want to know anything about the Manchester producer. I am now talking about the position of the grower of wheat in England, as compared with the position of the grower of wheat in India?—Then I say to you, as regards exchange in England——

38,824. I do not care about the exchange; I want to know the position of these two men?—You are talking about exchange, and if you have that in one way you must have it in the other. Whatever he buys, he pays more for.

38,825. How can he pay more, then, if the gold prices have fallen?—If the gold price has fallen, then it will have fallen for other reasons.

38,826. It does not matter what reason it has fallen for; the effect is exactly the same?—I am taking this particular cause—exchange; a country exports so much, you say; it is able, in consequence of the fall——

Right Hon. Lord Farrer.
14 Dec. 1894.

38,827. I make you, as I said before, a present of all the effects upon the country at large. I want to draw a great distinction between the producer in the one country and the producer in the other, and the general effects upon the trade of the country as a whole?—I gave you yesterday an instance of Chili.

38,828. Cannot you keep to the instance of India?—It is the same thing. The purchasing power of the Indian ryot in England is diminished by the fact that his rupee has no longer the same gold value that it had.

38,829. Then how can you reconcile that with the statement to which you put your signature in this Commission, that the purchasing power of the rupee had not altered?—"The purchasing power of the rupee?" that is in India.

38,830. Exactly, and I am speaking of India?—We never said that the purchasing power of the rupee over English goods had not altered.

38,831. You said in India; and what I wanted to point out to you is that where the ryot, of whom we are talking at this moment, spends his rupee is in India; he does not spend it in London?—No; but if he buys English goods he has to pay English prices for them.

38,832. Certainly; and those prices, we know, have fallen?—Yes, we know they have fallen.

38,833. And therefore he gets exactly the same for his rupees as he got before?—That is so; but he does not get the same as he would have got if there had been no fall in exchange.

38,834. That is sufficient. He gets the same number of rupees, and they buy as much as they did before. Now, what is the position of the English producer. The price has fallen from 40*s.* to 30*s.* Can he buy as much with 30*s.* as he bought with 40*s.* Perhaps this is a point you have hardly thought out recently. If so, I wish you would think it out, for I am certain you would come to the same conclusion as I have?—I am pretty sure that I should not. The difficulty is to confine yourself to the effect of exchange, and not to take into consideration the other things which may have affected the rise or fall of prices. So far as exchange between two countries goes, the effect must be equal on both sides. If the rupee loses in gold value it will buy less of commodities that are measured in gold.

38,835. Certainly, but they are not measurered in gold in India; they are measured in silver?—Manchester does not measure its profits or its goods in silver.

38,836. We are speaking of the position of the ryot; he buys with rupees; he buys commodities which are measured in rupees—in silver?—Then the answer I think to that is; that if silver had not fallen in value, he would have paid less; so that he practically does pay more in silver.

38,837. May I give you what I believe to be an answer in a paragraph which again is signed by you, and which I believe is the true version, only it appears to differ rather from the view which before this Commission you have held up to now. This is the way this question is argued at section 87 of the second part of the report: "We do not think the term bounty is in "any view properly applicable. If the silver price of "wheat in India is no higher than it was, its growth "can be no more profitable, and there is, therefore, "nothing to stimulate increased production. At the "same time, it must be admitted that the Indian "producer is for the time in a somewhat more favour- "able position than his English competitor. The "elements which go to make up the costs of produc- "tion in India being payable in silver, and not having "materially increased, the Indian producer, supposing "him to obtain the same silver price, is in substan- "tially the same position as before, even although the "gold price of silver has greatly fallen. The gold "price of his produce has fallen, but so has the cost of "production as measured in gold." Then you go on to say: "The English wheat grower, on the other "hand, who receives the corresponding gold price, "that is, a lower price than before, is in a worse "position, except so far as he can reduce the cost of "production in the same ratio as the price of the pro- "duct. That is to say, unless there is a fall in rent,

Right Hon. Lord Farrer. Dec. 1894.

"taxes, wages, and the other elements of which the "cost of production is made up, proportionate to the "fall of price, he is at a disadvantage as compared "with the Indian producer; and as it can hardly be "contended that this adjustment has as yet completely "taken place, there can be no doubt that the English "wheat grower is for the present placed at some "disadvantage"?—I do not dispute that statement. It is consistent with what I have been saying about the effect of depreciation on wages. But I doubt the inference you draw from it; and I think the statement needs additions and qualifications to make it complete.

38,838. This is quoted from the second part of the report of the Gold and Silver Commission, signed by Sir Thomas Farrer, as you then were?—I think I have shown you that there are other ways in which the ryot must suffer in consequence of the fall in silver.

38,839. I have now quoted a paragraph from the second part of the report of the Gold and Silver Commission, signed by yourself, which showed that the divergence between the metals had had this effect at all events, that there was no doubt that up to the present, as adjustment has hardly yet completely taken place, the English wheat grower has been placed at some disadvantage?—May I call your attention to this—I had quite forgotten that that was so, that I added a note to that report: "I wish to add for the sake, not "of dissent, but of distinctness, that I do not believe "that the change in the relations between gold and "silver currencies has lowered English prices."

38,840. But that does not alter the fact that whether it has lowered prices or not, at present prices, under the existing circumstances, the English wheat grower is placed at a disadvantage; that was the paragraph to which you put your name?—I think what I have just read was with reference to that paragraph. Look at page 93.

38,841. I am quite aware of it, I know perfectly what the paragraph was. That paragraph refers to, and relates solely to, what has caused the fall in prices. This paragraph, which I have quoted from you, relates purely and entirely to one of the effects of the fall, no matter what caused it?—I wished to make it clear that I did not think the fall in exchange had given the foreign producer such an advantage over his English competitor as to make English prices lower.

38,842. Of course, if you wish to put that in as your explanation, I will accept it?—I am not very much concerned about my consistency, for upon this subject I have been feeling my way in the dark.

38,843. Then if you will permit me, I will take it that you still adhere in the main to the statement in this paragraph 87 of the report?—Subject to the qualifications I have mentioned, and subject also to the further qualification I have stated in my examination-in-chief with respect to the effect on the purchasing power of a nation of a depreciation of its currency. (*See* Question 38,478.)

38,844. That being so I should deduce this inference myself, whether you agree with it or not, that the divergence between the metals has had some effect, at all events, upon the position of the English producer?—I very much doubt whether it has; my own opinion is that it has not—that what has affected that position have been causes very different and much more obvious.

38,845. But if I were to accept your paragraph signed by yourself in the literal meaning, I suppose I must assume that the English wheat grower is placed still at a disadvantage, unless you can show me that the adjustment of prices referred to has taken place?—You must take it with my qualification.

Divergence in values of Gold and Silver.

38,846. Silver and gold remained practically steady for a great number of years, did they not?—Yes.

38,847. Until the mints were closed?—Yes.

38,848. And that was in spite of much greater variations in the relative production of these metals than have ever occurred since?—I am not sure whether greater than have ever occurred since, but in spite of great variations.

38,849. You would not be prepared to say that the variations, if we refer to the statistics of past days, which I am convinced was the case, would be seen to to have been considerably greater?—They may have been, I do not admit or deny it.

38,850. Now to what do you attribute this great divergence in the metals?—To the causes mentioned in our report.

38,851. On that point?—I believe that the break of gauge caused, I will not say by the abandonment of bi-metallism, but by the French giving up silver, was the main cause.

Right Hon. Lord Farrer. 14 Dec. 1894.

38,852. By the closing of the mints?—The closing of the mints to silver.

Effect of abandonment of bimetallism on relative values of gold and silver.

38,853. I take it that what you refer to is the closing of the mints to silver by France and the other countries of the Latin union which occurred at that time?—Yes.

38,854. I think we ought to have it on the notes, because this is the report which the whole of the Commission signed unanimously. I will, therefore, ask you whether you still adhere to the opinions expressed in section 192 of part 1.: "Now, undoubtedly, the date "which forms the dividing line between an epoch of "approximate fixity in the relative value of gold and "silver and one of marked instability, is the year when "the bi-metallic system, which had previously been in "force in the Latin union, ceased to be in full operation, "and we are irresistibly led to the conclusion that the "operation of that system, established as it was in "countries the population and commerce of which "were considerable, exerted a material influence upon "the relative value of the two metals. So long as that "system was in force we think that, notwithstanding "the changes in the production and use of the precious "metals, it kept the market price of silver approxi-"mately steady at the ratio fixed by law between them, "namely 15½ to 1." I understand you still adhere to the views expressed there?—I do not depart from them. You must take it, of course, as not meaning more than it does, and as having regard to the fact that France had a large quantity of both metals to dispose of. If France had become entirely a silver-using nation, or entirely a gold-using nation, her power of maintaining the ratio would have ceased at once. And you must take it, subject to what I have said in my article, that I believe what really happened—and I speak about this with hesitation—was that the nations had not made up their minds whether they would have silver or gold, that so long as any of them were willing to have either the one metal or the other, and kept their mints open to it, and had the other metal to dispose of, so long that fact that the mints were open was a sign and means of their willingness to take either metal, and in that way it did maintain the ratio.

38,855. (*Mr. Giffen.*) What is your view as to the date when the bi-metallic tie came to an end in France?—I look principally to France.

Closing of French mints.

38,856. What was the date in France?—France first took American silver when America altered the ratio; she then took gold when it became the cheaper metal; she parted with her silver; and then being afraid that she should have to part with her gold she stopped the mints.

38,857. What date do you fix for the stoppage of the mints in France?—It was done by degrees; I cannot give you the exact date, but it was not done all at once.

38,858. Was not France an inconvertible paper country from 1870, when the mints were not practically open?—That is perfectly true; that was a step.

38,859. (*Mr. Chaplin.*) The facts, I think, are these; that France began—though I cannot recollect the exact date at this moment any better than you—by limiting the coinage of silver?—She did.

38,860. From that date, it is held by bi-metallists that the bi-metallic system ceased to exist?—She had made up her mind that, having got gold, she was not going to part with it.

38,861. (*Mr. Giffen.*) The inconvertible paper began in 1870, did it not?—I think so; but I do not remember the exact date.

38,862. (*Mr. Chaplin.*) It is the essence of bi-metallism, I understand you to say, according to the views of the bi-metallists, that mints should be open to the free coinage of the two metals?—Quite so.

38,863. On the date, then, when the coinage of silver was limited, bi-metalism ceased to exist?—To that extent, and of course it ceased to exist completely when they closed the mints.

38,864. It was after that, in the year 1873, I think, that the mints were actually closed?—Yes; they made up their minds that they would not part with their gold.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,865. There was also another reason, I think, which was given at that time in section 193 by the Commissioners as a body for thinking that the ratio could be maintained, an *à priori* reason which was to this effect, I think, was it not: "The fact that the "owner of silver could, in the last resort, take it to "those mints and have it converted into coin which "would purchase commodities at the ratio of 15½ "of silver to one of gold, would, in our opinion, be "likely to affect the price of silver in the market "generally, whoever the purchaser and for whatever "country it was destined. It would enable the seller "to stand out for a price approximating to the legal "ratio, and would tend to keep the market steady at "about that point"?—Yes, so long as the nations adhered to their bi-metallic currencies, and lead the dearer metal to dispose of.

Maintenance of the ratio.

38,866. If that system had all these effects then, what is there to prevent it having exactly similar effects now, providing the nations were willing to adopt it, and adhere to it?—I have already said that it might have similar effects, if the nations having large stocks both of silver and gold, and including in the nations the subjects of the nations as well as the governments, were willing and ready to adopt it.

38,867. It could be done again?—It could under those circumstances be done again. But you cannot set "Humpty Dumpty" upon the wall again, I believe that to be impossible; and I believe, and I think that it would not be fair if I did not express what is the tendency of my own opinion upon the subject, that the whole tendency of the world has been towards a gold standard; that nation after nation has adopted the gold standard—very often in the teeth of the action of their own governments—and that it was only so long as they were ready to adopt silver, and the general feeling, habits, and opinion were in favour of silver as well as gold, so long the open mints were the means of their giving effect to their wishes and habits.

38,868. Upon that point of the probable attitude of the nations upon this question, did you follow carefully all the proceedings of the Brussels Conference?—No, but I have looked with great anxiety at what is doing in the United States.

38,869. You would not be able to say whether the opinion which I hold from a careful—a very careful—perusal of all those proceedings at Brussels is correct, namely, that it was almost entirely owing to the attitude of England that the nations did not come to some agreement—you cannot say that?—No, I cannot say that.

Effect of bi-metallism.

38,870. I do not propose to refer any further to the question whether bi-metallism is practicable or not; that we have disposed of; but referring to paragraph 70 in your brief, in which your conclusions are stated, I am not quite clear what you mean by "degrading" the gold standard?—As far as I understand it, the case of the bi-metallists is not simply that they wish gold and silver to exchange at a given ratio, but that they wish to make silver exchange for gold at a higher ratio than that at which it now exchanges. The effect of that would be immediately to degrade the gold standard. I am not quite certain as things are at present, whether the addition of all this quantity of silver to the gold, whatever your ratio was, would not ultimately degrade the gold standard—I am inclined to think it would.

38,871. If the ratio accepted was either the market ratio at present, or the market ratio we will say at any given day, that would remove your objection, I understand?—It would remove one objection.

38,872. As to its degradation?—For the moment; but I am inclined to think that the addition of all this quantity of silver to the metal which formed the standard, must in the end have the effect of degrading the standard, and that the standard would be lower than it would be otherwise.

38,873. Does that mean the prices would be higher?—Prices would be higher.

38,874. How could that be; how is it possible for you to contend, after that final note to which you have just called my attention, that the effect of these monetary changes had done nothing to lower prices; surely if these monetary changes had no effect in lowering prices, it is not open to you to contend that they would have an effect in increasing them?—What I have said is that the difference between gold and silver has not lowered gold prices; I do not say that the addition of all the silver in the world to all the gold in the world, as the standard, would not raise prices.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,875. Would not raise them?—Would not raise them. The subject is extremely obscure and speculative; and if bi-metallism were adopted, and were to work as its advocates think it would, I should not at all wonder if they were very much disappointed with any effect it might have in raising of prices. It is extremely obscure. I recommend to your notice a passage in the book of Taussig's, which I have put before you, in which, I think, he puts those questions admirably.

38,876. I will read it with great pleasure. It follows, I think, from what you have just told us, which is rather important, that if in your opinion the addition of all the silver to all the gold in the world would raise prices, the fact of the taking away of that silver from all the gold in the world, to some extent has lowered them?—It may have done so.

38,877. Is it so, or not?—All the silver has not been taken away.

38,878. I mean taken away in the same sense that you speak of when you say "added to"; you are unable to say anything more about it?—The question is so wide and so speculative that I find a difficulty in stating it precisely, much more in answering it. You have first to consider what is all the stock of gold in the world, and then what is all the stock of silver in the world. You have then to consider what is the value of the silver measured in gold; and then the question arises whether the value is to be taken at the present market value of silver, say, 30 to 1, or at the value before the breach of the bi-metallic tie, say, 15 to 1. You have then to consider what is the present aggregate demand for gold, and what is the present aggregate demand for silver; and, lastly, whether, if silver could again be combined with gold by the bi-metallic tie at some given ratio, the aggregate demand for the two metals taken together would be greater or less in proportion to the aggregate supply than the present demand for gold in proportion to the aggregate supply of gold.

These are questions which I cannot answer, and which I do not believe anyone can answer. But there is one thing which I can point out to you, viz., that the present stock and supply, both of gold and of silver, much more of both taken together, is enormously large—much larger than it ever was, even at the time of the great gold discoveries—infinitely larger than it was in the first half of the present century.

And according to the figures of the Director of the United States Mint, which I have put in, the total additions tothe stocks of the world, have been as follows:—

	Gold.		Silver.	
	Five Ounces.	Value.	Five Ounces.	Value at 60*d.* per Ounce.
	£	£	£	£
From the discovery of America down to 1850.	152,779,050	648,905,483	4,816,930,012	1,204,232,503
From 1850 to 1893.	253,444,899	1,076,468,460	2,846,479,704	711,619,926
Totals -	406,223,949	1,725,373,943	7,663,409,716	1,915,852,429

I take 5*s.* per ounce as the value of the silver, as this approximates to the market value previous to the rupture of the bi-metallic tie.

Making every allowance for waste, for hoarding, for use in the arts, and increased consumption of every kind, these figures, if even approximately correct, show what immense additions have been made in the last 40 or 50 years to the world's stock of gold and to the world's stock of silver, additions which at the present moment are still rapidly increasing; and they are enough to make us pause and consider seriously whether on the ground of a supposed deficiency of gold for monetary purposes we are prepared to add to our present enormous stock of gold the equally enormous present stock of silver, and to attempt to combine them in a sort of amalgam for monetary purposes by a new and precarious bi-metallic tie.

38,879. That is the only answer that you can give?—That is the only answer that I would make. It is a very difficult speculative question.

Right Hon. Lord Farrer. 14 Dec. 1894.

38,880. Is it really true that you think it is little less than wicked—especially after what you have just told us about the possible effect on prices—to attempt to persuade poor farmers and cotton spinners that they would be relieved of their present difficulties by giving them more counters, by which I understand you mean adding all this silver?—Yes; I do think that it would be wicked for anyone who looks at this matter as I do to tell them what is happening to them arises from currency causes, and can be remedied by increasing the currency.

38,881. If you are unable to tell us positively that the addition of all this silver will not have the effect of raising prices if, as appears from what you have just said, it is very difficult, and you seem to have some doubt upon it, why is it wicked for those who have no doubt upon it to tell farmers and cotton spinners that it will have this effect?—Because I do not think that raising prices, if you did raise the prices, would have the effect of restoring their prosperity.

38,882. Then it is not wicked to tell them that it will have the effect of raising prices, but it is wicked because, if prices were raised, in your opinion that would not be a good thing?—It would not be a good thing.

38,883. That is where the wickedness lies?—I do not think it would be a good thing to raise prices by those means, and I am not at all sure that prices would be raised. I cannot tell what the effect would be.

38,884. On the assumption that they would be raised, of course you understand that if prices were raised, the chief cause of the agricultural difficulty, as it has been represented to us by all the evidence before this Commission, would disappear?—Oh! dear no; not if all other prices were raised at the same time.

38,885. That is the evidence which has been given before us. Why is it wicked of me?—Suppose that the price of all farm stock was doubled at once, and suppose that everything the farmer had to buy was doubled——

38,886. (*Chairman.*) And wages too?—Wages and rent too; how would he be better off?

38,887. (*Mr. Chaplin.*) Does not the farmer conduct his business with the capital which he has invested, and for which he expects to get a certain return, that return depending entirely upon the prices of the day?—Yes, and suppose the prices of the day are altered—all prices—both what he pays and what he receives, then how is he better off?

38,888. But the prices which affect him are the prices which pay the interest on the capital which he has invested in respect of which he is a debtor?—You want to alter some prices and not other prices.

38,889. No, I do not say that?—If you raise the prices of the things that he sells, and do not raise the prices of the things that he buys, he will undoubtedly be better off. My objection to your proposals is that it would to some extent have that effect, and that in raising prices you would be lowering wages.

38,890. Am I to understand that this is what you mean—that it is wicked of myself and other sinners who think like me, to recommend this to farmers, because even if it had the effect of raising prices that would do them no good; is that what you mean?—To a person who looks at the thing as I do.

38,891. To an ordinary person, a man like the farmer?—I do not accuse you of wickedness.

38,892. You speak of counters. I suppose there are gold counters as well as silver counters?—Yes.

38,893. Is it wicked to make them any proposition about the increase of gold counters?—I do not think they would be any better off from an increase in the number of gold counters.

38,894. That is not the question. I am confining it to my delinquencies; is it wicked?—I think it would be wicked to persuade them that they would be better off by the doubling of all the gold counters in the world.

38,895. Is it not a very generally expressed opinion and idea, even among eminent monometallists, that it is very desirable that the gold discoveries which are going on now should be increased to a very large extent; is it not accepted as rather a subject of universal congratulation that there has been this increase in the discovery of gold recently?—It makes people very cheerful; whether there is any real advantage in it I do not know.

38,896. There is nothing wicked in exulting over it?—No.

Right Hon. Lord Farrer. 14 Dec. 1894.

38,897. Or in telling the farmers that it is a good thing for them, is it?—If it is; but is it?

38,898. Whether it is or not, is it wicked in your opinion to tell the farmers that they ought to expect——?—It would be wicked on my part to tell them I thought it would make much difference to them one way or the other.

38,899. Is there any distinction in the wickedness which arises on this question between advocating to them an increase of the gold counters and an increase of the silver counters?—No, no difference whatever.

Effect of discoveries of gold.

38,900. (*Mr. Everett.*) About the effects of the large discoveries of gold. Has your attention been called to what Newmarch says on that point and the conclusion he arrives at. I will read it to you, it is very short: "Generally we are justified in describing the "effects of the new gold as almost wholly beneficial. It "has led to the development of new branches of enter- "prise; to new discoveries; and to the establishment, "in remote regions, of populations carrying with "them energy, intelligence, and the rudiments of a "great society. In our own country, it has already "elevated the condition of the working and poorer "classes, it has quickened and extended trade; and "exerted an influence which, thus far, is beneficial "wherever it has been felt"?—Are the conclusions justified by evidence and facts?

38,901. Would you agree or dissent?—I should be disposed to agree. But you must remember that Mr. Newmarch had been arguing against the people who thought that the gold discoveries were going to ruin us. He did not believe them, and he would not, I am sure, believe those who think scarcity of gold is now ruining us.

Appreciation of gold.

38,902. I understand you do not think that we are at the present time in the presence of the phenomenon known to economists as appreciation of money?—No, I do not think we are.

38,903. Do you believe that money does, at certain times, appreciate, and at others depreciate as compared with other commodities?—There is no such thing as an absolute fixed standard, and therefore it must fluctuate.

Purchasing power of gold measured by labour and commodities.

38,904. What is the best measure of fluctuations in money do you think?—That is an extremely difficult abstract philosophical question, and I doubt whether it is possible to give any positive answer to it. Many economists, both the old economists and the modern economists, think that the best ultimate standard is a certain quantity of human effort, which is of course a perfectly impracticable standard.

38,905. Commodities have usually been taken as its measure, have they not?—Yes, I think very improperly.

38,906. I see you rather object to our quoting the prices of raw material and wholesale prices. Now I should like to ask you if gold and silver are not themselves raw materials, and cannot you gauge what happens to a raw material better by comparing it with other raw materials than by comparing it with something into which a lot of other elements enter?—You have got to compare gold, if it is your standard, with everything which it measures; it is not a question of which it is best to measure it with, but you are bound, if you wish to know what its purchasing power is, to measure it against everything that it purchases.

38,907. Cannot you detect the change that is due to alterations in the commodity itself—I am speaking now of the commodity gold—by comparing it with other similar commodities rather than by comparing it, for instance, with labour, into which moral considerations enter?—I do not think so. When you come to the modes in which gold and other commodities are supplied they are so very different that I do not see any reason why you should measure gold against wheat more than gold against labour.

38,908. When you measure gold against the whole wide group of other raw commodities, surely you have as good a measure as can be applied to detect whether the change has taken place in the gold or in the commodities?—You measure it against those particular commodities, but you ought equally to measure it against everything else which it purchases.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,909. What is price in the English language—what do we mean by price?—Price means the measure of value in gold of anything whatever which is purchased.

Definition of price.

38,910. When we sell we barter the commodity we are selling for gold?—We measure it by gold.

38,911. We barter it for gold?—We do not barter it for gold, because gold does not pass, but we measure it by gold.

38,912. If I take a cheque I have taken gold virtually have I not?—No, you do not take gold at all, you take a promise to pay sovereigns, which for your purpose of barter answers just as well as gold sovereigns.

38,913. I think I heard you tell Mr. Chaplin that a cheque for so many sovereigns was substantially so many sovereigns?—It is equivalent to so many sovereigns for the purpose of barter, but you do not actually exchange gold at all, the gold is not used.

38,914. Whether you take a cheque, or a bank note, or a sovereign, the price is the gold, and the gold measures the price?—Yes, but it is credit money.

38,915. Still you would admit that while gold is our standard, gold is price?—Price is measured in gold.

38,916. And that gold is half of every bargain that is made?—No, I do not admit that. I admit that price is measured in gold, but when we pay by cheque the gold does not pass.

38,917. But the right to it—the command over it—passes?—Yes, that is so; but you do not exercise your power over the gold. It is not used, and there is no demand for it.

Effect of changes in value of gold on prices of commodities.

38,918. What surprised me in your notes is this: that you appeared to think that if a change has taken place in the value of gold that it ought to have affected equally the price of all commodities. Now inasmuch as gold is only half the bargain, the commodity being the other half, is it not plain that circumstances affecting the commodity would affect the ultimate price as well as circumstances affecting the gold?—That is my argument.

38,919. And therefore you would not expect that an alteration in the value of the metal would equally show the alteration in the price of all other articles?—Yes, I should. If the same substance is measured against all the articles, it must, so far as any alteration in it is concerned, have the same effect as against them all.

38,920. In your brief you argue as if the effect of that must necessarily be, if gold were rising, to lower the prices of everything, not lowering them as compared with what they would have been, but lowering them altogether below the standard at which they had previously been?—It must lower them *pro tanto*; but what the actual price would be will depend also upon the circumstances affecting the commodity itself.

38,921. The circumstances affecting the commodity form half the terms of the price ultimately arrived at, you have the gold half and you have the commodity half?—Yes. If gold rises or falls in value it will to that extent cause an alteration in the price of every commodity.

38,922. But it will not necessarily follow if gold is rising in value that the price of every commodity will fall to a lower level than it stood at before, will it?—The commodity may have been rising from other causes.

38,923. Your brief seemed to use it, and your article in the "National Review" too, as an argument against the appreciation of gold, that while the great bulk of commodities had fallen there were some which had not fallen, but which had actually risen?—The whole of what I said upon that subject, and what I have said in my evidence, has been to the effect that I thought the real thing which had moved prices was what had happened to the commodities themselves, and as each commodity varies, so would the effect upon price vary.

38,924. You will pardon my saying that you do in your brief and in your article absolutely affirm that the fact that all prices have not fallen is a strong condemnation of our statement that gold has appreciated?—Certainly, most undoubtedly, if you include prices of labour and of services.

38,925. And commodities?—The fact that you have a great variety in the fall of prices and commodities shows what a great variety of circumstances there are that affect the commodities apart from anything which affects gold. Anything which affects gold must affect all equally.

38,926. That is exactly what I wanted to come to; that, looking at the fact that money is half, but only half, of the ultimate terms of the price of commodities, it is not at all to be expected that we should see a uniform fall in the price of all commodities with an appreciation of money?—No; because the circumstances which affect different commodities are so different.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,927. In some cases circumstances affecting the commodities are stronger than the circumstances affecting the gold?—I say they are almost always stronger; that is my impression. I can illustrate what I mean by this; some things have risen—take coffee; coffee has risen in price. Supposing that 30 per cent. of the fall in prices is due to gold, you would have to add that to the price of coffee which has risen 30 per cent., and its price, if gold had not changed, would be 130.

38,928. The simple point I wanted to arrive at was that, looking at the fact that money is only half the bargain, it is not a thing at all to be expected that everything would fall alike, that is, that there would be a fall in price of everything measured by money, because circumstances affecting certain particular commodities like, for instance, the drought affecting the hay crop last year, might be far stronger than the influence which was appreciating the money?—That is my argument.

38,929. Only you will pardon my saying you affirm very differently in your article, and I think also in your brief?—That is my meaning at any rate.

Changes in prices in last three or four centuries.

38,930. Do you know enough of the history of prices in the past to know that there have been great changes in the general level of prices in the last three or four centuries for instance?—I have found so much difficulty in understanding the phenomena of the present day, which are under my eyes, that I really have not attempted to understand the phenomena of the past, and I am afraid it would be idle to ask me questions about what happened in the last two centuries.

38,931. You are not aware that the opening of the great silver mines of Potosi led to a rise of prices to four or five fold what they had been when Queen Elizabeth came to the throne?—I am afraid it is no use asking me questions about that.

Prices between 1797 and 1819.

38,932. Are you not aware what happened to prices in this country from 1797 to 1819 when we were on inconvertible paper?—I have read in former days, but not lately, that admirable book, Tooke's "History of Prices."

38,933. There was a great inflation of prices, was there not, in those 20 years?—The effect of Tooke's book, if I remember right, was to show that people had attributed far too much importance to the currency, and far too little importance to all the different circumstances that affected the different commodities.

Effect of opening of American silver mines on prices.

38,934. Still, it is the historic fact at all events that, following the opening of the great silver mines in America, we had two centuries of prices standing at about four or five times the level they were when Queen Elizabeth began to reign, and that, when we went on to our inconvertible paper money in 1757 we had then 20 years of very much higher prices still?—I daresay that is so. I will willingly take it from you, but I would rather not say anything about it.

38,935. You are not aware whether economists, without exception, attribute that great rise of prices in the seventeenth and eighteenth centuries to the output of silver?—No; I would rather not say anything about it.

Fall of prices after 1819.

38,936. You have a better acquaintance probably with modern history, and I would ask you whether you do know that after we returned from our inconvertible paper to a metallic standard by a law passed in 1819, there ensued a great fall in prices, and prices stood after that on a lower level for many years?—I believe that was so.

38,937. And that those lower prices were not very great blessings to industry and agriculture in the country?—We were then suffering from the collapse after the great war, and I know there were great periods of distress.

38,938. And it was the lower prices not the higher ones which made it?—Whether it was due to currency causes or not is quite another question.

38,939. After the great gold discoveries began, there ensued a revival of our industries, did there not, two or three years after, or three or four years after they began?—Yes, but the whole period before had not been

Right Hon. Lord Farrer.
14 Dec. 1894.

a period of distress, nor has the period subsequent to the gold discoveries been all a period of prosperity.

38,940. I quite agree with you. When those gold discoveries proceeded, the output of gold was so large; I think from the figures you gave us that the existing supply of the world, was something like doubled in 20 years?—Yes, I think it was even more than that.

38,941. That probably had the effect of degrading our standard, had it not, in the sense in which you have been using that word?—Yes, I should think it probably had some effect.

38,942. And that degradation was attended with extraordinary prosperity, I think?—Yes, but whether greater prosperity than since, I do not know. We must remember that this degradation, if we are so to call it, I do not like to use the word where it arises from natural causes, but this degradation so to speak, this addition to the supply of gold, has been going on ever since, all through this period of falling prices of which so much complaint is made.

Effect of demonetisation of silver.

38,943. You are aware that about 1873, there began to be restrictions put upon the free use of silver, by many of the leading nations?—They no longer used it as freely as they had done before.

38,944. Are you aware that when that leap in the dark was taken, the Baron Rothschild of that time expressed himself to this effect at Paris in 1870. "The "simultaneous employment of the two precious metals "is satisfactory and gives rise to no complaint. "Whether gold or silver dominates for the time being, "it is always true that the two metals concur together "in forming the monetary circulation of the world, "and it is the general mass of the two metals combined "which serves as the measure of the value of things. "The suppression of silver would amount to a veritable "destruction of values without any compensation"?—I did not know the passage.

38,945. Is it not the fact that we have seen a veritable destruction of values to the tune of hundreds of millions, if not thousands of millions, in produce and in lands and mills and industrial property, in iron, ships, and almost all the property of the nation?—No, I do not think so.

38,946. There has been an enormous destruction in agricultural value, has there not?—There has been enormous loss in agricultural value, but whether by reason of the currency is quite a different question.

38,947. But still the effect which Baron Rothschild then predicted, whether as the result of what took place or not, has come to pass, whether by that cause or not?—Then it is a very remarkable fact, as I pointed out to you yesterday, that the production of gold now is as much as the production of gold and silver together were before the demonetisation of silver; so that at this time, if that were so, and the cause of the loss depended on currency, agriculture ought to be recovering.

38,948. I think you will admit that prior to 1873, prices rested upon the joint mass of the two metals, gold and silver; that they were united in marriage bond so to speak, and that prices stood upon the joint mass of the two; the annual addition to which joint mass you tell us is now about to be equalled by the addition of gold alone?—Yes.

Population and the demand for gold.

38,949. Are you aware of the difference between the populations who had gold as their standard at the time the great change was made in 1873, and those who have it now?—No, I could not tell you that.

38,950. I find that when the change was made, prior to that change, the United Kingdom and her Colonies (excluding India) and Portugal, were the only countries with a gold standard, and their population then was under 50 millions; it was 47 millions and a half. The population of the countries which have gold as their standard to-day amounts to 320 millions, which is more than six times as many people requiring gold as their standard now as was so when the enormous change of divorcing the two metals took place?—Yes, But increase of population does not mean increase of demand for gold. There is no fixed relation whatever between them. You have to remember against that the enormous economy of gold which has been taking place by the substitution of credit as your medium of exchange.

38,951. We have already brought out I think in your examination that it is the gold itself that measures price?—It is the standard; when you speak of the nations that use gold as their standard, that can only affect the value of gold by the demand which these nations make for gold, and if instead of using gold they use paper and notes, then the argument which is founded upon the number of the populations falls. I have shown you that England uses less and less gold every year in proportion to her business.

Right Hon. Lord Farrer.
14 Dec. 1894.

38,952. I will come to that in a minute. You will pardon me, but those 320 millions of people whose prices are measured only by gold now are engaged in producing commodities, while formerly we had only 50 millions of people producing commodities to be measured by gold; do you not think that a six-fold multiplication of commodities without any multiplication of the standard by which they are measured would be certain to have an enormous effect on increasing the value of that standard?—It depends upon the extent to which that great increase in the quantity of commodities has caused a demand for gold.

Effect of increased production of commodities on the value of the standard.

38,953. The commodities and the gold measure one another do they not. In the one scale you have the legal tender money, which in this case is gold, and in the other you have all the commodities in the market?—The money used is not legal tender money, and it is not gold.

38,954. If you for 20 years increase those commodities without any increase of the money to measure them, you must inevitably have a great fall in prices? Not at all; if there is no increased demand for the use of gold.

38,955. But there is always an unlimited demand for gold, is there not?—No.

38,956. I know everybody about me desires it and covets it, and works for it every day. Do you not imagine that a multiplication of the consumers of wheat by six—if you can imagine such a thing to happen—would have a most enormous effect on the price of wheat?—Certainly; if you increase the demand for wheat by six fold, you will very much increase its value and its price.

Population and demand for gold.

38,957. Now we have 320 millions of people with gold as their standard, whereas we had only less than one-sixth of that 20 years ago?—That depends upon the quantity of gold which they want to use.

38,958. Of course we know that you can do with ever so little money, but is it not the fact that prices have to follow the reduced quantity of the money?—I do not think so.

38,959. Is that not what has been happening during the last 20 years?—No, I do not think so.

38,960. Have not prices been falling all the while?—I do not think that is due to any scarcity of gold.

38,961. You tell us now that the output of gold is about the same as the annual output of gold and silver together was before?—Yes.

38,962. And this gold now has to do for 320 millions of people what the gold and silver together had to do for 50 millions before?—Perhaps; but that again will depend upon what the demand of those people for the gold is.

English imports of gold.

38,963. Then you refer to the question of England itself. I daresay your attention has been called to the fact that the net imports of gold into England for the 19 years from 1858 to 1876 amounted on an average to a little over 4½ millions a year, and that in the 10 years following 1876, which is after this great monetary change had been made, instead of an annual excess of import we exported on the whole—we lost on the whole—nearly a million a year instead of getting in 4½ millions a year, and taking the 17 years from 1877 to 1893 we imported net only 22 millions as against the 89 millions which we had imported in the 19 years from 1858 to 1876. I take those figures from official sources. Would that not, do you not think, be likely to have a considerable effect on prices in England?—I do not think so, if we did not want the gold. If we had wanted it we should have had it. We have got it now; it comes in, and it does not raise prices.

Stock of gold in Bank of England.

38,964. You may have noticed perhaps that when the Bank of England inquired into the quantity of coined gold in England in 1876 they estimated it at 122 millions, and that a search made at Mr. Goschen's instance in 1889 showed that the stock was reduced to 73 millions?—Yes.

38,965. (*Mr. Giffen.*) The estimate in 1876 was made upon quite a different principle from the estimate

Right Hon. Lord Farrer. 14 Dec. 1894.

of Mr. Goschen to which you refer. If the same principle had been applied in 1876 no such stock would have been made apparent as was then apparent, the two things do not compare?—That may be so; but even if the facts were as suggested, it might only show that people did not carry so many sovereigns in their pockets, but that instead of that they paid their bills by cheques.

Effect of supply of gold on prices.

38,966. (*Mr. Everett.*) I was going to call your attention to this singular coincidence, that along with that great diminution of the quantity of gold in England we have prices gone down between 30 and 40 per cent.?—If you can show me the connection between the quantity of sovereigns I carry in my pocket and prices, then I shall be able to see clearer my way to your views, but I do not see any connection myself.

38,967. I have not yet been able to get beyond what John Stuart Mill says, "That an increase of the "quantity of money raises prices, and a diminution "lowers them is the most elementary proposition in "the theory of currency, and without it we should have "no key to any of the others." You do not accept that doctrine?—That requires a great deal of pulling to pieces before you can agree with it. You want to find out what he means by money.

38,968. He means legal tender money, no doubt. You know, I daresay, that Adam Smith held the same view, and John Locke, and Hume, and Ricardo; then you point as against that to the large quantity of money in the banks at the present time?—Yes, which is not legal tender money.

Accumulation of gold in the banks.

38,969. In regard to an individual if he has got a great accumulation of blood in one part of his body, instead of circulating all over it, that is generally a sign of disease, is it not—it is a congestion of the blood?—That is a metaphor which I am afraid I do not entirely follow.

38,970. As Mr. Chaplin extremely well put to you when all industries broadly speaking are unprofitable, and all property is falling in money value, it looks an exceedingly likely thing does it not that money should come out of circulation and be laid by because people do not know what to put it into for fear of losing it?—Yes; but then it is the want of the spirit of speculation and of enterprise which makes the money useless; and the money being there does not create the spirit of speculation and enterprise. I feel no doubt that if there were a spirit of speculation and enterprise that money would be used. But the fact that it is there, and that you cannot get it into circulation further than by having it in the banks does not create speculation and enterprise.

38,971. Should we not go back a little further and see what it is that has checked the investing of money in property and in industry. You would admit that it is the fall in prices, and if the fall in prices is, as so many economists say, the natural effect of stopping the increase of money while the increase of commodities keeps going on, have you not there an explanation of what looks at the first blush to be a contradictory phenomenon?—If you have as a cause the fact that there is a deficiency of money, and then having the disease you administer a quantity of money, and you find that it has no effect in removing the disease, it is a strong evidence, at any rate a strong presumption, that the want of money was not the cause of the disease.

38,972. You will pardon me, but is it not the fact that this accumulation of money at the bank is not new money come in, but is money that should be in circulation, but which is unhealthily withdrawn from circulation to stagnate at the centre?—I do not think I understand that phrase "withdrawn from circulation;" it is as much in circulation when it is in the bank reserves as it ever is. I do not understand the meaning of its not being in circulation.

38,973. You may have met with that sentence out of David Hume, in which he says, "In every kingdom "into which money begins to flow in greater "abundance than formerly, everything takes a new "face, labour and industry gain new life, the merchant "becomes more enterprising, the manufacturer "becomes more diligent and skilful, and even the "farmer follows his plough with greater alacrity and "attention"?—I am inclined to think that there is a great deal of truth in that speech of David Hume's, and that we are acted upon very much by sentiment; but under present circumstances, the money that would create that sentiment is the money which is the product of speculation and enterprise, the credit money of the banks. If people were to-morrow to begin to believe in a number of new enterprises, then money would increase, there would be credit, future enterprises would be discounted, and everybody would be in a hopeful spirit. That is a good thing if it do not go too far; but when it goes too far, as that spirit often does, then it becomes a very bad thing.

Right Hon. Lord Farrer. 14 Dec. 1894.

38,974. Can you tell me how we are to get that feeling of confidence while prices continue to fall?—I cannot tell you how it is to be got, but I do not believe you will get it by having more money.

Effect of supply of gold on industry and prices

38,975. And yet you freely admit that as the result of, or at any rate coincident with, the great gold discoveries, we had great activity of industry and rising prices?—Yes, as a matter of fact.

38,976. And you hope now, I think, that very large discoveries of gold would give a new stimulus to industry?—It is possible that a new boom in trade and business and a new speculative spirit may arise out of the African discoveries; it is quite possible.

38,977. You think it is possible that they may grow large enough to counteract the effect of the six-fold increased demand for gold which exists to-day?—It is possible that a new spring may come from that source; it is possible it may come from many other sources; but I do not admit the six-fold demand for gold.

38,978. Is it conceivable that the supply will increase enough to make up for the enormously greater demand of all these extra millions of people, 270 millions?—I do not see that there is such an extra demand.

38,979. At any rate, they are all producing commodities and exchanging commodities against gold?—Yes.

38,980. They must have money to exchange them against?—Yes, but they may have that in abundance without more gold. I do not think they are much better off for there being a larger quantity of gold in the world.

38,981. You probably, in your own personal experience, do find yourself better off when you have an abundant supply of gold personal to yourself; your experience as an individual would be that the possession of gold is a comfort and an increased quantity of it is a pleasure?—A good balance at my bankers is a very good thing.

38,982. I might ask you if it is not the case that the general lift of things which followed the gold discoveries led to a general rise in the pay of the army and of the civil servants in this country; that there was an increase made to their pay because it was the general impression that everything had gone up in price, and it was only just to them that they should have more pay?—I will not deny that the addition of gold had some effect, indeed, had a considerable effect, but to what extent any prosperity of that time, or supposed prosperity, was due to gold, and how far due to other causes, of which there were a great many, I am not prepared to say.

38,983. Has your attention been called to what I believe is the fact that it is only the gold standard countries to-day which are suffering under agricultural and general depression?—I am not at all sure of that.

Depression in gold standard continues.

38,984. There has been no testimony of any agricultural depression from India and Mexico?—India has its own troubles in its own form, Argentina has its own troubles, and Mexico (I can speak confidently) has its own troubles in its own form.

38,985. Yes, if they owe gold, no doubt they have troubles; but the agriculture of Mexico, I saw by a consular report from there, was in a particularly flourishing condition?—I do not profess to know the whole history of Mexico, but I do know something of certain enterprises in Mexico, and I know that they are suffering for want of exports and of imports.

38,986. You may know, I daresay, that in the Argentine agriculture, instead of being in depression, is going ahead by leaps and bounds?—It is going ahead very much, but I should be very sorry to say that Argentina was in a condition which we should like to imitate in this country.

38,987. Suppose such a thing is possible as for money to be appreciating, the effects you would expect would be that contracts which had been entered into before

Right Hon. Lord Farrer.
14 Dec. 1894.

the movement took place—contracts in fixed terms of money—would become very much more difficult to fulfil if money was steadily appreciating?—That depends upon the question whether it is the money that has appreciated, or whether it is the quantity of commodities that has increased. If it is the money that has appreciated, ultimately the debtor suffers, but not otherwise.

38,988. Is it not the fact that within recent years the fixed rents of the Irish farmers have had to be broken?—I will admit in the fullest way how hardly all sorts of fixed payments have borne upon agriculturists in this country and in Ireland.

38,989. What I wanted to ask was whether it is not concurring evidence, alongside of the fall of prices, that there has been an appreciation of gold when you find that all people who have entered into contracts in gold, whether individuals or nations, are finding themselves yearly in increasing difficulties?—We were speaking of the agriculturists of this country and of Ireland. What I think they are suffering from is a fall of prices due to the competition of the rest of the world.

38,990. Do you think that the farmers in other gold standard countries competing with us are able to stand these prices?—I understand at this moment that Australia is in much greater difficulties than we are.

38,991. Take the United States farmers?—The United States are suffering, I have no doubt; but there has been a good deal of exaggeration about them, I believe, so I understand from the persons who are best able to speak.

38,992. Does not that look very much as though, instead of the lower prices being due to cheaper methods of production, they were due to some cause altogether outside of that?—No, I do not think so.

Wages of labour.

38,993. In regard to labour, I see you state that the reward of labour, whether of the muscle or of the brain, has increased—even increased in sovereigns—by the operation of the fall in prices during recent years?—Not only by the operation of the fall in prices. The nominal wage has increased as well as the real wage in commodities.

38,994. I should like to ask you whether agricultural products are not the joint product of the brain of the farmer and the muscle of the labourer; and whether it is not the fact that instead of the reward of that muscle and brain being increased in sovereigns, it has gone down something like one-half in sovereigns?—What I said I think was that the wages of labour which are paid in money have increased and not diminished, and I think that is the fact according to Mr. Little's report.

38,995. You referred to the brain too, I think?—I did not say anything about the farmer's brain, I think, though I admit that the brain of the farmer, in superintending labour, is an element in production which ought to be fairly remunerated. The fact is that the labourer has got a larger share of the product.

38,996. Is that not also the case in regard to the cotton manufacture, the iron manufacture, and to shipping? Have not all the results of the joint product of the labour, of the brain, the muscle, and the capital, very much gone down instead of going up?—No, I do not think that the wage of the labourer or the salary of the clerk has gone down. I think it has rather increased. Where he buys those commodities which have fallen he gets an additional advantage; where he has to pay for services there he does not gain that advantage.

38,997. I believe it is the case that quite half the agricultural product is raised by people who do not pay wages at all; you would not say that their labour obtains a richer reward in sovereigns than it did?—No, I do not think it does.

38,998. If agricultural labour here is getting a higher reward it is out of the capital and not out of the product of the industry?—I think the progress of all society seems to show that the labourer gets a larger and a larger share of the nett product. I do not know that that is a bad result.

38,999. Can things go on with more wages being paid than the industry produces?—No, most distinctly not.

39,000. That is just what is happening in the part of the country where I live. One more general question: I should like to ask you whether you regard money of the precious metals as a friend or as an enemy of mankind?—I do not think I am severe moralist enough to regard it as an enemy.

Right Hon. Lord Farrer.
14 Dec. 1894.

39,001. And yet, as I understand, you think it is wise that the mints of the great nations should be closed in the face of one of the two of them and its free use denied?—Yes, I think the simplicity and the excellence of a single standard is the most important consideration here.

Advantage of a single standard.

39,002. Even greater than the quantity of money?—My opinion might be different if I saw any reason to suppose that gold was becoming scarcer in proportion to the demand; I might think differently; I might think it desirable to change to silver; but I see neither practicability nor desirability in attempting to put the two together.

39,003. Surely what law has divorced law could re-marry?—I do not think that follows.

39,004. You thought it could when you sat on the Gold and Silver Commission and drew up your Report?—With qualifications.

Demand for gold and its effect on prices.

39,005. (*Mr. Dalton.*) How does the increased demand for gold manifest itself; I think you say that if the demand increases more than the supply of gold, prices fall; in what way can we tell whether the demand exceeds the supply?—It is extremely difficult to tell; but for immediate monetary purposes I imagine that the mode in which the City of London tells is by seeing the reserve of the banks fall, and then they raise the rate of discount in order to get it back.

39,006. Then the City of London supply would at the present time rather be in excess of the demand?—It is in excess of the demand.

39,007. But gold prices have not risen?—Gold prices have not risen.

39,008. What is the explanation of that?—The explanation of that is that the prices do not depend upon the quantity of gold in monetary use; they depend upon the value of gold as the standard of value, but they do not depend upon the quantity of gold which is in monetary use.

39,009. (*Mr. Chaplin.*) What do you mean by depending on the price of gold as the standard?—What I say is, that the value of the gold sovereign as a standard depends upon the aggregate supply of and demand for gold in the world, which is extremely difficult to test.

39,010. (*Mr. Dalton.*) You do not think that the scarcity or abundancy of gold has affected prices at all during the last 20 years?—I do not think so.

39,011. Then the demand for gold must have been exactly the same in proportion to the supply of gold throughout the whole of that period, and throughout the world?—As far as one can judge—but it is far too big a question to dogmatise about—I should say that there seems to be a tendency to be a plethora of gold, but it is a very speculative question.

39,012. If so would not gold prices rise?—Not necessarily; it would depend upon the commodities. So far as that was concerned they would have a tendency to rise.

39,013. (*Mr. Giffen.*) You admit that it has a tendency to raise prices?—Most undoubtedly.

39,014. (*Mr. Dalton.*) But there are no means, you would say, by which we can ascertain?—If I might put it in a broad way, supposing you doubled the quantity of gold in the world to-morrow the value of the sovereign as a standard would fall.

39,015. (*Mr. Giffen.*) Unless the demand increased in proportion?—Yes, certainly; that qualification is necessary.

39,016. (*Mr. Dalton.*) I understand we have no means whatever of ascertaining what the demand for gold at any time is?—It is most difficult. You will find in the Report of the Gold and Silver Commission and elsewhere an endeavour to estimate it made by many men who know more about it than I do. You will find, for instance, opinions as to what the demand of the world for hoarding is, and what the demand of the world for ornament is, but it is very much guess work.

39,017. (*Mr. Giffen.*) And the demands change with the price?—Yes.

39,018. (*Mr. Dalton.*) If we do not know what the demand is, we cannot say that the demand is not larger now than the supply, can we?—You cannot say positively.

Right Hon. Lord Farrer.
14 Dec. 1894.

39,019. One way or the other?—You cannot say positively; you can only look at the supply, and consider what you think to be likely with respect to the demand.

Supply of and demand for gold.

39,020. We cannot say that the scarcity or abundance of gold during the last 20 years has or has not affected prices generally?—No; all that you can do is to show the enormous accumulation of the stocks of gold on the one hand, and to consider how far you think there have been any counteracting demands on the other, and whether the counteracting demands have increased proportionately to the increased supply; you can do that.

39,021. On the whole, you are of opinion that they have balanced each other during the last 20 years?—So far as I can form any opinion upon the subject.

39,022. Pretty steadily throughout the whole of the period?—So far as I can judge; but I do not pretend to have any confident opinion.

39,023. Do you think if gold ceased to be the standard of value, the value of gold as a commodity would fall very much?—If you ceased to use gold for monetary purposes, you would put an end to one very large demand upon it and then its value would fall undoubtedly.

39,024. Do you think that is one of the main reasons why silver has fallen in value, or do you put it more to the production?—I put it upon both.

39,025. Could you say at all in what proportions?—No.

Effect of appreciation of gold in hoards.

39,026. I think you say that if there had been an appreciation of gold to the extent of 50 per cent. it is almost certain that large quantities of gold would be withdrawn from hoards and so forth?—I think so, judging only from *à priori* reasons. We see that now. Gold is coming back from India. We see therefore that if there is sufficient temptation it is withdrawn from hoards.

39,027. Is that because gold has gone up in value?—I cannot tell you; probably because of some reason in India which we do not understand; probably their hold upon it, their desire for it, has become less for some reason. I cannot tell you what that reason is.

39,028. Is it not rather the reason you mentioned which might lead a man to part with his watch, because they must part with it?—That may be; I think that is very possible.

39,029. Not because it has gone up in value?—That is possible, but then why do they continue to take silver?

Supply of silver and silver prices.

39,030. (*Mr. Everett.*) In regard to silver, when you were trying to represent that silver has depreciated in value very much, you spoke of there being a 100 millions of silver only in Europe to which new supplies now come; what I wonder is this, why you separate that in your reasoning from the great mass of silver that is in the eastern world. I should have thought that silver in Europe and in the East was all one thing and of one value, and that the additions of silver came not simply to the 100 millions in Europe as an island by itself, but to the whole continent of silver in the East as well as in the West?—We were trying to account for the fact that silver did not go to India as Mr. Bagehot and others expected it would. When silver first fell it was always expected that the East would have such a demand for it that it would be sure to go there, that silver prices would rise, and that the ratio would be maintained. That has not happened, and the question is, what is the reason of that.

Right Hon. Lord Farrer.
14 Dec. 1894.

39,031. As a fact what has happened is that India has only received about her normal amount of silver?—Yes, more or less.

39,032. And that prices in India have remained stable?—Yes.

39,033. Again supporting the quantitative theory of money?—I do not admit that. A very large quantity of silver has always gone to India.

39,034. And again confirming us that what has happened as between the two precious metals is not a change of value in silver, but in gold?—That is just the question which on the Gold and Silver Commission we argued through the whole of that volume without coming to any unanimous conclusion.

39,035. (*Mr. Giffen.*) Are you quite justified in saying that silver did not go to India as Mr. Bagehot expected; I think he did not specify the quantity, and my own impression is that silver did go as he expected?—I do not want to say anything in depreciation of Mr Bagehot, whom I very much admire; but the idea at first, no doubt, was that the silver difficulty would be got over by the silver going to India, and it was not got over in that way.

39,036. Are there not two stages of that question—that Bagehot was talking of the silver difficulty, which presented itself in 1876, a difficulty which 10 years later, owing to the great production of silver, became quite different to what it was?—That is quite possible. I do not wish to make any reflection upon Mr. Bagehot.

Purchasi power of silver.

39,037. (*Mr. Everett.*) I daresay you have noticed that the purchasing power of an ounce of silver, not only in the form of rupees in India, but as bar silver in London, is just about the same over commodities that it was 20 years ago—substantially the same?—I suppose it is. I suppose it has not varied very much. At least if you compare it with the index numbers of commodities.

39,038. If you measure the two precious metals by commodities, what they tell us is that silver has remained stable, and that gold has enormously appreciated?—If you put all the commodities together and average them, this is possibly the case; and shows, as I have stated before, that silver is a bad and not a good standard. If you take silver as against particular commodities, you will find that it has varied very much.

39,039. And the enormous number of fresh people requiring gold would lead you to expect a result of that kind, and the fact that all people who have made long time bargains in gold are in great trouble, is another confirmation that that is the thing which has really happened, is it not?—That is a question that we have been arguing throughout this discussion, and I do not know that I can say more about it than I have. Before concluding let me say that I believe Mr. Giffen was right in supposing that the United States report upon wages did not include agricultural wages. At any rate, I do not find them specifically mentioned.

The witness withdrew.

Adjourned.

Seventy-Second Day.

Thursday, 7th February 1895.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary*.
R. F. CRAWFORD, Esq. } *Assistant Secretaries*.
ALAN MACKINNON, Esq. }

Mr. T. H. Elliott. 7 Feb. 1895.

Mr. THOMAS HENRY ELLIOTT recalled and further examined.

Mr. T. H. Elliott. 7 Feb. 1895.

(For previous Evidence, *see* pages 100 and 140.)

39,040. (*Chairman.*) You have come here to-day to continue the evidence that you gave at an early date before the Commission, and to deal with the third division of your department, namely, the land division, comprising three branches, namely, the tithe and copyhold branch, the inclosure branch, and the survey branch?—Yes.

Duties of tithe branch of Board of Agriculture.

39,041. Will you first deal with the tithe branch?—Yes. At the present time the great bulk of the business of that branch is connected either with the re-apportionment or the redemption of the tithe rentcharges. I understand, however, that the Commission desire to have information before them as to the mode in which the commutation of tithes was effected under the Act of 1836, and I therefore put in a memorandum which gives in as concise a form as possible a history of the legislation on the subject of tithes, and describes the course of events subsequently to the commutation.

39,042. You put in a memorandum?—Yes, that is the memorandum (*handing in memorandum. See* Appendix A. XVII.).

39,043. Are there some points in connexion with the tithe to which you desire specially to call our attention?—Yes; I understand that there are two or three points of special interest as to which inquiries have been made by the Commissioners; and, firstly, as to the power given under section 38 of the Act of 1836 to increase or diminish the sum to be paid for commutation by not more than one-fifth of the average value of the tithes for the seven preceding years. The Tithe Commissioners were to report as to the mode in which this discretionary power was to be exercised, and I put in, for the information of the Commission, an extract from a report presented by the Commissioners in conformity with that provision of the Act of Parliament (*see* Appendix A. XVIII.). The report was presented to Parliament, but it does not appear that it was ever discussed. Before making it the Commissioners had had some experience of commutations by voluntary agreement, and in their report they observe that the rentcharges fixed had oscillated within moderate limits on each side, and they believed that the rules laid down would have a similar effect.

Tithe commutation.

39,044. What is the next point?—Before leaving that point I should like to say that the published returns enable a summary to be made of the results of the commutation so far as regards the greater proportion of the 2,483,000*l.* of rentcharges settled by agreement. The average amount of the tithes, or compositions in lieu of tithes, during the seven years preceding Christmas, 1835, together with the rates on the same when paid by the landowner, was ascertained to be 2,083,000*l.* Increases were allowed under section 38 of the Act, amounting in the aggregate to 69,000*l.*, 3·3 per cent., and decreases were allowed amounting to 4,000*l.* or 0·2 per cent., leaving a net increase of 65,000*l.* or 3·1 per cent., the resulting rentcharges being 2,148,000*l.* I mention those facts as showing that the effect of the section was as indicated in the Report of the Tithe Commissioners, that is, that there was no great amount of fluctuation either on one side or the other—either in the direction of increases or of decreases.

39,045. Is there much business being conducted now in the way of commutation of tithes?—The commutation of tithes is practically complete. There may be a few still open. I should not like to say that commutation is absolutely complete, but it is some years now, I think, since we had any case.

Corn rents.

39,046. (*Mr. Little.*) Occasionally cases of substituting a tithe rentcharge for a corn rent come before you?—Yes.

39,047. And those are still open; in any case of a corn rent existing at the present time an application may be made to the Board to convert that into a commuted charge?—Yes; and we almost every year receive applications of that kind; the substitution of tithe rentcharge for corn rents is certainly not complete.

Duties of tithe branch.

39,048. (*Chairman.*) Then at the present moment the duties of the Board of Agriculture as regards tithe are the re-apportionment of the rentcharge on lands which are subdivided from time to time, and the redemption of the rentcharge?—That is so; that constitutes the great bulk of our tithe business.

39,049. Is there much business in your department on those two points?—Yes; we publish annually a report showing the amount of business. It occupies the services of several clerks, both operations being of a somewhat intricate and laborious character.

39,050. What number of transactions have you in the course of the year?—In 1893 we received 204 applications for alterations of apportionment, and we received 488 applications for redemptions; we received 23 applications for the redemption of corn rents. I see that in 1893 we received no application for the conversion of corn rents into tithe rentcharges, but two cases which stood over from the previous year were completed in that year. We received eight applications for redemption of rentcharge under the Extraordinary Tithe Redemption Act of 1886, and there were two or three miscellaneous applications which are set out in our report.

Redemption of tithe rentcharge.

39,051. As to the cases of redemption of the rentcharge, did you mention the number?—Yes; we received 488 applications during the year and completed 342 cases; there were 1,002 cases still in progress at the end of the year 1893.

39,052. There are certain cases in which tithe redemption is obligatory?—There are certain cases, as I shall afterwards mention in my evidence, in which it is competent for the Board of Agriculture to issue an order making redemption compulsory.

39,053. Will you advert now to the power given under section 38 of the Act of 1836 to reserve cases for special adjudication?—That is a point on which it has been indicated to me that the Commission would desire to receive information, and I may say that a very general rule was set out in the report to which I have already referred, but the number of cases, if any, in which the power was exercised must have been very small indeed. There is no recollection on the part of anyone in the tithe branch of ever having seen one, and although a special report was

Mr. T. H Elliott.

7 Feb. 1895.

to be made to the Home Secretary in every case, no such report can be traced.

39,054. (*Mr. Little.*) That refers to cases where the previous value of the tithe was to be set aside?—That is so.

Tithe commutation and rates.

39,055. (*Chairman.*) Then with reference to section 37 of the Act of 1836 I think you have something to say to us?—That section imposed an obligation on the Commissioners to have regard to the fact that the tithe payer had agreed to pay rates in respect of the tithes, and to make an equivalent addition in arriving at the value of the tithes, for the purpose of the commutation. It is explained in the report which I have already put in that "the purpose "of the Act was to put upon exactly the same footing "the tithe owners who have paid their own parochial "rates, and the tithe owners whose rates have been paid "for them by the tithe payers. If, therefore, in two "parishes, in both of which the tithes have been treated "as worth 600*l*., the tithe owner in one has received "600*l*. and paid his own rates, and in the other the tithe-"owner has received 400*l*., and 200*l*. have been paid for "him as rates, that 200*l*. must be added to the 400*l*. to "make up the tithe-owner's real average, and put him on "a footing with his neighbour." There never seems to have been any doubt as to what the intentions of the Act were, until comparatively recently. A similar provision to that contained in section 37 is contained in sections 40, 41, and 43, which deal respectively with hop grounds, orchards, or gardens, coppices, and other special cases. A similar procedure is adopted for income tax purposes where a tenant agrees to pay landlord's rates and taxes.

39,056. (*Mr. Little.*) Can you give us any information as to the number of cases in which this power was exercised?—There are parliamentary returns showing the rates paid by the tithe-payer on the tithe-owner's behalf in all cases in which the rentcharge was settled by agreement, but not in cases in which the rentcharge was settled by award.

39,057. Where they were settled by agreement were not the cases very numerous where rates had been borne by the tithe-payer previously, and a sum had to be added?—Yes; it seems to have been a very general practice for the tithe-payer to pay the rates in the place of the tithe-owner. Many of the compositions between tithe-owner and tithe-payer appear to have been settled on that basis—that the tithe-payer should pay the local rates in respect of the tithes.

39,058. Would it be right, do you think, to say that the large majority of the cases were those where rates had been paid by the tithe-payer?—I think a very large proportion undoubtedly fall within that category.

39,059. (*Mr. Dalton.*) Did they take an average of the rates for a certain number of years, or did they take the rates for the last year generally?—I think they took an average of the rates for seven years, just the same as for the tithe.

39,060. (*Mr. Everett.*) The seven years prior to the 1835 rent?—Yes.

39,061. Which included the period of the greatest distress in industries of this country, when rates were at their very highest; I should think at their maximum?—Yes, that is so.

39,062. (*Mr. Little.*) But these returns which you refer to, which were continued over a great number of years, only relate, I understand, to those cases that were settled by agreement?—Yes, that is so; there are no such details given in the rentcharges——

39,063. Those cases really cover about 60 per cent. of the whole value?—Yes, that is so.

39,064. £2,483,000, and that would be about 60 per cent. of the value?—Yes, about that; I think about 7,000 out of 12,000 cases.

39,065. Something like 50 per cent. of the whole number probably came under this heading, in cases where a sum was added to tithes in respect of rates?—Probably more than that, because in the cases of awards the same circumstances would probably have been taken into account.

39,066. (*Mr. Dalton.*) Then that arrangement has operated very injuriously to the tithe-payer, has it not?—No, I should say not. The object of the Act was to stereotype the condition of things existing in the seven years prior to the commutation.

39,067. Yes, but in those years the rates were very exceptionally high—very much higher than they ever have been since?—That goes to show that the tithes were proportionately more valuable, because, in addition to the compositions paid by the tithe-payer, the tithe-payer paid a heavy rate. If the rates had not been so heavy the compositions would have been larger.

Mr. T. H. Elliott.

7 Feb. 1895.

39,068. Those were in the minority of cases in which he got the amount of his rentcharge and paid the rates himself?—Of course where he paid the rates himself no addition was made in respect of the rates paid by the tithe-payer.

39,069. Yes, but in the other case surely the tithe-payer must have been injured?—No, I think not.

39,070. He got a larger amount of tithe rentcharge awarded against him, and a considerable proportion of that was in respect of the heavy rates he had been paying for the last seven years?—No, I think not, because the heavier the rate paid by the tithe-payer the smaller the composition received by the tithe-owner. If I may say so, that is always the case, where the tithe-payer assumes a heavy burden on the landlord's behalf; the balance of course is so much less; the tithe-payer was willing to pay so much less to the tithe-owner.

39,071. (*Chairman.*) Could you give the Commission any illustration of the case where the commuted tithe has been increased in consequence of the high rates at the time, and where the tithe-owner consequently has benefited of late years by the great reduction in the rates?—I do not think that the tithe-owner can be said to have benefited except in so far as the bargain of 1836 was a good bargain. The effect of the arrangement of 1836 was to stereotype the condition of things existing in the seven previous years. The question of rates had really nothing whatever to do with the amount settled at the commutation.

39,072. I understood from you that the tithe rentcharge was increased in consequence of the heavy rates which the tithe-owner had paid previously; or, of the heavy rates which were paid in the parish previously?—Where the tithe-payer, in addition to paying a composition, had agreed also to pay a heavy burthen for rates, then, under the settlement of 1836, which I am not defending at the present moment, it is quite clear that the composition was settled, and properly so, at the same amount as it would have been if the tithe-owner had received the gross amount of the tithes, and, out of that gross amount, had paid the rates himself.

39,073. But if at that time the rates averaged 5*s*. or 6*s*. in the £, which they did, I suppose, in certain cases at that time, and the rates have since been reduced to an average, say, of 2*s*., which is the average now in rural districts, the tithe-owner practically has gained largely, has he not?—I would rather put it in this way: that the tithe-owner undoubtedly benefited by the reduction of the rates, as any other owner of property would benefit by the reduction of the rates; but it is a fallacy to suppose that the rates were added to the compositions in order to enable the tithe-owner to pay the rates. They were not added to the compositions in order to enable the tithe-owner to pay the rates; they were added to the compositions in order to get at the value of his property for the seven years previous to the commutation.

39,074. (*Mr. Everett.*) So that the commutation sum was really made less where the rates were very heavy?—No, neither less nor more; the object was to get at the gross amount which the tithe payer would have paid to the tithe owner, assuming that the tithe-owner bore the burthens proper to the ownership of the tithes.

39,075. (*Mr. Dalton.*) But when these arrangements were made to receive so much less tithe in consequence of the rates, I suppose it was not, in all cases, foreseen, that the rates in those particular years would be as heavy as they were, for they rose very rapidly in those years. I suppose also that these were not yearly agreements, and that some of the agreements had been made some years before, when the rates were lower. But in those particular years the rates were very heavy, and so the man who had agreed to pay the rates had lost; but if you added the two together would you not give the tithe-owner an advantage in the commutation?—Then, I think, it would have been open to the tithe-payer to claim a decrease on the ground that the compositions did not fairly represent the condition of things during that year.

39,076. (*Captain Owen Thomas.*) Mr. Farquharson in the evidence he gave before this Commission, at Question 31,997, said: "I could instance a parish in Hampshire, "the parish of Tadley; in that parish they actually "added 19*s*. in the £ for rates, making the par value at "the time nearly double what it ought to have been"?—I am aware of Mr. Farquharson's views, but I do not agree

Mr. T. H. Elliott. 7 Feb. 1895.

with them. I do not think Mr. Farquharson appreciates the position. If the tithe-payer was willing to pay 19*s.* by way of rates, and also a composition, it is quite clear that the value of the tithe to the tithe-owner was the two together.

39,077. But he names the parish here, and he says, in a latter part of that same answer, that the rates are now only 1*s.* 3*d.* in the £?—No doubt, as I have already said, the owner of the tithe rentcharge has benefited by the reduction of the rates, just as any other owner of property has benefited by the reduction of the rates, but the fact that an owner of property benefits by the reduction of rates, does not, necessarily, call for an alteration of the value of that property. I may buy property and I may find by a fortunate sequence of events that the rates decrease, but it by no means follows that I ought to pay to the seller an addition to the price I paid for the property.

39,078. (*Mr. Little.*) I understand your argument to be that if in one case a man paid 100*l.* in tithes, and 25*l.* in rates, the sum was commuted at 125*l.*?—That is so.

39,079. If, on the other hand, the tithe-payer paid 125*l.* in tithe, and the tithe-owner bore the 25*l.* in rates, the 125*l.* would be given in the same way?—That is so.

39,080. Then those would stand upon the same footing, and in both cases if the 25*l.* was reduced to 5*l.*, it would have the same effect?—That is so, and that was the intention of the Act, is clearly indicated by the quotation from the report made soon after the passing of the Act which I have read to the Commission.

39,081. (*Mr. Dalton.*) I think you say that if parties had realised that the rates in those seven years were exceptionally light, they could have claimed a decrease in the commutation, but they, at that time, could not foresee what was coming afterwards, and were possibly not aware then that those were going to be very exceptional years?—There was never any question of what was to come after the commutation. I understood the Commissioner's proposition was that where a composition had been effected, and the rates had fallen or the rates had risen during the seven years previous to the commutation, then the composition would have been unduly favourable or the reverse to the tithe-owner, and I said that in that case it would have been open to the tithe-payer to claim a decrease, or to the tithe-owner to claim an increase. The object, however, of the commutation was not in any way to anticipate the future, but simply to give expression to the past, that is, to the condition of things in the seven years prior to the commutation. The only respect in which future events were anticipated, was in regard to the fluctuations in the value of currency.

39,082. (*Mr. Little.*) The tithe-payer has gained, like other people, by the reduction of rates?—To the extent that the rates fall upon a tithe payer.

39,083. He then has a benefit which the landowner has not, in that his rates fall with his income, and the landlord's and tenant's rates, bear a ratio, not only to the income of one but to the income of both?—Yes, but I should hesitate to express an opinion as to which has benefited most by the changes in the amount of rates—the landlord or the tenant.

Method of the commutation of 1836.

39,084. (*Chairman.*) Can you give the Commission any idea as to the data upon which the commutation of 1836 was made, so as to afford us the opportunity of forming an opinion whether any recommutation would be possible?—Yes, I thought it might be of advantage to the Commissioners if I were to present to them a summary of the information in our possession as to the facts before the Tithe Commissioners in 1836 in certain typical parishes which were selected very much at haphazard. I shall be glad to put in that memorandum (*handing in the same,* see Appendix A. XIX.) I think the Commissioners will gather from that memorandum, that any attempt to recommute the tithes on the basis of what was the condition of things in the seven years prior to 1836, would be a practical impossibility. It would be impossible to say now, assuming that the tithes had continued to be paid in kind, what amount of tithes would be payable in any parish during the seven years prior to 1895. I thought it would be useful if, in that summary, I gave an analysis showing the different rates per acre at which the different descriptions of land in those parishes, were charged. The first parish is that of High Laver, Essex. There I find that the arable land was charged on the average at 6*s.* 2*d.* per acre; the pasture at 4*s.* 10½*d.*; the wood at 1*s.* 5½*d.*; and the miscellaneous lands at 6*s.* 7*d.* per acre. Then in the parish of Abbotts Roothing, Essex, the arable land was charged on the average at 6*s.* 3½*d.*; the pasture at 4*s.* 8½*d.*; the wood at 1*s.* 3*d.* and the miscellaneous lands at 4*s.* 11*d.* per acre.

The parish of Grainthorpe, Lincoln, is the next, and there the arable land was charged with 8*s.*, and the pasture with 3*s.* 0½*d.* per acre. The parish of Hedon, in the East Riding, is the next; the arable land was charged with 15*s.* 3½*d.*; the pasture with 2*s.* 10½*d.* and the miscellaneous land with 12*s.* 10½*d.* per acre. The parish of Newchurch, Radnor, is the next; the arable land was charged with 3*s.* 4½*d.*, and the pasture with 2*s.* 0⅝*d.* per acre. The parish of Ashford Devon, is the next; the arable land was charged with 5*s.* 6½*d.*, the pasture with 3*s.* 6½*d.*; and the miscellaneous land with 6*s.* 4*d.* per acre. The township of Houghton-le-Spring, Durham, is the next; the arable land was charged with 5*s.* 2*d.*, the pasture with 4*s.* 7*d.*, and the miscellaneous with 6*s.* 4*d.* per acre. The township of Aintree, Lancashire, is the next; the arable land was charged with 3*s.* 9½*d.*, the pasture with 3*s.* 3⅝*d.*, and the miscellaneous land with 4*s.* 0½*d.* per acre. The parish of Appleshaw, Hants, is the next; the arable land was charged with 5*s.* 10½*d.*, the pasture with 7*s.* 8½*d.*, the wood with 1*s.* 1½*d.*, and the miscellaneous land with 7*s.* 5½*d.* per acre. Finally, an analysis of the apportionment for the township of Nuthurst, in Warwickshire, shows that the arable land of the parish was charged on the average with 4*s.* 8½*d.*, the pasture with 3*s.* 0½*d.*, the wood with 10*d.*, and the miscellaneous land with 7*s.* 4*d.* per acre. Those figures, of course, show what considerable fluctuations there are as between parishes and as between different descriptions of land in the same parish.

Mr. T. H Elliott. 7 Feb. 1895.

39,085. Will you refer back to Essex for a moment and say again the difference in the commutation for arable land and pasture land?—The two Essex parishes I have are High Laver and Abbotts Roothing. In High Laver the arable land was charged at the rate of 6*s.* 2*d.* per acre, and the pasture at 4*s.* 10½*d.*; and in Abbotts Roothing the arable land was charged at 6*s.* 3½*d.* and the pasture land at 4*s.* 8½*d.* per acre.

39,086. Then the commutation in Essex was extremely high?—The commutation was high, because on the septennial average the tithe taken in kind was high.

39,087. But in fact it was high, especially on the arable land?—Yes, although there are higher figures in some of the parishes I have read out than those I have given for these two Essex parishes.

39,088. Supposing in the late years the arable land has fallen back into wretched grass which is not worth more than a shilling or two shillings an acre, it still continues to pay the high commutation, on the supposition that it is arable?—Yes; that was one of the effects of stereotyping the payments in the seven years prior to the commutation.

39,089. That commutation will go on for ever, will it not?—Until the tithe is redeemed.

39,090. And that according to your proof might take many thousands of years to come into effect; and it would be apparently about 6,000 years hence; in the meantime this land which was commuted at this high rate would continue to pay a high tithe notwithstanding that it has ceased to have any value, or has very little value?—Yes; I propose to refer later to the provisions of the Act of 1891 as regards relief.

39,091. But that is the present position; apart from any remedy given under the Act of 1891 that would be so?—Yes, that would be so.

39,092. (*Mr. Little.*) Do I understand that the Tithe Office is in possession of information with regard to all awards that were made or agreements that were made similar to that which you have extracted here?—Yes, practically that is so. I would not say that out of these 12,000 or 13,000 cases there are not a few missing, but practically the papers show some information in the case of every parish as to the manner in which the agreements and awards were arrived at.

39,093. They are confidential documents which are not open to the public, I suppose?—They are not open for public inspection; but I do not regard them as possessing any more confidential character than any other ordinary file of papers in a Government office.

39,094. (*Chairman.*) You were referring just now to the case of Essex, where you have shown that the high commutation has fixed a permanent charge upon land, which at that time was of very considerable value, but which now, in consequence of the changes in agriculture and so forth, has ceased to have in many cases any value at all, or would at all events be reduced to a very small value; will you now proceed to point out what was the remedy under the Act of 1891 which was intended to meet exceptional cases of that kind and how far it has operated?—Yes. I gather from what was said in the House of Commons when the Bill was introduced that the principle upon which

Mr. T. H. Elliott.
7 Feb. 1895.

section 8 of the Tithe Act of 1891 was framed was that the tithe-owner should not be entitled to recover from the tithe-payer a sum in excess of that which he might expect to obtain if he were to take possession of the land subject to the tithe rentcharge; and with a view to arrive at an estimate of that sum two-thirds of the amount at which the land was assessed to income tax under Schedule B. was taken.

39,095. Then the Act provided that the tithe-owner should not, in fact, recover more than two-thirds of the value of the rent?—Not quite that.

39,096. Not of the rent but of the value of the income?—It provided that the tithe-owner should not be entitled to recover more than two-thirds of the gross value of the land, or in other words, the net value of the land. He was not to recover more than the net annual value of the land to the landowner.

Tithe Act of 1891.

39,097. Of course, one effect of the Act of 1891 was to throw the payment of the tithe upon the landowner?—The primary purpose, you may say, of the Act of 1891 was that the landowner should pay the tithe.

39,098. The Act contained a provision, did it not, to give relief, in very exceptional cases, where the tithe had assumed a larger proportion to the rent, or rather, where the rent had assumed a very low proportion to the tithe rentcharge?—Yes, where the tithe rentcharge was really in excess of the net annual value of the land to the landowner.

39,099. Have you any information as to any cases which have occurred under that Act?—I should say that we have received many complaints by tithe-payers as to the inoperative character of the relief section of the Tithe Act of 1891. The Board thought it desirable, in the course of 1893, to make some inquiries as to the operation of that section through some of their inspectors. I would ask the Commissioners not to ask me to give the names of the inspectors; there would be some disadvantage in that, as they are not Government officers; but it may be useful that I should read extracts from their reports on this subject. One inspector says: "In no single instance have we, as tithe-"owners, been compelled to make any remission under "the section of the Act above referred to. In one isolated "case where a large farm had previously actually been "seized for non-payment of tithe rentcharge, the applica-"tion was made, but the assessment was subsequently "discovered to be adverse, and the case fell through."

39,100. Without naming the inspector, can you say what part of the country that was in?—I think I would simply say the southern midlands.

39,101. Was it not a district where the rent had fallen to a point a little more than the tithe, or about the same as the tithe?—Yes. I think further extracts from his letter will show that very clearly: "There is, in my "opinion, no doubt but that there are many cases in "which claims might be substantiated, which fail technically "because the income tax assessment has, through neglect "or carelessness, not been put upon a proper basis. "Ignorance of the possibility of obtaining the remission, "and some dread, perhaps, of the trouble and possible "expense involved, and probably other reasons have re-"sulted in the clause, so far as my own experience goes, "being practically of no effect. As acting for landowners, "I have found in many cases into which I have looked, "that though very close, the tithe is often just within the "proportion which the section specifies; but I am on the "point of further investigating several cases which will "probably result in successful applications under this "section. Apart from my own experience I have, since "the receipt of your communication, inquired of several "land agents in considerable practice within a radius of "30 miles, but none seem to have had any experience of "the working of the section, and it is generally described "as a dead letter. Personally I am of opinion that this "portion of the Act might be much more widely taken "advantage of than it is, but there seems to be a certain "apathy on the part of the agricultural public which is "often enough associated with matters which, like this, "involve procedure in a new direction. More care in the "matter of assessment for income tax would, I think, "result in more activity in applying this portion of the "Act. Possibly also sufficient time has not yet been "allowed for a fair estimate of the ultimate results which "may accrue." I should say that on the receipt of that and other reports the Board issued in the first place a leaflet giving general instructions to farmers as to their rights in the matter of income tax assessments; and having, as they hoped, directed attention to the fact that the adjustment of the income assessments was in the first place necessary, the Board then issued a leaflet acquainting landowners and occupiers with the relief to which they were entitled under the Tithe Act of 1891.

Mr. T. H. Elliott.
7 Feb. 1895.

39,102. Now, could you give me a copy of those leaflets?—Yes, those are the two leaflets (*handing in same*). Another of our inspectors said: "That cases "do exist where the Act might come into play is "much to be feared, but the not unnatural dislike on the "part of the landowner to the position being known, "the possible dread of the machinery of the county court, "and the bare possibility of an improvement in the "rent taking place before very long must deter most "from taking advantage of the section of the Act." Another inspector writes, "I have not heard of any attempt "on the part of tithe-payers to avail themselves of the "opportunity afforded by this provision of the Act of "obtaining a reduction of tithe rentcharge. In this "district, notwithstanding the disastrous circumstances "of the times, we have not yet reached the point where "the provision referred to would be applicable." That is a district in which there have been a large number of cases in which the tithes have been commuted by allotments of land, so that it was not to be expected where that has been the case that the Act would have a very wide operation. I may say generally that the reports I have read come from districts in which there was most reason to believe that the Act ought to have operation, in other words, in which the tithe rentcharge most closely approached the net annual value of the land.

39,103. I gather from those letters that two difficulties have been experienced by the tithe-payer; one is, that the income tax valuation is conclusive as to the value of the land under the Act, and if therefore, there has been an excessive valuation for income tax, it practically deprives the tithe payer, for the moment, of a remedy in respect of that particular year for which the application is made?—Yes.

39,104. And the other is, that it is necessary, in order to get a remedy under the Act, that proceedings should be taken in each year before the county court in respect to each payment of tithe?—Yes, that is so.

39,105. Therefore the proceedings involve legal expenses in respect of each claim that the tithe-payer may have to make against the owner for relief under the Act?—I do not think it can be said that it is necessary that, in order to obtain this relief, the tithe-payer should go into the county court; I cannot think that the tithe-owner, if the case were at all clear, would force a tithe-payer into the county court, except in exceptional cases, in order to establish his claim to relief. The reasons which appear to us to have prevented the Act of 1891 from having anything like the operation which we think it ought to have, are, firstly, the high standard adopted by taking the assessment to income tax, Schedule B, and, secondly, the high proportion, two-thirds, taken to arrive at the net annual value of the land.

39,106. Then they are very exceptional occasions on which any relief at all is given?—They must be exceptional cases.

39,107. And the relief then would be very small?—Yes, increasing in proportion to the exceptional character of the case. It would have to be a very exceptional case in which very substantial relief was given.

39,108. Supposing the rent of land paid by the farmer had fallen to the value of the tithe, then he would be relieved to the extent of one-third?—Yes.

39,109. But supposing there is still a little beyond the tithe, say a few pounds, that would reduce the proportion, and leave a very small residue to represent the relief given by the Act to the tithe-payer?—That is so. It would not be in many cases that any substantial amount of relief would be given on the principle underlying the Act; but we think that admitting the principle underlying the Act, events have shown that it was not applied with sufficient liberality to the tithe-payer.

39,110. (*Mr. Everett.*) I think you hardly answered the Chairman's question in accordance with what you had yourself stated previously; you had stated previously that, the more exceptional the case, that is, the larger the proportion tithe bore to the joint sum, when the tithe was added to the rent, the less was the relief?—I cannot have expressed myself quite correctly. What I meant to say was, that it is only in exceptional cases that any relief can be obtained; but they must be very exceptional cases indeed in which any substantial amount of relief is obtained.

39,111. (*Mr. Dalton.*) But you think the object was that the tithe should not exceed the net income from the land?—The net value of the land to the landowner.

39,112. But that it ought to be paid, whether the landowner got the rent or not; the landowner would have to

Mr. T. H. Elliott.
7 Feb. 1895.

pay the tithe whether he recovered his rent or not?—That is so. No account was taken of irrecoverable rent, or of voluntary remissions of rent.

39,113. (*Chairman.*) Let us endeavour to illustrate it by putting a supposed case. Supposing the tithe rentcharge on a particular farm is 60*l.* a year, and the rent is reduced to 60*l.*, that is to say, is no more than the tithe, then that tithe-payer would be entitled to recover 20*l.*, or rather, to have the reduction of his payment made to the extent of 20*l.*, that being one-third of the 60*l.*?—In the case that you are assuming, would there be in fact the two rents; would the occupier pay 60*l.* to the landlord and 60*l.* to the tithe owner? If he did, in that case the assessment under Schedule B. would be 120*l.*

39,114. I am not putting that case, because the tithe is paid now by the landlord, therefore the rent of the land includes the tithe, and therefore, if the true rent of the land is 60*l.*, and the tithe is 60*l.*, the owner would get nothing apart from the remedy of the Act, and the whole of it would go to the tithe-owner—that would be so, would it not?—In that case it would be so.

39,115. In that case, which is an extreme one, the tithe-payer, by proceeding under the Act, would be entitled to have his tithe payment reduced to 40*l.*, that is, to two-thirds of the 60*l.*, and therefore he would gain 20*l.*?—That is the case assuming that the Schedule B. assessment was 60*l.* only. I should like to say, however, that there still remain a large number of cases in which the occupier pays the tithe rentcharge, or an equivalent of the tithe rentcharge.

39,116. I am now putting the ordinary case, and the ordinary case is that in which the owner pays the tithe rentcharge. That is the case supposed by the Act of 1891, because the Act of 1891 imposes upon the owner the obligation of paying the tithe, and the ordinary case now is that the rent includes the tithe, the owner paying the tithe?—We have no very distinct information as to how far the Act of 1891 has come into operation in that direction yet. Undoubtedly there are many more cases in which the occupier still pays the tithe rentcharge, or an equivalent to the tithe rentcharge, than might be imagined.

39,117. But still, the ordinary case now must be that the landlord pays the tithe; is that not so?—That is the normal condition contemplated by the Act.

39,118. And therefore I am taking an illustration from the normal condition?—As contemplated by the Act.

39,119. (*Viscount Cobham.*) Where the occupier pays the tithes, I suppose the Act of 1891 is hardly applicable?—The cases where the occupier pays the tithe ought to be a gradually diminishing number.

39,120. In those cases, at present, provided that the landowner gets any rent at all, this section would not apply?—No; because in arriving at the amount to be assessed under Schedule B., the rent paid to the landlord and the tithe rentcharge paid to the tithe-owner would be added together.

39,121. (*Chairman.*) I put an extreme case, where the tithepayer would get something, namely, where the tithe swallows up the whole rent in fact. Now supposing instead of the rent being 60*l.*, the rent is 90*l.*, the tithe being still 60*l.*——?—Would you say, to prevent any ambiguity on my part, not where the rent is so much, but where the land assessed under Schedule B. is so much? The difference is important.

39,122. Is the difference important?—I think so.

39,123. (*Mr. Everett.*) And Schedule B. should be the same as the rent where the landlord pays the tithe, should it not,—to get at Schedule B. you only add the tithe in cases where the tithe is paid in addition to the rent?—Yes; that is where there are two assements under Schedule A., where there is a value in addition to the value assessed on the landlord.

39,124. (*Chairman.*) The difference that you refer to is rather against the tithe payer, because it reduces the scale by which the reduction is made?—Quite so.

39,125. Supposing in this case that I have mentioned the rent is 90*l.* a year—that is, that 90*l.* a year is paid by the tenant, and the owner out of that has to pay 60*l.* a year in the shape of tithe, then he would go to the Income Tax Office, and he would find that the valuation of his land, instead of being 90*l.*, is probably only 70*l.*?—I do not believe that such a case as that exists.

39,126. What is the reduction made by the Income Tax Commissioners, to which you have adverted, when taking the valuation as compared with the rent?—The full annual value of the land is charged at a reduced rate; but the assessment in Schedule B. is the full annual value of the land, whether that annual value is paid in one sum to the landowner or in two sums, namely, one sum to the landowner, and one sum to the tithe owner.

Mr. T. H. Elliott.
7 Feb. 1895.

39,127. I have assumed the case in which the landlord pays the tithe, and of course there would be only one calculation there?—That is so.

39,128. Now I have assumed that the rent which the tenant pays to the landowner is 90*l.* a year, and that the tithe is 60*l.*?—And that the assessment under Schedule B. is 90*l.*?

39,129. Yes. In that case the tithe-payer would get nothing?—The tithe-payer would have to pay the 60*l.*

39,130. He would have to pay his full 60*l.*?—Yes.

39,131. And therefore he would get no relief at all?—No relief at all.

39,132. Then between those two limits, assuming the tithe is in all those cases 60*l.*, there would be a gradual fining off of cases in which the tithe-payer might get relief in the extreme case of 20*l.*, and at the lowest nothing?—Yes.

39,133. Then in order to get that small margin, which in some cases must be a very small one, because they must be very exceptional cases in which the rent is reduced under the actual tithe?—In some districts I am afraid that they are not so exceptional.

39,134. But still compared with the great bulk of cases it would be so?—Yes.

39,135. There are a great many cases where the rent is a few pounds above the tithe?—Yes, undoubtedly there are cases of that kind.

39,136. In those cases the relief would be extremely small?—Extremely small in those cases.

39,137. In order to get that relief the tithe-payer has got to go into the county court?—I think not.

39,138. Not necessarily?—Not necessarily.

39,139. Not unless he cannot come to an agreement with the tithe-owner?—If there is any dispute.

39,140. Have you not heard it stated as a fact that the tithe-owners, as a rule, decline to come to any arrangement, and that in order to get any relief at all the tithe-payer is compelled to go into the county court?—No, I have not heard that.

39,141. But still your evidence is that in point of fact the tithe-payer has not succeeded in many cases that you are aware of in getting any relief?—That is so. Undoubtedly the Act has not had that same operation which it was expected to have, and which in our opinion it ought to have.

39,142. Has it in your knowledge had any effect? Do you know of any cases where it has had effect?—Yes, there have undoubtedly been cases.

39,143. (*Viscount Cobham.*) Some may prefer voluntary arrangements?—I am myself disposed to think that the tithe-owner does not foolishly contest a claim and take it into the county court if the necessity for the relief is clear.

39,144. (*Mr. Dalton.*) Is the tithe-owner put to expense in going to the county court? He need not attend now, need he? Must not all the expense be incurred by the other side?—I suppose the county court judge might require the tithe-payer to state his case.

39,145. But he need not appear, need he?—I would simply say this, that I do not think the county court is the best tribunal for the matter, but I think it would be going too far to say that the tithe-owner resorts to the county court under any and every circumstance. I do not believe that he is so foolish as to do so.

39,146. But the initiative must rest with the man who wants to get relief?—The initiative of course must rest with him.

Assessment to income tax.

39,147. (*Mr. Little.*) On the point of assessment to income tax I should like to ask whether that assessment is not a difficulty in the way of obtaining relief; the assessment remains the same whether the rent collected is more or less, does it not?—Yes.

39,148. For instance, if 50 per cent. is given by the landlord off the rent the tenant may claim an abatement of the income tax on that account, but the assessment remains the same?—Yes; and I would say that in our opinion such reductions as that, assuming that their *bona fides* are clearly established, ought to be taken into account in arriving at the net annual value of the land to the landlord.

Mr. T. H. Elliott.
7 Feb. 1895.

39,149. The object being to ascertain the actual value of the land, the means taken to ascertain that value are hardly fair, because the assessment remains at a point which it is impossible to reach?—Yes, that is so, undoubtedly, in cases in which the assessment remains unaltered, and voluntary and *bonâ fide* remissions of rent are made.

39,150. Besides which there are a great number of assessments where the tenant has no interest whatever in seeing that it is kept down, as he pays no income tax?—If he is exempt of course he has no interest in keeping down the assessment.

39,151. Therefore in many cases the assessment might be considerably above the actual value?—I would say as to that, generally, that in our opinion two-thirds of the Schedule B. assessments is too high a figure, and that in a large number of cases it is in excess of the net annual value of the land to the landlord. We think that in fixing the proportion of two-thirds you ought to take into account the fact that you are taking a very high standard of valuation.

39,152. (*Mr. Dalton.*) Do these assessments get frequently altered?—I believe they do get frequently altered, but not so frequently as they ought to be altered if occupiers were alive to their own interests.

39,153. There is no systematic alteration of them?—Of course the alteration depends upon the initiative of the occupier.

Tithe Act of 1891.

39,154. (*Mr. Little.*) There is another point which now we are on this particular subject I might ask. Where an owner has several closes of land in a parish the tithe-owner has a remedy against all those closes for the tithe on any one where there is an apportioned tithe, has he not?—Yes, unless, of course, the tithe is separately apportioned to each.

39,155. Even where it is separately apportioned to each has not a tithe-owner this remedy, that supposing one piece of land does not yield the tithe another piece of land may?—Yes, I think that is so.

39,156. So that a landlord in appealing under this Act would have to bring into account before the county court judge all the tithes for which he is liable in the parish on lands in his own occupation, or in the occupation of the same person who occupies the land in question?—No, I think not.

39,157. Allow me to refer you to subsection 6 of section 8 of the Act of 1891: "Where it appears from any "award that a special apportionment has been made, in "pursuance of section 58 of the Tithe Act, 1836, whereby "tithe rentcharge has been charged specially upon certain "closes of land in different proportions and to the exclusion of certain of them, the court shall not grant a "remission under this section unless satisfied that the "applicant would have been entitled to such remission "if no such special apportionment had been made." That is the only exception to the case of the liability of the owner in respect of the whole of his land, is it not?—Yes; but I think the object of that was to prevent a positively unfair claim for relief on the part of the tithe-payer in a case where, for the convenience of the landowner, certain lands were not charged with tithe at all and other lands charged with a heavy tithe.

39,158. But that is the only clause in this Act which refers to case of field apportionment?—I think not.

39,159. Then the old law as to the liability of other pieces of land for the tithes upon one piece would remain. Under the Act of 1836 the tithe-owner could go upon any of the land of the owner's in his own occupation, or upon any lands belonging to the owner in the occupation of the same individual?—We have not heard any complaints of the operation of the Act in that respect. I think the object of the Act is quite clear, that a comparison is to be made between the tithe rentcharge and the Schedule B. assessment on the lands in respect of which it is payable, and if necessary, a separate valuation for the purposes of Schedule B. is to be made in order that that comparison may proceed. There is one point I should like to mention in connexion with the Act of 1891, and that is, that we have some reason to think that, owing to the manner in which the income tax, Schedule B., assessments are made the clause of the Tithe Act of 1891 is not so operative as it ought to be. We are now in communication with the Board of Inland Revenue as to whether it is legally correct for the Commissioners of Income Tax, in order to arrive at an assessment to Schedule B., to add the tithe to the Schedule A. assessment in respect of the rent, where there is a separate assessment on the tithe-owner, instead of making a separate valuation for assessment under Schedule B. Our view is that under the arrangement which seems to be in force the tithe rentcharge becomes, in some sense, a measure of itself; that you cannot get relief from the tithe rentcharge until you get Schedule B. assessment altered, and that you cannot get the Schedule B. assessment altered, because the tithe rentcharge is what it is. I only wish to say that the Board of Agriculture are in communication with the Board of Inland Revenue on the subject, with a view to see that convenience of practice should not over-ride the rights of tithe-payers.

Mr. T. H. Elliott.
7 Feb. 1895.

39,160. (*Chairman.*) Then the opinion of your department is, that instead of the proportion being two-thirds it should be something less?—What we think is, that the remission of tithe rentcharge might be very well allowed down to one-half of the assessment under Schedule B., having regard to the very high standard which Schedule B. may be said to represent. We also think that remissions of rent in respect of which income tax, Schedule B., is repaid, should be taken into account, subject to certain rights of appeal, even although the assessment remains unaltered.

39,161. (*Mr. Dalton.*) Irrecoverable rents as well as remissions?—Irrecoverable rents I would say also.

39,162. (*Viscount Cobham.*) That would reduce the tithe rentcharge to about 37 per cent. of the commuted value, would it not?—The tithe rentcharge for 1895 is about 73*l.* of the commuted value; but then we should say that the purchasing power of that 73*l.* is practically the same as the purchasing power of the 100*l.* was, and that the tithe-owner has, as a matter of fact, suffered very little, if any, reduction of the purchasing power of his rentcharge, and that the object of the fluctuation according to the price of corn, was merely to adjust the fluctuation in the standard of value—not that those fluctuations should in any way represent the increase or decrease in the value of the produce.

Septennial averages and tithe rentcharge.

39,163. (*Mr. Giffen.*) Was that quite so, according to the proceedings before the Tithe Acts?—I think so. I gather from the debates which took place prior to the commutation that the object of taking the septennial averages was simply to prevent the tithe rentcharge being worth more or less according to the fluctuations in the standard of value; much more ingenious arrangements would have had to be resorted to in order to meet the fluctuations in the value of the produce.

39,164. I speak from recollection merely, but I think that the matter was not very clearly explained, and that both ideas were somewhat mixed up in some way or other in the minds of those who promoted the tithe settlement?—I should scarcely agree with that. I think the tithe settlement of 1836 was based mainly upon the corn rents which had been previously in existence in a very large number of parishes; and it is quite clear that the corn rent was an invention directed to the removal of fluctuations in the value of the standard. There is an interesting statement in Blackstone to that effect, describing the views which Lord Burleigh and Sir Thomas Smith, who invented corn rents, had in their minds.

39,165. I am speaking just now of what actually took place in the Debates on the Tithe Settlement of 1836?—I have before me extracts from the speeches made by the responsible ministers at that time, and my impression distinctly is in reading those, that the object in view was merely to meet alterations in the value of money.

39,166. But it was also to be quite fair to the tithe-payer as well as to the tithe-receiver, was it not?—I cannot think that alterations in the value of the produce had anything to do with the arrangement made, because otherwise it was quite obvious that they were absolutely insufficient, and that they did not in any way meet the possible changes in cultivation which might reasonably have been expected.

39,167. It may be quite obvious, but was it not the case that people at that time had the idea that this was quite sufficient to meet the equity of the case of the tithe-payer?—I do not think so. I think the idea simply was to stereotype the tithes collected in the seven years prior to the commutation, and then to make such arrangements as would meet fluctuations in the standard. Lord Althorp in 1834, who was then Chancellor of the Exchequer, in moving a resolution on the question of Tithe Commutation, said that "fixing the payment upon the "principle of a corn rent is, in fact, making it an unvarying payment; that principle being applicable only to an "alteration in the value of money and not to an alteration "in the value of the land itself."

Mr. T. H. Elliott.

7 Feb. 1895.

39,168. Was it not the case—I am speaking from recollection, but I think it is important to have this upon the notes—that, when Joseph Hume, I think it was, suggested that in view of the repeal of the Corn Laws, the prices of produce might go down very much, and asked would the tithe-payer in that case be in a proper position, the answer was that by adjusting it according to the value of the produce that would be sufficiently provided for; and remarks of that kind were made in the course of the debate, but, perhaps you are not able to go into that question?—I can only say that I have carefully examined the debates, and that I do not arrive at that conclusion. As a matter of fact, the rentcharge was not fixed by reference to the diminishing value of the produce, but only in respect of the alterations in the value of three particular cereals. There were many other subjects of agricultural production at that time, and if the idea had been that it should fluctuate according to the price of the produce, other things would have had to be taken into account.

39,169. It is very natural to think so now, but was it not stated in the course of the debates, as a matter of fact, that this was providing for the fluctuations in the value of the produce?—I do not think any statement of that kind was made by any Minister in charge of the Bill; on the other hand many statements were made by Ministers in charge of the various Bills which were brought into Parliament between 1830 and 1836, which indicate that the whole object of the septennial average was to meet fluctuations in the standard of value, and as a matter of fact, the fluctuations of the prices of the three cereals have very closely followed the fluctuations in the prices of commodities taken as a whole. I have compared the figures given by Mr. Giffen in the memorandum which he has put before the Commission, as to the "Economist" and Sauerbeck's Index Numbers, with the similar figures in the case of the tithe rentcharges. I find that the tithe rentcharges have fallen in almost the same proportion—a little greater but not very much—as those Index Numbers.

39,170. (*Viscount Cobham.*) That would not apply to many things that the clergyman has to purchase, would it—labour, for instance?—I believe labour is not taken into account in these index numbers. That is rather a moot point.

39,171. (*Mr. Giffen.*) That is a little away from the point that I am rather pressing just now. I should like you to consider it again, because I had occasion some three or four years ago to read all these debates very carefully, and I came to the conclusion that the element of adjusting the thing equitably for the tithe-payer by making the tithe fluctuate according to the value of the produce was considered, and that that was a material point in settling the tithe rentcharge?—I can only say that I do not share that opinion. After all, we are not in possession of very complete reports of the debates, but I have several extracts here, which I could read if it is worth while.

39,172. It is impossible to prove a negative. If you say you have no recollection of any extracts justifying my view I do not see any necessity for reading extracts justifying the other side, which I do not dispute at all. I do not dispute that that element entered into it?—I do not recall any extract from the speeches of any responsible Minister which supports the view that the fluctuations according to the septennial averages were directed to fluctuations of the produce, and not to fluctuations in the standard of money.

39,173. You do not recall such an incident as that which I have mentioned when the suggestion was made that produce was going to fall?—No. I can only say that the best tradition in the office is that the fluctuations in the tithe were directed to fluctuations in the standard of money, and not to fluctuations in the produce, and that, as far as I have been able to read from the debates, that view is very fully supported by the declarations of the responsible Ministers at the time.

39,174. That view was, no doubt, stated in the course of the debates as well as the other view which I mentioned; but what I am asking now is whether you are quite sure that no other view also entered into the subject?—I do not believe that in framing the Bill the Ministry intended to meet fluctuations in the produce, nor do I believe they made any statements in the course of the debates which clearly show the opposite.

39,175. I do not think the point was quite clear; they thought that with this settlement they provided for the two things—the fluctuation in the value of money and the special fluctuation in the produce, which the tithe-payer would have to consider, and they did not always clearly distinguish between the two ideas?—I cannot think that Sir Robert Peel failed to distinguish very exactly between any two ideas.

Mr. T. H. Elliott.

7 Feb. 1895.

Corn rents.

39,176. (*Mr. Little.*) You said that the idea of taking wheat, barley, and oats, as the measure of the value of money was based upon the adoption of corn rents very generally in inclosures?—I think there can be no doubt about that.

39,177. Those corn rents were all wheat rents only, were they not?—Yes.

39,178. Except one?—Except one; I am aware that there was one——

Prices of wheat, barley, oats, and the tithe rentcharge.

39,179. On the eve of the commutation there was one where wheat, barley, and oats, were taken in equal proportions?—Yes, and I think the reason was that in taking the price of the three, you would get a better scale upon which to determine the value of the standard, than by taking a single article alone. Many economists have considered it necessary, in order to arrive at some measure of the standard of value to take a very large number of articles. I think the "Economist's" index number is based on some 30 different articles.

39,180. (*Mr. Dalton.*) If the tithe rentcharge was determined and these three articles were selected merely with regard to the value of money, and not with regard to the value of produce, then they only looked at one side of the question, and that was the side of the man who received the tithe. They tried to take care that he should receive the same as before; but they did not make any effort to secure that the burden on the land should be the same?—I think it was thought that the benefit conferred upon the landowner by the commutation was undoubted and likely to be generally operative. I do not think that the framers of the Bill thought that the commutation would act injuriously to the landowner.

39,181. (*Mr. Giffen.*) Were they not under the impression that agriculture was going to improve steadily from that point, and that probably the tithe rentcharge would be a diminishing proportion of the total produce?—I think that is so, because the Bill was mainly directed to the abolition of the growing tithe.

39,182. And that idea has not been confirmed as far as that is concerned?—They did not look far enough ahead.

39,183. Is it possible to look far enough ahead in these matters?—Some of us look farther than others.

39,184. (*Viscount Cobham.*) They looked ahead pretty accurately for something like 50 years, did they not; I think the average was about par for 50 years?—I think that the gold discoveries, which they could not possibly have anticipated, probably helped to realise their impressions.

39,185. I think the average has been about par?—Yes, over the whole period it is about 99*l.* 6*s.*

Purchasing power of the tithe rentcharge.

39,186. (*Mr. Giffen.*) With regard to your opinion that the purchasing power of the tithe rentcharge is pretty well the same now as it was when the thing was settled in 1836, would you say that that applied to all the expenditure of the landowner; is the purchasing power the same as far as payments for wages and things of that kind are concerned?—There can be no doubt, I think, that so far as labour goes the cost has risen, and to that extent the employer of labour does not receive the full benefit of the reduction in the general run of prices.

39,187. Does he receive any benefit at all if he has got most of his expenditure in the shape of wages?—I do not think most of his expenditure is in the shape of wages, but a considerable amount of his expenditure is in the shape of wages, of course. I cannot think that the tithe-owner is not substantially benefited by the reduction of prices shown by index numbers such as those to which I have referred.

Tithe Act of 1891.

39,188. (*Mr. Little.*) I gather from what you have stated to us in evidence that the Act of 1891, so far as regards relieving the landowners where the tithe is at present excessive, has almost altogether failed?—I think that is so, judging from the representations that we have received.

39,189. One reason is that the relief is only temporary is it not—that it is only for one year?—The relief is only for one year under the Act.

39,190. And that for the year that is past, and in respect of tithes which have already been paid?—In respect of tithe rentcharge which is claimed.

39,191. Would you think it desirable that power should be given to make a reduction for a longer period than one year?—Yes. I think that both the tithe-owner and tithe-payer ought to be empowered to enter into agreements without any more restrictions than would be

Mr. T. H. Elliott.

7 Feb. 1895.

applicable in the case of two business men meeting together to make a business arrangement.

39,192. Would you empower them, without the authority of the county court, to make an agreement?—I think that some arrangement would be necessary in order to ensure that such agreements were *bonâ fide*, and not made in respect of any other consideration.

39,193. (*Viscount Cobham.*) Would you permit an incumbent to bind his successor?—With the approval of a central authority, and after due notice to the bishop of the diocese. If it is established that such agreements would be for the benefit of the living I think that they might be made, and that they should be binding for a term of years.

39,194. (*Mr. Little.*) It might make a difference to a landlord and a prospective tenant in arriving at an agreement that some alteration of the tithe should be made for a period of years?—Yes, I can conceive of cases where such an agreement as that which the Commissioner has suggested would ensure the land being kept in cultivation.

39,195. And the tithe-owner would then get something, whereas in the case of the land not being kept in cultivation he would get nothing?—Yes; I think that the tithe-owner would benefit equally with the tithe-payer in cases where such an agreement was entered into; if he did not see his way to benefit of course he naturally would not enter into the agreement.

39,196. And to prevent collusion you would require the ratification of a bargain of that kind by some authority?—Yes, or otherwise part of the consideration might be an immediate money payment passing to the tithe-owner which would obviously not be for the permanent benefit of the tithe-owner.

39,197. But subject to that ratification you would allow an incumbent or a tithe-owner to bind his successors?—Yes, I would endeavour as far as possible to make the incumbent a free agent, subject to certain notices to the bishop (who may be said to represent the permanent interests of the living), and subject to the consent of the central authority.

39,198. Then I understand that you think reducing the tithe to two-thirds of the gross annual value is not a sufficient reduction to induce the landlord to keep the land in cultivation?—I think that to take the proportion of two-thirds of the Schedule B. assessment is insufficient to induce a landlord to keep land in cultivation. I think that when so high a standard as the Schedule B. assessment is taken less than two-thirds ought to be taken as the proportion in order to arrive at the net annual value of the land to the landowner.

39,199. Under Schedule B. the landlord would have to bear his income tax, and his repairs, and his insurance—he gets no allowance for them?—That is so. I should hesitate to say with regard to the necessary outgoings that the difference between the gross and net values exceeds one-third in every case; but a deduction of one-third from the Schedule B. assessment is, I think, insufficient to arrive at the net annual value of the land.

39,200. You are aware, I presume, that where special apportionments of the tithe rentcharge were made under the original Act, no land could be charged with more than one-third of its value?—That is so.

39,201. The inference being that the tithe ought in no case to exceed one third the value?—I do not think that that is an unfair inference to draw by any means, but the object of the framers of that clause was probably that there should always be full security for the rentcharge.

39,202. In this case, under the present Act of 1891, the tithe-owner may actually recover the whole value?—That is so in extremely unfortunate cases.

39,203. In an extreme case?—Yes.

Altered apportionments.

39,203*a*. With regard to the altered apportionments, do you think that those are generally and universally applied for where there is a division of lands?—I think that the cost and trouble of applying for altered apportionments often leads to the maintenance of the charge in its present form, when really there ought to be a further apportionment.

39,204. When an estate is divided where there has been no field apportionment, and by consent the tithe is apportioned at the time of the sale, such an apportionment would have no validity against the tithe-owner?—Such an apportionment would be, of course, purely informal and invalid, and we should have no knowledge of it.

39,205. The tithe-owner would not lose his right as against the other portions of the land?—No, that is so.

39,206. And that might produce a complication in the case of an application under this Act, might it not? Suppose there had been no ratified apportionment of the charge, then the tithe-owner might say: "But you have "taken this as part of a larger proportion, upon which the "tithe was so much"?—Yes, he might do so, but no cases of that kind have been brought to my knowledge.

39,207. But it is a possible difficulty which may be in the minds of land owners who have not applied for relief?—That may be so.

39,208. There being also the possibility that the question may be raised of other lands under the clause that I mentioned to you before?—Yes.

39,209. When one piece of land has been charged with the whole tithe for two pieces, the tithe-owner can say: "You must bring the whole property into account before "you can claim any relief"?—Yes; I think, though, that the difficulties arising under those heads are probably comparatively small and infrequent as compared with the difficulties of greater magnitude which I have pointed out.

39,210. You have pointed out all the difficulties which have been distinctly brought under the notice of your department by your inspectors?—Yes. The two great difficulties are, undoubtedly, the necessity for the rectification of the Schedule B. assessments and the high proportion taken in order to give the right to relief under the Act.

39,211. (*Viscount Cobham.*) The applications for altered apportionments have mostly come from the railways, have they not?—In very many cases the applications come from the railway companies; probably in the majority of cases.

Legislation in respect to redemption.

39,212. With regard to the subject of redemption, could you give us a sketch of the legislation which has taken place in regard to it?—Yes; certain powers of redemption before apportionment were contained in the Tithe Acts of 1846 and 1860, and under these powers a sum of about 667*l.* of rentcharge has been redeemed, but as practically all parochial apportionments have been completed, redemption of unapportioned rentcharge may be said to be at an end. Under the Tithe Act of 1878 another step forward was taken. That Act, commonly called Cubitt's Act, imposes an obligation on persons taking land for certain public purposes to redeem any tithe rentcharge thereon on payment of a sum equal to 25 times the rentcharge.

39,213. Is that obligation enforceable; do you know as a matter of fact whether it is invariably done?—I believe it is not invariably done. I should be inclined to think very much on account of ignorance of the requirement, and it is no one's particular duty to see that the obligation is fulfilled.

39,214. Is there no penalty attaching to the non-performance?—There is no penalty attaching to the non-performance of the obligation. Ther., under section 3 of the same Act, the Board may order the redemption of rentcharges not exceeding 20*s.* on the application either of the landowner or the tithe-owner on the same terms as in the previous case; but in practice I may say that redemption in such cases is not ordered except on the application of the tithe-payer, on account of the expense and hardship which would frequently be entailed upon him. At a very early period after the passing of the Act the then Land Commission came to the conclusion that it would be inflicting a hardship upon the tithe-payer to compel him to redeem these small rentcharges on the terms fixed in the Act.

39,215. The terms being 25 times the apportioned value—the commuted value?—The terms being 25 times the commuted value.

39,216. And the expenses?—Yes.

39,217. (*Mr. Little.*) Is that 20*s.* on a particular close of a particular property?—It is each rentcharge as apportioned.

39,218. But suppose a man had a number of fields on each of which the rentcharge is under 20*s.*?—I think that Cubitt's Act would apply in such a case, and that it is not necessary to bring together the charges belonging to the same owner. So long as the rentcharge is under 20*s.* that is all that the Act looks to.

39,219. That might have a very large application?—It might, of course, have a very large application if the Board were willing so to administer the Act as to make redemption compulsory on the tithe-payer.

39,220. (*Viscount Cobham.*) Have any applications been made with regard to agricultural land under that section; does it not mostly apply in the case of small tithe rentcharges in towns?—That is so, but I am under the im-

Mr. T. H. Elliott. 7 Feb. 1895.

pression that cases have arisen in which applications have been made by the owners of agricultural land. But the Board's practice is that which I have indicated.

39,221. As to the payment of expenses, who are they borne by—the applicant? or are the costs divided between the tithe-payer and the tithe-owner?—The cost is included in the redemption money.

39,222. And paid by the applicant?—And paid by the person redeeming—not necessarily by the applicant.

Cubitt's Act.

39,223–5. Even if a tithe-owner has been the applicant?—Yes. Under section 4 of Cubitt's Act redemption of rentcharges exceeding 20s. may be ordered by the Board on the joint application of the tithe-owner and the landowner, subject to certain consents, the terms of redemption being again 25 times the rentcharge.

39,226. As to the operation of that section has there been much done?—Very little, indeed; scarcely anything.

39,227–8. The difficulty under section 4 would of course be that no tithe-payer would give 25 times the value of the commuted tithe rentcharge?—Yes, I think that is one of the difficulties, for he is paying a very high price for his tithe, and he is not, under existing circumstances, in a position to pay that high price.

39,229. It would be a good deal more than 30 years' purchase of the actual tithe that he pays?—It would be a good deal more. It would be between 34 and 35 years purchase. Under section 5 of the same Act, and also under section 32 of the Act of 1860, the Board may order redemption on the application either of the tithe-owner or any individual landowner whenever lands are "divided for "building or other purposes into numerous plots, and it "shall appear . . . . . that no further apportionment "[illegible] can conveniently be made." Some amount of work takes place under that section. The work is of an intricate and expensive character, and as compared with the whole amount of rentcharge the amount redeemed under that provision is very small indeed.

39,230. Is the work diminishing under section 5?—I think there has been a tendency towards the increase of work under section 5. We had about a year ago to add another clerk to the tithe branch, and my impression is that the work is increasing.

39,231. It varies with the amount of land that is being covered by buildings, I suppose?—I should hardly say that; there is some connexion between the two.

39,232. It has very little bearing upon agriculture?—It has very little bearing upon agriculture.

39,233. (*Mr. Channing.*) Is the operation of it chiefly confined to London and some large towns?—It is confined principally to the suburbs of growing towns.

39,234. (*Mr. Dalton.*) It would depend very much upon whether the landowner had forgotten to redeem the tithe before he built upon the land, I should think; he would redeem the tithe far more easily before he built upon the land if he was a large owner, because he would have saved all these very heavy expenses of apportioning it afterwards?—Yes, if he were a prudent landowner.

39,235. (*Mr. Channing.*) Is it happening in the neighbourhood around market towns in agricultural districts?—No, I think not, not to any extent, because in those cases there is very little extension, indeed, of building operations.

39,236. (*Viscount Cobham.*) I think we had better confine ourselves as much as possible to the subject of redemption as applicable to agricultural land. Now will you take the various schemes which have been suggested at one time and another, so far as regards a general scheme of redemption?—Yes. For some years past schemes for the general redemption of the tithe have been put forward, and I have endeavoured to bring together the leading outlines of those schemes. The first scheme to which I may call the attention of the Commissioners is the scheme under the Irish Church Act of 1869. In that case the Irish Church Commissioners were empowered to give 22½ years' purchase for the tithes, and the landowner was allowed to pay the redemption by instalments of 4*l.* 9*s.* per cent. for 52 years with a deduction for poor rates. The landowner under this arrangement will pay about 87*l.* 12*s.* per cent. for 52 years, when the land will become free. This arrangement was comparatively easy, because on the disestablishment of the Irish Church, the Government became the owners of the tithe, subject to the provisions of the Act.

Scheme of redemption.

39,237. Sir James Caird in 1881, I think, formulated a scheme?—Yes. In 1881 he published a scheme for redemption of tithe rentcharges, the value of which was then 107*l.* 2*s.* 10¾*d.* for every 100*l.* of rentcharge. The suggestion was that the Government should take over the tithe rentcharges and collect them, and that 75*l.* out of every 100*l.* should be paid to the tithe-owner, the remaining 25*l.* being invested at 3 per cent. so as to realise 100,000,000*l.* at the end of 47 years, when the property would be free, and there would be capital enough to continue the payment of the 75*l.* in perpetuity. We apprehend that the tithe-owner would not at that time have been willing to accept so little as 75 per cent., although the value of the rentcharge is now less than that. On the other hand, the Government would have been unable to invest the 25 per cent. of the rentcharge at 3 per cent., and would have had to provide for the cost of collection. The landowner would at once have been benefited by the reduction of the rentcharge to its par value, and its eventual cessation altogether.

Mr. T. H. Elliott 7 Feb. 1895.

39,238. (*Mr. Little.*) Was that intended as a mere average, or was it intended that the 75*l.* should be applied in all cases?—I believe that Sir James Caird, in common with others who have proposed what I may call outline schemes, assumed a figure for the purposes of discussion; but I should agree that, although it may be convenient to speak of an average, to attempt to apply it in practice if one were preparing a scheme of redemption which was to come into actual operation, would be an impossibility. The result would be, if one were to take the fixed figure of 75*l.*, that you would very considerably overpay in some cases, and underpay in other cases; there would be great dissatisfaction on the part of some tithe-owners, and on the other hand some tithe-owners would get too much.

39,239. (*Viscount Cobham.*) In those calculations I think he reckoned upon a fall in the price of tithe rentcharge, did he not?—Yes, he evidently anticipated a fall in the tithe rentcharge; and I think he must in taking this figure of 75*l.* have had in view the fact that it was convenient in thinking out these things to take an average, but that it would be necessary to have much more elasticity in any actual scheme.

39,240. Did anything come of that suggestion?—No, I think not. I think Sir James Caird simply put it forward in order to give some idea of how redemption might be effected if it were considered by Parliament desirable to do anything on a large scale.

39,241. I think he gave evidence about it before a Commission, did he not?—I am not sure of that, but, at that time redemption was very much in the air; there had been two or three very bad years—1879 and 1880—and it was one of the subjects very much talked about. I think as a matter of fact this particular scheme was put forward in an article in some periodical.

Extraordinary Tithe Redemption Act of 1886.

39,242. In 1886 the Extraordinary Tithe Redemption Act was passed?—Yes; in that case the object which the Act had in view was redemption, and very full instructions were given as to the means by which redemption was to be effected. The Land Commissioners were instructed to ascertain the capital value of the rentcharge in the manner directed by the Act, and the rentcharge itself was calculated at the rate of 4 per cent. on that capital value, and the landowners were to be allowed to redeem on payment of the capital value at any time when they pleased, but as a matter of fact the redemptions which have taken place have been very few in number, although it might have been thought that an interest of 4 per cent. would have been sufficient to have induced landowners to invest their moneys by redeeming the rentcharge.

39,243. They cannot in any other way escape the rentcharge?—They cannot in any other way escape it, and I would say that that Act is of importance in the present connexion because it gave directions as to the mode in which the capital value of a charge should be ascertained.

39,244. It gave the Commissioners a free hand in arriving at that?—It gave them a free hand, and yet it indicated the points to which their attention should be directed. There is a distinct indication in the Act as to the broad lines upon which the Commissioners were to proceed.

39,245. (*Mr. Dalton.*) The result was that it practicaliy reduced the annual charge, did it not, to one half, taking the total?—Yes; there was a very considerable reduction in the amount of extraordinary rentcharge, but the condition of feeling on both sides was very strong at the time, and the tithe-owners thought it better to accept this reduced rentcharge from year to year rather than attempt to enforce the extraordinary tithe rentcharge to which they were entitled under the law as it stood previously to 1886.

Mr. T. H. Elliott.
7 Feb. 1895.

39,246 (*Viscount Cobham.*) You would not say that the net payment to the tithe-owners was reduced by one half, would you?—There is a Parliamentary return, but I should like to verify the fact before admitting it.

39,247. Of course in return they had a certainty, that is to say, no matter whether the hops were cultivated or not the charge remained?—According to this return the gross amount of the extraordinary charge at the date of the Act was 42,991*l.*; the certified capital value was 518,000*l.*; and the resulting 4 per cent. rentcharge 20,732*l.* I think it may be said that the tithe-owner had come to the conclusion that it would be better that he should have that 20,000*l.* under the new arrangement safe, than that he should have the larger sum under the old arrangement.

39,248. As a matter of fact the commutation was effected with very little friction?—The commutation was effected with extraordinary little friction. It was proved to be much less difficult than might have been supposed.

39,249. (*Mr. Little.*) But it is an extremely different case to the ordinary tithe, where there is no power for the tithe-payer to extinguish the tithe?—The position, of course, of the ordinary tithe rentcharge is quite different.

Capital value of the tithe rentcharge.

39,250. No parity?—No. The capital value of a fluctuating and variable charge had to be ascertained, and the great interest of this Act is in this, I take it: that if it were possible for the Land Commissioners to arrive at the capital value of the extraordinary tithe rent charge, it would be still easier for them to arrive at the capital value of the ordinary tithe rentcharge.

39,251. (*Mr. Dalton.*) And if you arrived at the capital value of the rentcharge where it bears so high a proportion to the rent, and you gave the tithe-owner a fixed percentage upon that, as you did in the Extraordinary Tithe Rentcharge Act, the result would be a very material lowering of the tithe rentcharge, I suppose?—No doubt; but on the other hand, the position of the two differs so considerably, that the owner of the ordinary tithe rentcharge would be much less willing to acquiesce in an arrangement of the kind than was the owner of the extraordinary tithe rentcharge.

39,252. In the cases where it bears this high proportion to the value of the land, the cases to which that section 8 of the Act of 1891 applies?—Of course it is difficult to estimate the force of public opinion, but I am inclined to think that the owners of ordinary tithe rentcharge would not be willing to acquiesce in the capitalisation of their charge on these terms, in the same way that the owners of the extraordinary tithe rentcharge were willing to acquiesce in them.

39,253. Not if you take the extreme cases and confine the proposal to them. (*Viscount Cobham.*) The reason being in the case of the extraordinary tithe rentcharge the charge was an extinguishable one if the cultivation of hops ceased, and in the case of the ordinary tithe rentcharge it has to be paid unless the land goes out of cultivation?—That, of course, is what may happen; the landowner is able now to say that he will not continue to cultivate the land; that is what happened in the case of the extraordinary tithe rentcharge; but I do not think the owner of the ordinary tithe rentcharge, even in these extreme cases, would accept, without a very great deal of opposition, a similar proposal to that contained in the Extraordinary Tithe Redemption Act of 1886. I do not think he would feel that there is the same necessity for him to do so.

Mr. Ryde's scheme of redemption.

39,254. Then there was Mr. Ryde's scheme of 1886?—Mr. Ryde, in 1886, proposed a scheme by which the Government were to take over the rentcharges, the landowners paying them, less rates and taxes, for 47 years. Ecclesiastical tithe-owners were to receive 28½ years' purchase, and lay tithe-owners 20 years' purchase of the net value of the rentcharges, by means of the creation of a 3 per cent. stock, the interest and sinking fund of which was to be provided by the tithe rentcharges paid by the landowners. The scheme was criticised on the ground that the tithe-owners would suffer a loss of income, that the distinction between clerical and lay tithe-owners would not be acceptable to Parliament, and that the creation of stock was unnecessary.

39,255. (*Mr. Little.*) He proposed another scheme later; would it be as well to take that now? He had to abandon the scheme which you have just described?—I think Mr. Ryde never admitted himself that he had abandoned the scheme of 1886; but anyhow in 1889 he proposed a new scheme to meet what he said were the altered circumstances which had arisen since 1886. In 1889 he proposed to give the tithe-owner a new rentcharge for 100 years of 45*l.* for every 100*l.* of commuted tithe rentcharge, and to allow landowners to redeem the new charge on payment of 25 years' purchase of the net annual value of the commuted charge in the case of clerical titheowners, and 17½ years' purchase in the case of lay titheowners, less the amount to which a sinking fund to be provided out of the new rentcharge had accumulated. Small sums, not exceeding 3*l.* of rentcharge, were to be redeemed at once. This proposal did not meet with much favour. The distinction drawn between lay and clerical tithe-owners was again objected to, and the vicar of Yalding expressed the opinion that the relief to the landowner was the equivalent of great loss to the tithe-owner. He thought the Government should take over the whole tithe rentcharge, placing 2,000*l.* in respect of each 100*l.* of rentcharge in the hands of some central body to be invested at 3½ per cent. to produce 64*l.* a year for the tithe-owner, and collecting 50*l.* a year from the landowner as a land tax for ever. In the same debate the Rev. Canon Jeffreys proposed that the tithe-owners should be allowed 20 years' purchase of the commuted rentcharge, and that the landowners wishing to redeem should pay something over 86*l.* per cent., which he calculated would enable the land to be freed at the end of 50 years.

Mr. T. H. Elliott.
7 Feb. 1895.

39,256. (*Viscount Cobham.*) Those schemes would all place a heavier burden upon the landowners' shoulders, than they bear at present; is that not so?—Not all of them. In the case of the scheme suggested by the Vicar of Yalding, the landowner would have paid only 50*l.* a year, but of course the difference would have fallen to be paid by the Government. Practically the Vicar of Yalding, as I understand his scheme, would have given the tithe-owner a very reasonable sum, he would have required the landowner to pay a still lower sum, and the difference between the two would, I gather, fall to be provided by the State.

Schemes of redemption.

39,257. (*Mr. Dalton.*) In all these cases they are skeleton schemes, are they not, and you would really need to ascertain the value of the tithe in each parish?—I can only suppose, speaking from the point of view of practical administration, that they must be skeleton schemes. I do not think that any responsible Government would propose a scheme framed on these very broad lines. I think it is impossible to say that the tithe rentcharge in some of the districts in Essex should be purchased either by the landowner, or by the Government at the same number of years' purchase as tithe rentcharges which are well secured and easily collectable.

39,258. It would also depend upon the rates payable upon the tithe rentcharge, the net value of it, the cost of collection and so on?—It would depend upon the rates payable; it would depend upon the land tax; and it would depend upon the cost of collection. A great many things would have to be taken into account.

39,259. And you would find no two parishes in which it was of quite the same value?—There are no two parishes in which the tithe rentcharge can be of quite the same value; and that is shown by the figures which were given to the Royal Commission on the Redemption of Tithe Rentcharge, with regard to the actual price realised for tithe rentcharge in the open market. Each case should be judged by itself in order to arrive at the capital value of the rentcharge.

Tithe rentcharge Bill of 1887.

39,260. (*Viscount Cobham.*) In some cases it is paid half yearly by cheque with absolute certainty, and in other cases it has to be collected at a cost of at least ten per cent. or more?—Yes. That is a distinction which it seems to me must necessarily be borne in mind, when you come to capitalise the rentcharge, but it is a distinction which the law, as it stands, does not take into account; there is no elasticity under the law as it stands. In 1887, Lord Salisbury proposed in the Tithe Rentcharge Bill of that year that land should be discharged from liability to tithe rentcharge on payment by any person of a sum of money equal to twenty times the amount of the charge as fixed in the apportionment. The Bill was subsequently amended so as to make the money to be paid such sum, not being less than twenty times the rentcharge, as the Land Commissioners might approve, after giving certain notices. Provision was at the same time made for the redemption of ecclesiastical rentcharges by the payment of an annuity of such an amount and for such a term of years as might be agreed upon by the Ecclesiastical Commissioners. There was also inserted a provision for the compulsory redemption of small ecclesiastical rentcharges, on the application of the tithe owner, for 21 years' purchase of the commuted tithe, or an annuity for 52 years at the rate of 36*s.* for every 2*l.* of rentcharge. Later on, this provision was extended to lands divided or about to be divided into numerous plots, and it was made incumbent on the owner of all such lands to redeem. In 1888, Mr. Jeffreys, M.P., proposed that tithe rentcharges should

Mr. Jeffrey's scheme of redemption

Mr. T. H. Elliott. 7 Feb. 1895.

be redeemed at 20 years' purchase of the par value, the State to provide the money for the purpose and the landowner to pay 77*l.* 14*s.* 7*d.* for 50 years, of which 60*l.* would go to the tithe-owner, the balance being set aside as a sinking fund.

39,261. Was that framed upon Sir James Caird's scheme?—Yes, practically it is the same scheme, with the variation naturally suggested by the altered circumstances. In 1890 Mr. Jeffreys again proposed a scheme by which the landowner was to pay 68*l.* 5*s.* and a sinking fund of about 9*l.*, making a total of something over 78*l.*, and a sum of 1,950*l.* was to be paid to the owner of the tithe rentcharge. In 1890 under Sir Michael Hicks Beach's Bill the Board of Agriculture might order the redemption of rentcharges not exceeding 20*s.* at such a price as they might fix, having regard to certain matters specified in the Bill. Where the rentcharge exceeded 20*s.*, a similar order might be made on the joint application of both tithe-payer and tithe-owner, the price to be paid to be that named in the application or any larger price agreed to by the landowner. In the case of clerical rentcharges, the redemption moneys might be paid by an annuity for 50 years at the rate of 4½ per cent. per annum, and the Ecclesiastical Commissioners were to pay the tithe-owner at the rate of 3½ per cent. and to accumulate the balance as a sinking fund. The Bill also contained provisions as to the redemption of rentcharges on land divided for building or other purposes.

39,262. Until the Bill of 1891 neither that nor any other Bill became law?—Neither that nor any other Bill. The Government after the introduction of the Bill, which did not meet with very much favour, proposed the appointment of a Royal Commission, and the Report of that Royal Commission was presented in the early part of 1892, and is based, of course, on evidence which those Commissioners received.

Redemption of tithe rentcharge.

39,263. What are the provisions regarding redemption in the Bill of 1891?—There were no provisions as to redemption in the Bill of 1891; it was in connexion with the Bill of 1891 that the Commission was appointed. After the Bill of 1890 the Government decided to separate the subjects and to deal with the subject of recovery in a Bill which they introduced and carried in 1891, and with the subject of redemption by reference to a Royal Commission which reported in the early part of 1892.

39,264. Then it may be said that Parliament has done nothing to modify or extend the practice of redemption, at all events since Cubitt's Act of 1878?—No, there has been practically no legislative action as regards redemption since Cubitt's Act.

39,265. As regards agricultural land there is no practical redemption of tithe rentcharge proceeding, is there?—As regards agricultural land it may be said that there is practically no redemption proceeding.

39,266. Have your Board any views on the subject which you would like to put before us?—Of course the Board recognise the great difficulty of framing any hard and fast scheme, such as any of those which I have described, which would everywhere be satisfactory. They think that the circumstances are so different that it would be absolutely necessary to take into account the particular facts in each particular district. Some of those facts, such as the cost of collection, the land tax, and the amount of the rates, I have already referred to. Then, of course, the Board recognise that the landowners do not care to pay more than the capital value of the tithe rentcharge, and, on the other hand, that the tithe-owners as a rule have no wish to be paid off, because they could not invest the money to yield them anything like the same income which they now receive. So that you are face to face with the cardinal difficulty, that the landowners are in many cases unable to provide capital moneys and that they certainly would be unwilling, either by way of annuity or by way of a lump sum, to pay anything more than the present capital value; whilst on the other side, the tithe-owner really does not want to redeem at all. He is like a person who is deriving a satisfactory income from an investment the market value of which has depreciated; he does not wish to sell his stock, and he is fairly satisfied with his income, hoping, and in the case of the tithe rentcharge, not unnaturally, that he will still continue to receive it.

39,267. The redemption money of clerical tithe rentcharges always has to be paid to Queen Anne's Bounty Office, I believe?—The redemption money has to be paid to Queen Anne's Bounty Office, who invest it——

39,268. In consols?—Not necessarily, I think, in consols, but they do invest it, and appropriate the proceeds for the benefit of the living.

Mr. T. H. Elliott. 7 Feb. 1895.

39,269. (*Mr. Little.*) Has not the tithe-owner got at his back to stiffen him in his demand a conviction that a great many people look upon tithe as a public property? People who have no love for the tithe-owner still do not wish the tithe to be frittered away?—I think the tithe-owner naturally bears in mind that fact, and also that the landowner is certainly not unwilling to pay to the tithe-owner that which is properly his due.

39,270. (*Mr. Dalton.*) There is also the uncertainty, is there not, as to whether the tithe rentcharge will in future fall or rise; does that not make a difficulty in redeeming it? Does not the tithe-owner hope that it will rise and the landowner anticipate that it will fall still further than it stands at present?—I have no doubt that that is the case; but, on the other hand, I think the predominating view in the mind of the tithe-owner is that, whatever happens, he is not likely to get anything like so good an income from an investment of the redemption moneys as he now obtains, even in the present position of agriculture, from the tithe rentcharge itself.

39,271. But the landowner would also think that the longer he puts off redemption the cheaper he may buy it if the tithe falls?—Yes, I have no doubt that he would hesitate to buy in what he may consider to be a falling market.

39,272. (*Viscount Cobham.*) Do I rightly gather that at the present time you think that no satisfactory and comprehensive scheme for the redemption of the tithe rentcharge has much chance of passing into law?—If I were responsible for making proposals on the subject I should suggest that further elasticity should be given as regards the terms on which redemption should be effected, that special effort should be made to get rid of small tithe rentcharges, or of tithe rentcharges on subdivided building land, and also that some attempt should be made to cheapen the process of redemption. The two things which seem to me to be in urgent need of achievement are elasticity and cheapness.

Expenses of redemption.

39,273. But the expense of the process would not be considerable, would it, when you are dealing with considerable tracts of land?—That would be so with regard to large tithe rentcharges, but with regard to the redemptions that we do undertake, which, I admit, are nearly all confined to cases arising under section 5 of Cubitt's Act, the expenses are very heavy, and I think must necessarily be heavy. My impression is that if it were possible to obtain slight modifications of our powers, we might cheapen the process of redemption, in the first place by utilising the Ordnance Survey for the local work, and in the second place by collecting redemption money from the central office. I find that taking the redemptions on the average of the last three years the present cost of redemption is about 30 per cent. of the redemption money, and although we do not see our way to bring that cost down to much less than perhaps 20 or 22 per cent., I think we might at any rate save 8 per cent. of the redemption moneys if it were possible to induce Parliament to pass a measure enabling us to do that. But it is just one of those measures which would have very little prospect of passing through the House of Commons, I am afraid. Then we should certainly propose, in the event of any legislation on the subject, that greater elasticity should be given as between the tithe-owner and the landowner. We should allow them to come to terms, subject of course to proper guardianship of the inheritance, so as not to let a tenant for life, which the incumbent of a benefice practically is, in any way impair the permanent interest of the living; but subject to a proper guardianship of the inheritance we should endeavour to give tithe-owners and landowners facilities for coming to terms, and for making their own bargains, according to the different circumstances of each case. At the present moment redemption is only possible on a hard and fast line of 25 years' purchase of the apportioned charge.

39,274. Would you apply very much the same procedure as is adopted in the Glebe Lands Act?—Yes; I think the Glebe Lands Act has worked well in a large number of cases, and I should be disposed to give similar freedom, both to the tithe-owner and to the tithe-payer, with, as I say, proper security for safeguarding the inheritance.

Rent and tithe rentcharge.

39,275. (*Mr. Dalton.*) It is one great hardship to the owner of land that he has to pay the tithe whether he receives the rent or not?—Yes, I think it is, where the landowner has made every effort to recover the rent of the land and is unable to do so. Of course the tithe-owner would say: "If I had been in possession of the land I should have recovered the rent"; and probably you would have to prevent anything like negligence or indifference on

Mr. T. H. Elliott. 7 Feb. 1895.

the part of the landowner from prejudicing the tithe-owner. But assuming that the landowner has done all in his power to recover the rent, and has failed, I think a certain hardship does arise as regards the payment of tithe; but of course that hardship might arise as regards mortgage interest or any other charge upon the land.

39,276. Do you see any practical way of meeting that difficulty?—I think that if the Inland Revenue are satisfied that the rent is irrecoverable and abandon the Income Tax, in that case there would be ground for the remission of the tithe.

39,277. In all cases, or merely in the cases that come under section 8 of the Tithe Act, 1891?—Only in the cases which come under section 8 of the Act of 1891. Where the amount on which Income Tax is actually paid, taking into account irrecoverable rents and voluntary remissions of rents, is not one-third more than the tithe rentcharge, then relief should be given.

39,278. How would you exactly work it in for that section; the tithe is paid earlier than the rent, is it not; as a matter of practice the rent is generally allowed to be considerably in arrear?—Yes, I should think the landowner usually pays the tithe rentcharge before he receives his rent.

39,279. Before he is asked even for a remission of his rent?—Yes.

39,280. How do you provide for that difficulty?—I do not think there ought to be any very great difficulty. It might give rise on the part of the landowner to a claim for repayment of the tithe rentcharge, which might be made either in cash by the tithe-owner or by way of reduction from the next year's tithe.

39,281. But as section 8 at present stands, it is not in any way retrospective, it is only when a sum is claimed on account of the tithe rentcharge, and the court are satisfied as to certain things; then they may remit a certain proportion of that tithe rentcharge which is then claimed. Would you make it retrospective, so that if they had paid the tithe they shall get it back again if it is too much, or must it be taken into account at the next payment of the tithe?—That would be a matter for consideration. I should like carefully to examine the section in that respect. I can conceive of no really serious practical difficulty in the settlement of it. What we mean is that assuming that the condition of a landowner as regards rents be so-and-so in one particular year, then that for one year there should be relief from tithe; whether in the following year or the preceding year seems to me to be indifferent; it is simply a matter of account.

39,282. (*Viscount Cobham.*) Do you mean that where a landowner has taken an improvident or unskilful tenant which has resulted in the rent being lost, the tithe-owner should share in that loss?—I think you may say, as a rule, that the landowner will endeavour to secure as good a tenant as he can. But I am not taking the actual profits, I am simply looking at the effect of his operations upon the income tax assessments. If the State, for the purposes of taxation, allow a man relief from income-tax on the ground that rents are irrecoverable, or have been *bonâ fide* remitted, then where the tithe rentcharge approaches very closely the net value of the land, I think those remissions and irrecoverable rents should be taken into account. I am of course assuming that the principle to be adopted is the principle underlying section 8 of the Act of 1891, and I am simply proposing a wider and broader application of that principle.

39,283. (*Mr. Dalton.*) I think you said you did not think the county court was altogether a satisfactory tribunal, could you suggest any other?—I should have thought that the Board of Agriculture would be perfectly able to deal with these things. They are accustomed to issue orders in regard to tithe matters, and I can conceive of no reason why they should not issue these orders. I think that would be better than taking persons into a court against which there is always a certain amount of prejudice.

39,284. The expenses might be reduced too, I suppose?—That would depend very much upon the Treasury. It would be for the Treasury to say whether the business should be performed gratuitously or whether fees should be charged. Fees are charged for a great deal of the business that falls within the land division of which I am speaking.

39,285. It would not be necessary for the applicant to employ a solicitor, would it?—I do not think it should be, I think it would be quite easy, at any rate it ought to be quite easy, to ascertain the Income Tax B assessment from the proper tax officers, and to ascertain the rentcharge, either from the apportionment or from the information of the tithe-owner. I cannot anticipate that there is any serious difficulty in the matter.

Mr. T. H. Elliott. 7 Feb. 1895.

39,286. And, therefore, there would be a saving in substituting the Board of Agriculture for the county court in that section?—Assuming that the Treasury were willing that the business should be done without the payment of fees.

Land out of cultivation and tithe rentcharge.

39,287. Do you know of any cases where the land has actually gone out of cultivation owing to the tithe rentcharge being very high?—No, I do not.

39,288. Do you know of any cases where it has been in danger of going out of cultivation?—I think it must always be in danger of going out of cultivation when the landowner has to pay away anything like the whole of his net income to the tithe-owner. The object of the Act of 1891 was avowedly to prevent land from going out of cultivation, but I cannot say that I know of any concrete cases.

39,289. In such a case as that, the tithe is more mischievous than an ordinary mortgage, is it not?—If land is mortgaged and the mortgagee forecloses it is freed from the mortgage; but there are no means at present whereby the land can possibly be freed from the tithe rentcharge except by redemption at a price which at present, at any rate, is altogether out of the question?—I take it that the landowner might surrender the land to the tithe-owner, and say, "Take the land and get what you can out of it."

39,290. What would happen then—the tithe-owner could not sell it—the tithe-owner could not extinguish the rentcharge?—I have a reference here to a case, an isolated case, of a large farm on the Berkshire Downs which had previously actually been seized for the non-payment of tithe rentcharge.

39,291. (*Mr. Little.*) Before the commutation?—Quite recently.

39,292. (*Mr. Dalton.*) We had evidence before the Tithe Commission of cases where the tithe owners had entered into possession, but I think they had to keep an account?—Yes.

39,293. Do you not think that to meet those cases it is desirable to ascertain what the capital value of the tithe is, so that you might sell the land and pay the capital value, so far as the purchase money will go, to the tithe-owner, and then start afresh?—In the case you put, I think the suggestion that I have made, that there should be elasticity in adjusting the terms of the redemption, would meet the difficulty, that the tithe-owner would come to terms with the landowner, and that the result would be the redemption of the tithe rentcharge on equitable terms. The tithe-owner does not want to be burdened with the possession of the land if he can help it.

Tithe and rental value of land.

39,294. Are there no cases where the tithe is now equal to the rental value of the land?—I should think there are cases.

39,295. And some where it is over?—I should think there are some cases where it is over.

39,296. Then what interest has the landowner in redeeming in that case; his interest has practically disappeared?—On the other hand the tithe-owner might not wish to force matters to extremities any more than a mortgagee may be anxious to enter into possession of the land. I think a tithe-owner would very often be less anxious to enter into possession of the land, but at any rate he has a charge on the land which is in excess of its annual value.

39,297. Still where land is mortgaged beyond its value the remedy comes by the land being sold and changing hands, and being let go free from the mortgage?—Not always; there are many mortgages which remain in existence for a very long time after the value of the property has become less than the mortgage.

39,298. Still in a considerable number of cases that remedy is applied?—Mortgagees are very often most reluctant to foreclose.

39,299. Yes; if they do not think they will get the value, and it is not a good time for selling; still a great number of mortgagees have foreclosed?—That is so, of course.

39,300. Then the land starts free, and will be cultivated if it is worth anything?—That is so.

39,301. But it is a great disadvantage in the tithe that when it is equal to, or even exceeds, the value of the land there are no means of getting rid of it in the open market by selling the land, and so letting it start free?—I think if

Mr. T. H. Elliott. 7 Feb. 1895.

landowners and tithe-owners were free to do one of two things, either to agree to a reduced rentcharge for a term of years in accordance with the plan which has been previously considered to-day, or if they were free to come to terms as regards the redemption of the rentcharge, then that deadlock would be removed, and my own opinion is that neither tithe-owner nor landowner would be very unreasonable in a case such as that which the Commissioner puts, and terms would be come to. I hesitate to think that compulsion is necessary. I think that if you had a free agent on both sides, if you had a free tithe-owner and free landowner, then if they were sensible men they would come to terms.

39,302. (*Viscount Cobham.*) Do you not think that if the landowner could redeem so as to bring him in 3 per cent., a considerable number of the more wealthy owners would be glad to redeem and relieve their property?—I do not think that landowners are, as a rule, able to do so or that they are very much inclined to do so. We have the experience of the Extraordinary Tithe Redemption Act. There must be many wealthy landowners in the districts subject to that charge, yet they seem to be unwilling to redeem though they could secure 4 per cent. And in a very considerable number of cases landowners are quite unable to find the money.

Mr. T. H. Elliott. 7 Feb. 1895.

39,303. (*Mr. Dalton.*) How did you arrive at the capital value of the tithe rentcharge under the Act of 1886?—The Commissioners were required to take into consideration the net annual value of the charge after allowing for expenses of collection, and they were also required to take into account very many other circumstances which might affect the value of the charge. Then the Commissioners were to determine and certify under their seal the capital value of the charge, and before doing that they had the advantage of the information obtained by Inspectors or Assistant Commissioners, who visited the parish, and held an inquiry at which all the parties concerned were heard.

39,304. When they had got the net value, what number of years' purchase did they take? Did they take it on the 4 per cent. table, or the 5 per cent., or the 6 per cent. table?—They took varying numbers of years' purchases according to circumstances. I have now to hand various memoranda and tables which I promised to submit to the Commission in connection with my previous evidence. (*See* Appendices A. XX., XXI., XXII.)

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

(*For witness's further evidence see page* 318.)

Seventy-Third Day.

Friday, 8th February 1895.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. T. Crawford, Esq., Alan Mackinnon, Esq., } *Assistant Secretaries.*

Mr. Herman Biddell called and examined.

Mr. H. Biddell. 8 Feb. 1895.

39,305. (*Chairman.*) You are land agent residing at Playford, near Ipswich?—Yes.

39,306. And you have farmed from 100 to 600 acres from the years 1853 to 1892?—Yes.

39,307. Have you been in connexion with Mr. William Biddell, of Lavenham Hall during that time?—Yes.

39,308. He was one of the oldest and most extensive land agents and valuers in the county, I believe?—Yes.

39,309. Have you an intimate knowledge of all parts of Suffolk?—Yes, I think of all parts.

Effects of depression: (a) on large landowners;

39,310. Will you first describe the effects of the depression upon the larger owners of property?—They are very much reduced in income, and many of them are not residing on their estates; and that, of course, has a very ill effect just round where their mansion was. If the estates are unencumbered, no jointures to pay out of them, they have simply a reduced income; but where a large estate has jointures to pay out of it, and mortgages, the owner is not in the position of what we call a landowner at all now. He goes abroad and lets his mansion and the shooting.

39,311. What size do you consider the largest estates?—From 3,000 to 10,000 acres, but we would hardly call an owner of 3,000 acres a large owner, perhaps.

39,312. Are the mansions generally let or not?—They are let where they can let them with the shooting; but you can hardly let a mansion unless there is shooting with it, unless it is close by a town.

39,313. Where the shooting is let, do you find that generally a bad feeling grows up between the shooting tenant and the farming tenant?—I should not like to say generally, but I know of a good many cases where there has been friction between the farm tenants and the shooting tenant. The shooting tenant comes down for a day or two, he spends no money, and he does not reside in the mansion, except just for the fortnight he is shooting, and the tradesmen and people complain of it very much.

(b) on small owners;

39,314. Then with regard to the smaller owners of land, how are they affected?—They are worse off; that is to say, most of the small owners are, if they are entirely dependent upon it. I should say that some of the large owners in our county own large town properties, and the town properties keep the country properties going, and they are enabled to meet their tenants. There are a good many in that position; I know several estates in Suffolk that are so situated, and outwardly there is no sign of depression at all; they have met their tenants well; they have good cottages, and altogether they are in a good state, because they make their town properties keep their country properties going. But the small owner has very seldom anything of that sort.

(c) on occupying owners.

39,315. Coming to a still smaller class, that of the occupying owners, men who own and occupy their own land, what is their position?—If they have nothing more than the land they own they are simply reduced to poverty; that is to say, they have got the tenant's losses as well as the landlord's losses.

Mr. H. Biddell.

8 Feb. 1895.

39,316. Are there many persons of that class in your county?—Yes, I think so. I know a good many.

39,317. What size holdings would they have?—They would perhaps own from 200 to 500 acres, or something like that.

39,318. They belong rather to the yeoman class than to the occupying peasant class?—Yes, they are men who were left pretty well off with 500 acres of land of their own at one time, but the depression has robbed them of all rent, and if they occupy it they have had the tenant's losses too.

39,319. Are there cases of still smaller owners and occupiers?—Such men as those who own from 30 to 50 acres have very seldom bought an estate and paid for it right out. They have, most of all, had to raise the money by mortgaging. There are very few men who have bought such a thing as from 30 to 50 acres and paid for it right down and had no more. They either owned other property or they were little men that borrowed so much money to pay for their estates.

39,320. Are there many such cases?—Yes, I think there are a good many of those.

39,321. I mean are there many small owners of from 30 to 50 acres who cultivate their own land in your district?—I should not say many. I do not think we could apply that to them. I know instances of some, but I should not say there were many that were of just that class.

Large and small farmers compared.

39,322. Now coming to the larger farmers, do you think that they have stood the depression best?—Yes.

39,323. Have they generally capital beyond that engaged on the farm?—Yes, the larger farmers, I think, mostly had capital elsewhere.

39,324. And the medium and small holders; how do they stand?—They are badly off. The medium or small holders are the men that put their all into their farming business when they went into business, and some even borrowed money to do that, but perhaps not very many.

39,325. They have nothing else but their farms?—If they had all their capital invested in the farms they occupied, those men are mostly gone. They have had to come to a composition, or something of that kind.

32,326. Then in the case of the small holders, those under 50 acres, have they generally some other occupation?—Yes, most all of them are carriers, or perhaps little pig dealers and poultry dealers, and do a little carting for other people. Some of them have kept going, but it has not been the land that has kept them going. They have had to keep their farms by what they have done outside their farming occupation.

Agricultural labourers. Wages.

39,327. Then with regard to the agricultural labourer?—The agricultural labour who is in work has nothing to complain of now, but there are a great many out of work. I think a few years ago—we will say three years—before wages were dropped materially, the labouring man was better off than I ever knew him in my life, but the wages have been considerably reduced these last two or three years.

39,328. When did the reduction begin?—The reduction did not begin so soon as the prices fell. They kept on the same wages, we will say, from 11*s.* or 12*s.* a week, which was about the average, for a good while, even when wheat got down to 30*s.* a quarter; there were a good many paying 12*s.* then, but they were paying the money out of their own pockets; they were not paying it out of the profits the farm yielded, I think.

39,329. When did the great rise of wages take place; was it in 1873?—I should think they were higher then than at any time, but they got up gradually, you know; the price of produce did not increase, but the labourers were paid more than they used to be.

39,330. When did the rise occur?—I should think from the year 1860 to the year 1875, roughly speaking.

39,331. Have the wages gone back to what they were before they rose, or not?—Yes, they have quite gone back to that in the worst districts.

39,332. In the worst districts?—That is to say, where it is purely arable land.

39,333. But in other parts of the country?—Yes, I should say the farmers are paying, say, 11*s.* a week or 10*s.* a week, or about what they were paying in 1860, I should think.

39,334. Then the labourers still get the advantage of the low prices?—Those that are employed.

39,335. (*Mr. Lambert.*) What were the wages when you think the labourers were better off than at any other time?—About 12*s.* a week—say four years ago.

Mr. H. Biddell.

8 Feb. 1895.

39,336. Would that include any privileges?—No, that was the nominal day wages; then at harvest the man would earn quite double wages for five weeks; then in haysel he would have overtime, or at least he would be paid something extra.

39,337. How much would he get weekly, including all this?—I think in the case of a man having 12*s.* a week nominal wages, if you were to go through the books, you would find it amount to 14*s.* 6*d.* or 15*s.*—at least 14*s.* a week. Twelve shillings a week would represent 14*s.* a week in the year.

39,338. How much would he get now?—I do not know, there is very little.

39,339. How much have the wages gone down?—The harvest last year was very much reduced in some places, but the harvest wages of 1893 I think were not reduced at all.

39,340. Could you give us an estimate of how much the wages have gone down from the 14*s.* 6*d.* a week—how much they are now?—They have gone down 3*s.* to 4*s.* I think there is less extra wages earned now in proportion to the day wages than there were when wages were high.

39,341. Would you say that 11*s.* per week would represent the average earnings of a labourer at this moment, that that is the average wage that would be paid to him?—Yes, if you exclude harvest.

39,342. How much if you exclude harvest?—You may say about double wages—that would be about 1*s.* a week spreading it over the year; he would earn 50*s.* more in harvest than his wages would have come to, so you may put that at 1*s.* a week, or something like that. The drop in wages since the good time to now has been from 3*s.* to 4*s.* a week.

39,343. You said 14*s.* 6*d.* with the harvest wages, and then 11*s.* without the harvest wages?—I beg your pardon; when I said the 14*s.* 6*d.* it would not include the harvest wages. I meant taking his overtime, but not the harvest. I think they would have amounted to 14*s.* 6*d.* without the extra money that he would have earned during the harvest.

39,344. (*Chairman.*) Then what it means is this, that at the best of times the average wage throughout the year, taking into account harvest work, was from 15*s.* to 16*s.* a week?—Yes, I should think so.

39,345. It is now reduced about 3*s.*, and has come to from 12*s.* to 13*s.*?—From 3*s.* to 4*s.* a week, I would say that I think it was reduced.

39,346. Therefore it is now from 12*s.* to 13*s.* a week if you include the harvest work. Then at the present time is there a great want of work?—Great want of money to pay them. There is no want of work, but there are a great many men out of employ. There is as much work to be done as ever there was. There is a great deal left undone that should be done, and, if the farmers had the money to pay, would be done. But the men who are out of employ make no impression; they are young men and some go for soldiers, and some go into the police, and most of them live at home in the parents' house and earn up to 2*s.* and 3*s.* a week at extra work, droving on the market days, or at occasional jobs; but flour is very cheap, and they do not go into the union. So those men out of work do not appear at all, but they are out of work; you see them standing about.

39,347. Has that been exaggerated, or is it purely due to the bad weather of the last five weeks?—No, I would call that a temporary cause. I am not speaking of that; I am speaking of directly after harvest last year and all the autumn.

Condition of Suffolk land.

39,348. Is the land in Suffolk getting into a bad state?—Very bad indeed, and it gets worse every year. I think it will take a great deal to restore the county of Suffolk to the cleanliness and the fertility that it was in the year 1874.

Bad seasons.

39,349. Has your district suffered during the last three years from bad seasons?—The harvest in 1893 was a very bad harvest. This last year there were heavy crops grown, but the heavier the crops the worse the quality, with barley at any rate, and they did not come to much.

39,350. Had you not a bad season in 1892—a wet season?—I cannot call to mind exactly what 1892 was.

39,351. In 1893 you had a severe drought, and the result was a very bad harvest?—Very, indeed.

39,352. In 1894 you had abundant crops, but of very poor quality?—Exactly so.

39,353. Therefore you had two bad seasons practically?—Two very bad seasons I should call them.

39,354. (*Mr. Little.*) Are you speaking of the whole of Suffolk or of a particular neighbourhood when you say 1893 was a very bad harvest?—I do not think in any part of Suffolk they had good crops in 1893.

Tenure.

39,355. (*Chairman.*) Are there any long leases now held by the tenants?—No, I do not think any tenant within the last four or five years has hired a farm for a long lease; I have not met with any.

39,356. Used there to be leases taken in your county or not?—No, I think there are a good many farming with a two years' notice to leave.

39,357. Generally on a yearly tenancy with two years' notice?—Yes, with almost unrestricted cultivation till the last two years or one year.

39,358. And during the last two years or one year?—Then they are obliged to leave it in the four-course shift, so that some one coming in would know what he was going to take.

Dairy farming.

39,359. Has dairy farming been substituted largely for arable farming?—You can only do dairy farming with a certain quantity of pasture, and near the towns there is a good deal of pasture which has been laid down and farmed well for cows. Cow farms are more in demand than anything else, and they are very much reduced in value.

39,360. Has dairy farming increased very much in the county?—I should think it has.

39,361. You think it has?—I am quite sure of it; very much within this last 10 years.

39,362. (*Mr. Channing.*) As much as in Essex?—I do not know the county of Essex, except what I read about it.

Beetroot cultivation.

39,363. (*Chairman.*) Have you tried the beetroot in your district?—Only in the neighbourhood of Lavenham. Mr. William Biddell I think used to take 700*l.* or 800*l.* a year for roots grown on the farm—sugar beet. There were several others who did a good business in that. That was when the growth of corn was encouraged very much more than it is now. I am inclined to think that if we could have sugar factories started we should have a great many avail themselves of the growth of beet, but I am inclined to think that the reason why the great factory at Lavenham was closed was because there was not sugar enough perhaps in the beet grown in this climate to pay for the manufacture. I think that was the reason; it certainly was not because farmers would not grow the beet.

39,364. That was from want of sun, I suppose?—I do not know; but I know one of the most intelligent men who had been in that sugar business a good many years—Mr. Duncan—tried it with unlimited capital, and he gave it up, and it was not because he could not get supplied, because there were people ready to grow the beet.

39,365. (*Mr. Chaplin.*) Is it not because of the sugar bounties?—My suggestion was that the beet did not produce sugar enough to pay for production. Of course if the price of sugar had been higher it might have paid.

Effect of the depression on rural tradesmen.

39,366. (*Chairman.*) Then generally speaking has the rural population other than that of the agricultural population suffered?—The tradesmen of all sorts, the wheelwrights especially, and the blacksmiths, who used to keep the farming rolling stock, have suffered very much. I think the agricultural implements are getting down dreadfully in the county of Suffolk. Where a man used to keep his waggons well up, his wheels and all his harrows in a good condition, and keep a good rolling stock, they are simply left now to get run down; and if you go to a sale now the implements are in a marked degree worse than they were 15 or 20 years ago.

Low prices.

39,367. Now coming to the causes, what in your opinion are the causes?—There is only one cause, I think, and that is the low price of produce. What has produced that is another thing, but I know that is the cause of the depression.

Importation of flour.

39,368. Then what remedy do you suggest?—I think one thing we have greatly to complain of, that is that the American or the foreigner is allowed to send in flour, and if you calculate the amount of flour sent into this country from America, you will see what we lose in the offal. Almost one-third of the produce that made up that flour should have come over here in offal and bran; we are deprived of that offal and bran that that flour was accompanied by when it was grown. If the wheat is imported whole, I believe it would come over just the same; I do not believe we should have a hundredweight less food imported into the country, but we should have an immense quantity of offal to feed with. I was farming in the years 1848, 1849, 1850, 1851, and 1852. I then bought bran, better bran than you can buy on the market now, because the milling trade had not got to the perfection of taking all the flour out—I could then buy bran at less than you can buy it now, and the price of wheat was nearly double as much. So that will tell you that we are now getting the flour, but we are deprived of the offal that we used to have for feeding stock. If we could keep the barley trade going, if we could only be certain of something like 30*s.* or 32*s.* a quarter for barley, the land that is now going out of cultivation would not go out of cultivation. I should like to see the duty taken off tea and put on all barley at the port, and all matter that was brewed from.

Duty on barley.

39,369. Is there much consumption of cheap barley in your district?—They are forced to it, but this year there is really more feeding barley than can be fed with. People are selling it; what is to be done with it—I suppose it is distilled—they do not know. There was one very large farmer near Bury St. Edmunds that offered all the growth of his barley this year at 12*s.* a quarter.

39,370. (*Viscount Cobham.*) It was a good deal damaged, I suppose?—It went down; it was the effect of the bad season, I admit; it went down in the straw and it only came to a poor sample.

39,371. (*Chairman.*) Then you have suffered a great deal this year from the inferior quality?—Yes, very much this year, so far as the barley goes, but there is nothing to complain of in the quality of wheat.

39,372. Barley is the staple product of the best land in Suffolk?—Very much so; if we could get a good price for barley, I would say we might almost do without an enhanced price of wheat which you may take at 8*s.* or 9*s.* a comb, that is to say, 16*s.* or 18*s.* a quarter. I will not be quite confident about that, but the growth of barley on all heavy land in Suffolk is very much what the farmers' pockets are filled from. We should of course have more acres of barley if it was at a good price, and less of wheat.

Cost of production.

39,373. Has the cost of production increased in your district?—The tradesmen's bills are not reduced at all. We pay more now I think for shoeing, and quite as much for plough irons, and the blacksmiths' bills, and the tradesmen's bills, as we used to do, when we give any employment; but there is much less employment given in that way; I do not know that it has increased at all. The labouring man when wages were high, had the thing in his own hands; that is to say, when the wages were high and labour scarce he would only work the number of hours he liked in the day, and he was very much averse to "taken" work. Now of course men that are glad to work, take it at a less price and get a little money in that way.

Rates.

39,374. Then with regard to rates?—I am inclined to think, with the exception of the imposed rates lately, like the school rate, we will say, which was quite a new thing within my experience, the rates are much the same as they were.

39,375. Do you mean the same rate in the £?—No, I am speaking of the payments, I was going to make this observation before the Union Chargeability Act was passed where the assessment of the farms only affected the individual farmers in a parish, there were a great many farms under-assessed, very much below their renting value. Then when the Union Chargeablity Act threw the mischief of the thing on to the whole union, they then assessed the farms at more near what they were let at, and therefore though the rate in the £ is no more now the assessment is greater and we are paying quite as much, if not more than we were.

39,376. (*Mr. Dalton.*) How far back are you speaking of?—The Union Chargeabilty Act must have been passed about 20 years ago I should think—I do not know just exactly.

39,377. (*Mr Chaplin.*) In 1865?—That is 30 years; then it is much more than I thought it was.

39,378. (*Chairman.*) That was followed by the raising of the assessments?—It was. It did not come at once, but they were gradually raised.

39,379. As compared with say 20 years ago the assessments have not been raised I suppose?—Yes, they have been gradually raised, till these great drops in rent came.

39,380. What is your union?—Woodbridge; there are just 52 parishes; it is a large union, I have been guardian something like 33 years, so I know something of it.

Mr. H. Biddell. 8 Feb. 1895.

39,381. I see there has been a great reduction of the assessment of land in Woodbridge Union according to the return we have had?—There seems to have been.

39,382. There assessment on land has been reduced from 92,000*l.* to 69,000*l.*—just about 25 per cent.?—Yes, lately.

39,383. Therefore the assessment has been reduced in proportion to the reductions of rent, I suppose?—Not quite, for we have one instance in the county of Suffolk that is likely to come before the public in a more emphasized form. A farm was let at 90*l.*, I think that was the letting value; it was up, or, at least, it was advertised month after month, and at last a tenant gave 90*l.* for it. I do not how many acres there were, but that was assessed at 160*l.* He appealed to the assessment committee and they refused to reduce it; he took the case to the quarter sessions and they would not alter it; and so that farm now stands at a rate of something like 160*l.* a year, and the utmost they could make of that farm was 90*l.* a year. Now, I think, they are going to bring that to a higher court. That is an instance of how the assessment committees are holding out, but I believe since that has got abroad and much talked about a good many of the assessment committees are reducing assessments to something near the rent. I do not know why they should be more than the rent at all.

39,384. In this case you say the quarter sessions refused to reduce it?—They refused the appeal in fact.

39,385. Do you know on what general ground the assessment was maintained?—The chairman of that assessment committee was at the meeting of the East Suffolk Chamber of Agriculture, and it was put to him there, but he very rightly observed that he had no business to give the reasons at our chamber that were given on the consideration at the quarter sessions. But at the same time they gave no reason, and I think they ought to have given a reason.

39,386. Was it maintained at the same kind of rate as the adjoining farms, was that the form?—No, it was not, because they had not been re-let, and if people please to give a certain rent for a farm, they must consider it worth what they give, and it should be rated accordingly.

39,387. Is it your view then that it should be the actual rent that is given, that that should be the sole test?—Yes.

39,388. And that there should be no consideration of the general value of land adjoining or in the neighbourhood?—I suppose that was so. The general rent paid appears to be more than the worth of the farm, because that was one put up for letting and no one would hire it, except at a very low figure.

39,389. Although the land has been considerably reduced in value, I observe that the assessment on railways has been largely increased?—It ought to have been.

39,390. It has gone from 500*l.* a year up to 10,000*l.* a year?—It was time, because a good deal of the railways that went through Suffolk with deep cuttings and deep embankments were only assessed at about feeding value or very little more. It was quite time that they should be altered when they were altered.

39,391. I only note the fact?—It is so, and that was the reason.

39,392. It is an interesting fact; in fact, your union is an interesting one altogether in that respect. Although the rate of the assessment on land has gone down 25 per cent., the assessment on houses has risen from 32,000*l.* to 59,000*l.*, and the assessment on railways from 500*l.* to 10,000*l.*?—Yes.

39,393. The general result is that the assessment has been increased from 120,000*l.* to 141,000*l.* since 1870?—More than that; the increase has been very much later than 1870. The increase in the assessment of the railway property took place very much since 1870.

39,394. (*Viscount Cobham.*) Have there been any new railways made since 1880?—No, we have had no new railways made for 20 years in Suffolk, I think.

39,395. (*Chairman.*) I am comparing the year 1870 with the year 1894; in that period the total assessment of the union has increased from 126,000*l.* to 141,000*l.*, although the assessment upon lands has been reduced from 92,000*l.* to 69,000*l.*?—I think that rise in the assessment of the railway company would have taken place very much less than 24 years ago.

39,396. Do I understand you that the rate in the pound has remained about the same?—Perhaps a little less.

39,397. Perhaps a little less?—Yes, I think less; but the assessment was larger, so that there was not that reduction that the alteration of the money in the pound would represent.

Mr. H. Biddell. 8 Feb. 1895.

39,398. But still, comparing 1870 with the present year, the farmers appear to have had the benefit of a reduction in the assessments?—Yes.

39,399. If the rate in the pound was also reduced they must have benefitted also in that way?—Yes; but the reduction of the assessment has gone on gradually, that is to say, lately the assessments have been reduced very much.

39,400. Then quite lately the farmers have had the benefit of that?—Yes, and the farmers so far have had the benefit of taking the highways into the county council and of the grant we have from the Government there.

39,401. What are the average rates in your district now?—I cannot tell you.

39,402. You cannot say?—No; I cannot.

39,403. Are there many school boards in your district?—Yes.

39,404. In purely rural districts?—There are a good many voluntary schools.

39,405. What does the school board rate generally come to in your district?—I should think about 9*d.* in the £.

39,406. Should you say that the other rates are 1*s.* 6*d.*?—They are more than that in the £, taking the surveyors rates.

39,407. You cannot say what?—I should think 2*s.* 3*d.* to 2*s.* 6*d.*

Tenure.

39,408. Is there any complaint made in your district of the system of tenure?—The tenants have got it all their own way, if there is, for we are not very nice, neither land agents nor owners, what the system of tenure is, if they have any appearance of paying the rent. They may cultivate as they like and have the shooting, or do anything, provided they leave it at the last year so that somebody else will have it. We are too glad to hear of somebody that will hire some land. We are not so nice upon the terms.

39,409. You have heard no complaint upon the subject of tenure?—Not in the county of Suffolk at all.

Judicial rents.

39,410. Have there been any resolutions of farmers' associations in favour of judicial rents?—Not in the county of Suffolk. I hear something of it in the Adelphi, at the Central Chamber of Agriculture from the west of England, but we do not understand it. I never heard it asked for in the county of Suffolk for many years.

39,411. Never heard it asked for?—I have not heard it asked for for many years. I do not know what it was many years ago.

39,412. (*Mr. Lambert.*) Many years ago; was there a demand for it then?—Not very loud. In my neighbourhood there was a very good feeling between the landlord and tenant when prices were remunerative. As to the game question, people hired game farms and the hares ate up the crops; but I have known this all my life, for I shot on the estate for many years, that on the side that was most afflicted with game there was the least change in tenants; but they were allowed liberally for it, I think.

Unlet farms.

39,413. (*Chairman.*) Are there many farms unoccupied in your district?—A good many are unoccupied by tenants, but they are farmed by the landlord.

39,414. A good many are farmed by the landlord?—Yes; those that have got any money to farm with at all.

39,415. Is there much difficulty in finding tenants?—A great deal; there is one estate near me where I happen to know—I think I am right—there are five farms that would average nearly 1,000 acres each, and they are all in the landlord's hands. 20 years ago, as a land agent, I could have brought him a tenant for every farm in a month for those five farms, and they would have stocked, every acre of them, 20 years ago.

39,416. Is that partly on account of the size of the farms—that it is difficult to find farmers with capital enough?—It is this: that those that have got capital enough to farm 1,000 acres of land are very careful of putting it into farming at all.

39,417. Is there a greater ease in finding tenants for small farms?—Yes, I think so; but this land that I am speaking of is sheep land—you would not farm it in small lots. Now this land, very much of it, is land that is laid down to grass; we call it laid down to grass, but it is

Mr. H. Biddell.

8 Feb. 1895.

simply not ploughed, and the herbage is indigenous to the soil; then the sheep run over it.

The Agricultural Holdings Act.

39,418. Then with regard to the Agricultural Holdings Act, have you any observations to make about it?—Very few indeed are under it, I think that all made their own bargains, and I think both landlords and tenants have backed out of it. I believe what is said is that the tenant says: "I dare not commit myself to the Agricultural "Holdings Act, because if I do, I shall be obliged to "conform to the landlord's part of it," and he is just as much afraid of what the landlord would charge him with, as the landlord is afraid of what the tenant's bill would be.

Substituted agreements.

39,419. (*Mr. Channing.*) Are the agreements that are substituted for it generally considered fair?—Yes; now the tenant can make them fair at any rate; but I never heard much complaint in the county of Suffolk about the neccessity for an Agricultural Holdings Act.

39,420. (*Chairman.*) When a claim is made under the Act has the landlord then a right to make a counterclaim for dilapidations?—I do not know what the interpretation of the words of the Act strictly are, but I have never had a case (and I have been a land agent in all parts of Suffolk) where we were under the Agricultural Holdings Act.

39,421. Never had a case?—No, never; and never had a case where the tenant asked to be thrown back on it.

39,422. Do all cases that have occurred in your county come under a custom or an agreement?—Under an agreement which very much is interpreted by custom.

Counterclaims.

39,423. Then, in those cases do you find that the landlord makes a counterclaim for dilapidations?—Yes; the valuer who represents the incoming tenant virtually represents the landlord, and if he was obliged to repair certain parts of the buildings and pay the half labour, which was the usual condition, he would be called upon to pay the sum that would repair it under that proportion; that would be one case of dilapidation.

39,424. That would be under a special term of the agreement?—It would be the general term of the agreement. Most all agreements would be that the landlord does the repairs—finds all the material—but the tenant pays half the labour. That would apply to gates and all rails in the fences of the farms, and stiles, and so on.

39,425. Then according to your account the proceedings generally are outside the Act, under agreement or under custom?—Yes, under agreement, and if the particular point is not included in the agreement it is settled by the two valuers employed.

Restrictions.

39,426. Have the restrictions to a large extent disappeared from the agricultural agreements now?—Yes, I think tenants very much are allowed to sell straw and sell hay, and do what they did not use to do, provided the last year they do not sell hay, or do not sell straw, or do not cultivate more than a half in corn, and so on. It is simply done so that the incoming tenant has straw and has a fair quantity of land coming for corn. What is best for the tenant I would say is best for the landlord if a man hires it for any length of time, but there are a great many farms now in good condition in the county of Suffolk that when they are to let are hired by people who have an idea of farming them for some years and then giving them up in a worse condition.

Ground game.

39,427. What has happened under the Ground Game Act in your neighbourhood?—I do not think the Ground Game Act has had much effect at all. It strikes me that if we had had wheat making 45*s.* a quarter we should have had as many complaints as ever we had, because the landlord would simply say, "You understand I am going to "keep hares here; if you do not like it you will have "notice to quit," and he would hire the land accordingly; but now, when the tenant can go and find a farm where he likes, he is enabled to say he is not going to have the hares. The tenant can say he will go somewhere else; and so I think the landlord drops his love of hares. I do not know that the Ground Game Act has anything to do with it.

Low prices.

39,428. Your main hope for a remedy is better prices, I suppose?—The entire hope. There are alleviations, but nothing that I have heard pointed out as an alleviation would keep a great deal of land in Suffolk in cultivation at all. We must have better prices.

State loans.

39,429. Then with regard to the proposals for State loans what have you to say?—I know some land in the county of Suffolk that was drained many years ago. The Government supplied the money, and it was to be paid off in so many years; that entailed such an increase of rent that no landlord now would dare to borrow money to increase the charges on his land at any price; he would not entertain the idea.

Mr H. Biddell,

8 Feb 1895.

Tithe.

39,430. Then with regard to the reduction of the burdens on land?—I think one cause we have for complaint, and the only cause against the Tithe Act, is this: that when the Tithe Act was passed every provision was made to get a fair average price of the corn grown, but since so much has been used on the farmers' own premises the worst kind of corn has never come into the market at all, so that we do not now get a fair average of the price of corn. I think that we have to complain of that, but it is now more a landlord's question, and I do not think the tenant farmer is concerned with it.

39,431. It does not affect the tenant farmers?—No, not now at all, and only to that extent did it ever affect the tenant farmer, because he took the consideration of what the tithe average was into account when he hired the farm, and he made provision accordingly in the bargain.

Butter factories.

39,432. Do you think anything is to be done in the direction of butter factories, so as to get a uniform produce?—Yes, the complaint is that we cannot make butter to sell in London as the foreign butter is sold, that no merchant in London can secure a supply worth taking into consideration at all. While each individual farmer makes his own butter he has to sell it in small quantities, and you cannot get it twice alike; the farmers do not make it alike; no merchant in London will come and buy it, so it will have to be sold in a kind of local retail trade; but if we can secure butter factories by having them in certain centres, and the butter companies would send round and fetch the milk, and would apportion the returns according to the milk produced, I think something might be done. A farmer only keeping 8 to 10 cows cannot profitably send the milk in the morning to a station unless it is quite close by, and therefore that stops the milk trade, and the milk trade is better than the dairying at any time. I have kept from 30 to 40 cows nearly 40 years. I know something about the retail trade and something about the making of butter, but even the quantity I produce could only be disposed of to local buyers.

39,433. (*Mr. Channing.*) Have you been able to start any combination in that direction?—There is nobody who has got any money to start it with. If the Government or somebody would start a factory in one district we could see then whether it would do anything. The *sine qua non* would be that the farmer had not to send his milk. The milk from 10 farms could be collected at a quarter the price that it could be from one farm. I think there might be something done in that way.

Fruit culture

39,434. (*Chairman.*) Then with regard to fruit culture, do you think anything is to be done in your district?—You could not start fruit growing at a time when all the farmers are nearly ruined. I must say I have offered when I was agent for a large estate in Suffolk, on a farm we could not let, to make a large orchard. The tenant had already got one orchard. He said to me, "What is the "use? I have had some man here from the town about "these apples, and have been offered 3*s.* a sack this "year." He would not hear of my planting trees for the orchard. I do not think there is much to be done in that direction.

Co-operation.

39,435. With regard to co-operation in buying, do you think there is anything to be done there?—Yes, I think, if we had a market in London for the sale of our butter, and so on, paying a man a salary that would make it worth while for him to do his best, with no ulterior object of getting the trade into his own hands, we could do something; but you no sooner start even a milk trade in a town but what your agent, as soon as he has got a good trade, says: "Now I think I will take the business myself;" and you have no protection against it. There is a great deal of difficulty in that. But still if one could have an honest agent in London to dispose of the produce and a week before he could know what each farmer could send up, I think something might be done even with that. The middlemen do not say anything about profit, but if you send a small quantity up, and trust even a first class agent in London, you are sometimes lucky if you get your baskets or your sacks back, to say nothing about the profits.

Importation of flour.

39,436. (*Mr. Everett.*) In regard to the offal question in the importation of flour, do you not think it would be the case that most Suffolk farmers sell more bran on the back of the wheat than they buy?—They ought to buy very much more than they sell, whether they do or not. If we get it over from abroad they ought to buy very much more than they sell, and would. I tried to lay my hands on the amount of flour imported just to see what it was,

Mr. H. Biddell.
8 Feb. 1895.

but I have not been able to do so. I cannot but think on the broad question that as we get so much flour sent over, and as all the offal which belongs to that flour is kept on the other side of the Atlantic, it must be bad for the farmer.

39,437. My point is this: do you not think that the average Suffolk farmer sells in the form of whole wheat that he grows, more offal than he buys back as offal?—Yes, it is so.

39,438. He sells more?—Yes, but simply because the price is an artificial price of what he would otherwise buy. If it was a natural price, and we had all the offal from the wheat, he would have it, because it would come at a price that he could buy it at. I was in business farming in 1848 and 1850, and I bought bran then—as good bran as was taken—at 4*l.* a ton, and even at less than 4*l.* You have to give them the same price now, and wheat is only half the price. I tell you at once we do not get the offal we ought to have.

39,439. If, as I believe, the average Suffolk farmer along with the flour in the wheat that he grows sells offal in larger quantity than he buys, then he is interested in a high price for offal, because surely a high price for offal enables the merchant, or the miller who buys his wheat, to give more for the wheat than he would be able to give if he could only make a low price of the offal from that wheat?—He would buy the offal, because if offal was not at an artificial price I believe a great many would use double the quantity they do now.

39,440. Still, the farmer as a seller of wheat would lose by the lower price of his wheat more than he would gain by the cheapness of the offal that he would buy?—I do not think he would. I think the millers are doing such a trade now—the big millers at any rate—that that would not affect the price at all.

39,441. Do you think they would give us as much for our wheat if they had to take considerably less for the offal?—That might be; you may have it there; but I think the little increase that it would be to the miller would not be worth much consideration. I do not think he would alter his price much. I know perfectly well what you mean.

The Agricultural Holdings Act.

39,442. You know a great deal about the system of valuation in Suffolk. Should you say that during the great discussions which have taken place since the passing of the Agricultural Holdings Act more is allowed to an outgoing tenant now for manurial value on the farm than was allowed 20 years ago, we will say?—No, I do not think it has had any effect whatever. We very seldom disagreed 20 or 30 years ago about the price of manure. Strict inquiries were made as to what food had been used, but I do not think we ever had any dispute about the price of manure, and I do not think the practice has been at all in consequence of the Agricultural Holdings Act.

Manurial value.

39,443. I thought that the valuers had rather increased their scale of allowance?—No, I do not think they have. There was always a vast difference made between good, under cover, oil cake fed, manure, and what was simply stamped straw. We were always very strict in our inquiries as to what the manure was made of.

Shooting tenants.

39,444. (*Mr. Channing.*) You were speaking about the shooting tenants and saying that there was some discontent because they do not stop in the country and spend money there; has the system of having shooting tenants, instead of the landlords shooting on their own farms, led to a great amount of game being kept up?—When a landlord was in a position to do so he kept quite as much game, but a great many of them discharge their keepers before they let their shooting, I think, and then, since they have let it, I should think more game has been preserved again.

Ground game.

39,445. That is part of the complaint, then, that there are too many hares and rabbits?—No, I think there is very little complaint of that, because where the shooting is liable to be let there is almost always provision by a scale of damages against the over-preservation of game.

39,446. Do you think that is looked after?—I think so, if there is any great over-preservation.

39,447. I understood your evidence to be that when the landlords could make their own terms and have plenty of choice of tenants they were able to keep as much game as they liked?—Yes, they kept hares and pheasants.

39,448. And rather defied the Ground Game Act, or rather paid no attention to it?—I do not think the Ground Game Act has had much to do with it.

39,449. About your description of the condition of the land, does that equally apply to the light land as well as to the heavy land?—Of course good corn-producing land would have depreciated most. It is the fertility, I think, you are alluding to?

Mr. H. Biddell.
8 Feb. 1895.

Condition of Suffolk land.

39,450. Yes?—It is the good corn land that would have depreciated most, because the large sheep farms never were farmed very high, excepting those good portions of the land that lay around the house. There is no large farm without some good land on it, and of course that land is kept in a good condition of fertility by the sheep, and I do not think that has gone much out of fertility.

39,451. The value of that kind of land has not gone down so much as the heavy land, then; is that what you mean?—That has gone down, but I do not think the fertility still in the land is much affected by the large sheep farms. The question is not only its amount of fertility, but the state it is in; that is, what the grass is like.

Tenants' capital.

39,452. The tenants' capital has been very much reduced, I see you say in your brief?—They had capital enough years ago, in fact almost any farmer had; but the farmer has now held on to his farm so long, and he has been letting his capital go down very much, of course.

Beginning of the depression.

39,453. About what year do you think the depression began to get worse and to get severe?—I think 1874 was perhaps the highest and most prosperous season; then it began to go down, to 1879, and then we had a very bad harvest, you will remember, and a very wet year.

39,454. Is that about the time Suffolk began to get bad?—It began to go down very much after 1879.

Reductions of rent.

39,455. About what time did the reductions of rent begin?—There were no very great reductions of rent till after 1879, then in the eighties I think they gradually got down. I think people thought it was a temporary thing from 1875 to 1879, and I do not think there was much alteration made. Besides there were some good seasons just then.

39,456. Would you say that the impression that things would right themselves extended as far as 1885?—Yes, I think so, but 1879 crippled a good many. That was a very bad year so far as the corn was concerned; but even then—and I put off a farm that year because I was rather sick of it—I sold wheat at 52*s.* a quarter. So that then, bad as it was, it was nothing to such years as we have had lately.

Tenants' capital and reductions of rent.

39,457. (*Mr. Lambert.*) You say the farmers' capital has depreciated within the last 15 years very greatly?—Yes, but perhaps the "very greatly" would apply better to the last five or six years, or even later than that.

39,458. In what class of farms would it be that the farmers' capital has depreciated so much?—They would be the smaller farms, but the big farmers who have kept sheep and cattle and so on, I think have also let their rolling stock run down; I am speaking very much of the waggons and carts not being repaired. These things would have depreciated very much. Then the manure is another thing; they do not farm so high.

39,459. I want to know how much capital the farmers have lost, and on what farms have farmers lost most capital?—On the corn-growing farms which had no dairy and no sheep, from which they could get some sort of compensation.

39,460. So the farmers have lost a great amount of capital?—Very much so.

39,461. But where the farmers have been able to keep sheep they have not lost so much capital?—I should think not.

39,462. Could you give us an estimate, or a general rough idea, as to how much capital the farmers have lost during the last 15 years?—No, I should not like to hazard a guess at all; I know a great many of them have lost all they had.

39,463. They have lost all they had?—A great many.

39,464. Were they good industrious men?—Yes, I do not think anything was due to negligence.

39,465. Were they paying rent during that time?—Yes, they were paying rent during that time, and tithe.

39,466. Did they begin to lose capital before they had the rent reduced?—They may have done, but they have lost more capital since the reduction of rent has come than ever they did before.

39,467. But did they ever lose any capital before they had any reduction of rent?—Yes, I should think so.

39,468. If they had had a reduction of rent sooner, and if they had had that reduction of rent whilst they had been

Mr. H. Biddell.

8 Feb. 1895.

losing capital, of course they would not have lost so much?—Of course; when wheat was selling at 38*s.*, and barley making 34*s.*, if they had had a reduction of rent, the same as they have got now, they would have been able to go on.

39,469. And they would have been able to get on?—They would have been able to get on then, if they had the same reduction as they have had since.

39,470. But the reductions in rent have not been sufficient to prevent the farmer paying his rent out of capital?—No.

39,471. And many farmers have paid their rent out of capital?—A good many, where the landlord has chosen to make the market price of his land.

39,472. But you said in effect the landlord is able to make more than the market price of his land?—But he does not.

39,473. He has if the farmers had been paying rent out of capital?—I do not say that the landlords are not paying their expenses out of capital. These men, who have thousands of acres on hand, are not making money out of it; they simply hold the land to prevent it going out of cultivation. If once a farm goes out of cultivation it is unlettable.

39,474. I quite agree; still, if the farmers have been paying rent out of capital, that is a state of affairs which ought not to exist, and, to be fair between man and man, the landlord ought not to have charged that amount of rent which came out of the farmer's capital?—I do not know; I am afraid our business negotiations in this country are not carried on in that way of fellow-feeling. I am rather inclined, as an agent, to think that if I had said, "I think you had better let this man have some of "the money that belongs to you," that I should not be employed very much. I say, "Here is the market value; "do not take the farm unless you think you can do some-"thing with it; but if you do you must pay so much "rent."

39,475. I see; the landlord has endeavoured to get as much rent as he could?—Not to the utmost; but I do not think he has been enabled to support the farmer out of his own pocket; he has had children to keep and jointures to pay, and possibly he thought more of them than he did of the farmer.

39,476. And he took the rent whether the farmer paid rent out of his capital or not?—Yes; and when it was an up and down thing and there was a recovery I do not think the farmer complained of it.

39,477. Unfortunately lately he has not had the years in which he could recover?—There has been a most uniform depreciation in the value of farms; at least we seem to have no fluctuations lately.

39,478. Except a fluctuation in one direction?—Yes, that would be so.

Rates.

39,479. (*Mr. Dalton.*) I think you say that your highway rates have received a great deal of relief from the county council?—They even received relief before the county council was instituted, I think through Sir Massey Lopes. We have experienced relief in the highways very much.

39,480. You had a Government grant before the county councils were instituted, had you not?—Yes, and now the county council have taken over several roads; they have not only taken the main roads, but they have subsidised some others.

39,481. And the result is that the highway rates in your union have fallen very considerably, I suppose?—Yes, I think so. Some parishes that lay between one town and another have experienced great relief, because they have had main roads, and the county council have taken them entirely off the rates.

39,482. Your poor rate in the £ in the Woodbridge Union has gone down, I think?—I think it must have gone down. I think for one thing there has been a more strict examination into the applicants at the board. I think there is less outdoor relief given unnecessarily than there used to be.

39,483. And the result is that the rural rates have fallen considerably in the £ from those two causes?—They have fallen at any rate.

39,484. Your assessment is very much lower for agricultural land than it was previously, is it not?—Yes; the Chairman of the Commission read out some figures, which I take to be correct.

39,485. Then you must pay towards the rates a considerably smaller amount than you used to pay?—Yes; of course the school rate has added something to it, and that is a new rate—I say it is a new rate, although perhaps it is an old rate now.

Mr. H. Biddell.

8 Feb. 1895.

39,486. (*Mr. Little.*) I think you said that the farming interest began to decline from about 1874?—I may say it declined from that time.

39,487. About that time labour had increased in cost very much indeed, had it not; or from a little time before then?—Yes.

Labour.

39,488. And there was considerable difficulty in the eastern counties between the farmers and the labourers?—The institution of the labourers' unions, made some friction.

39,489. There was a lock-out?—Yes.

39,490. And the relations of farmer and labourer were considerably strained?—Yes, they were at one time.

Wages.

39,491. And the cost of labour increased very much did it not?—Not very much from that fact I think.

39,492. No, but about that time from high prices, and one cause and another, including the absorption of labour in other industries, there was a very considerable increase in the cost of labour?—Yes, when the prices were higher it was so.

39,493. If that increase of wages was not continued, at any rate there was no decrease for many years?—Not for several years.

39,494. The decline in the farmers' profits was not accompanied with a decline in the cost of labour?—No.

39,495. Not for some years?—The labourer shared in the improved prices long after the farmer had ceased to enjoy the prosperity.

39,496. Wages did not adjust themselves to the prices of produce at once?—No, they did not for some years.

39,497. Not until quite recently?—Not until quite recently.

39,498. Three or four years ago, should you say?—They went down perhaps a little before; I think you may put it quite recently; at any rate, they were not called upon to meet the farmers' losses.

39,499. And even now they represent in produce considerably more than they did 20 or 30 years ago?—Yes, if you compare them with the average price of wheat and barley, even now they are very much higher than ever they were.

39,500. You will remember perhaps when it was usual to base the weekly wages of the labourer on the price of wheat?—I never knew that adopted on a regular scale.

39,501. Not regularly, but broadly?—When corn went up, and flour was dear, there was always a good allowance made, and an extra price was paid for special work or something of that sort.

39,502. You will, no doubt, remember when a bushel and a half of wheat was considered a fair week's wages, or when some calculation of that kind was made?—I do not know that I ever knew a time when a bushel and a half was paid.

39,503. If there was not an exact ratio there was an approximate ratio between wages and the price of corn?—There was; we did reckon, 40 years ago, that the price of corn was what we should regulate the labour by.

39,504. And that has altogether ceased?—Yes; if we were to carry out the scale that we were on then the labourer would have little or nothing; he could not now subsist at all on what was then the scale that we adopted.

39,505. At the present time the effect upon the labourer, as I understand you, is not so much a direct reduction of wages as a reduction of employment?—Exactly so; there are more out of employment. Those that are in employ now, even at 10*s.* a week, if you take the present price of tea, and sugar, and lighting (that is to say, of oil), and flour, and everything else, are not so badly off now as they were a good many years ago.

39,506. But of late, I understand, the employment has considerably diminished?—Yes, there are more out of employ now.

Diminished employment, effect of.

39,507. And it must continue to diminish if the present prices are to continue?—There is not the money to employ them. It is not a question of what you would pay them. After the tenant has paid a rent, which he must always pay, which will secure payment of the land tax, insurance, and repairs—before the farm would be let at all you must do that—and after the tenant has taken out the tradesmen's bills, there is not money enough to pay the labourer, and so the tenant must do with less labour, or else he has

Mr. H. Biddell.

8 Feb. 1895.

not the money to carry on his establishment. Therefore, the tenant is doing with less labour.

39,508. And if he has to do with less labour he has to do with less cultivation?—It is so.

39,509. Which must narrow the area of cultivation?—He must narrow the extent of it; I do not mean in acreage, but he must do less per acre.

39,510. Does it not also affect the area of cultivation?—The corn land in the north of Suffolk, unless it is well drained and well sown with seeds, would hardly pay the rates.

39,511. Up to the present time there has been a certain amount of abandonment of land to rough grass, has there not?—Yes, and that has thrown the labourer out of employment who would otherwise have been employed in cultivating it.

39,512. And if present prices continue or if they should decline, that area must be extended?—That is so.

39,513. Therefore the employment must be contracted still more?—Yes.

39,514. And the people must go or starve?—Yes.

39,515. If the agricultural labourer goes, you say the tradesmen will go also and the little shopkeepers?—Yes.

39,516. If there is no cultivation and no payment of wages, there is nothing for anybody to look to?—No.

Low prices.

39,517. Would you say that if prices are to decline from the present prices that the inevitable result must be that large tracts of your county must be reduced to a state of non-cultivation?—Exactly so. It would be reduced to feeding ground of a very poor description.

39,518. And there would be depopulation?—Yes; there is no doubt about that.

Law of distraint.

39,519. I notice that in your brief you spoke of the law of distraint. What is your opinion upon the effect of the law of distraint?—There is this point in connexion with it: that if a landlord gives a falling tenant time to recover, hoping for better times, and he does not at once exact the rent that is owing to him, then if the tenant suddenly becomes a bankrupt through the intervention of other creditors, the landlord gets only half a year's rent; but if the landlord, finding that his tenant is going downhill, puts a distress in himself, then the landlord gets the full year's rent. Therefore an agent or a landlord is running a great hazard in letting a man go on; because somebody may make him a bankrupt, and then if you have not put in your distress before the bankruptcy petition is filed, you lose half a year's rent, because you can only claim for one-half year's rent; but if you put in the distress before he is made a bankrupt, you claim for the whole of the year's rent.

39,520. (*Mr. Clay.*) What does the creditor get?—At any rate, he gets a certain poundage in his debt, and the landlord does not; he could only claim a half-year's rent, and then of course he shares with the other creditors for the balance.

39,521. (*Mr. Little.*) You are not of opinion, then, that the law of distraint is injurious to the tenant farmers as a class?—Certainly not. I think it was less injurious to them a few years ago than it is now, because there has been a recent alteration of the Act within a very few years. There was a time when the landlord at any time could put in a distress for one year; I am not sure whether he could not do it for more; but that is now altered so that if the landlord does not put in a distress and the tenant is made a bankrupt, the landlord loses his claim for half a year's rent; and so he says, "I dare not let the man go longer, "somebody will make him a bankrupt and so I must put "a distress in."

39,522. Is that the law now?—That is as it stands now. I have an instance in point; I let a man go on trying to recover himself as I thought, and he suddenly became bankrupt, and I could only claim half a year's rent.

39,523. It has been alleged here that the law of distress induces the landlord to let the land to a man who is not a practical man, because he is secure of his rent; and that that increases the competition for farms?—I think that a man who is obliged to give six months' or a year's credit should be secure of it. If the tenant went and bought a sack of flour of a miller the miller could claim his money next week, or the next day, or if he bought anything else he could be made to pay for it; but no landlord could expect him to pay down his rent when he entered his farm. Therefore the law, or what is almost equal to it, universal custom, has given the landlord an advantage in that respect. If the tenant paid his rent in advance I do not see why the landlord could claim anything more, but then he is obliged to give credit which nobody else is obliged to do.

Mr. H. Biddell.

8 Feb. 1895.

39,524. The argument is that if the law was done away with the landlord would exact a fore-rent, and that would limit the competition, and so rents would be lowered?—Then the big men, those who have got money, think it would be something in favour of the little capital man. I think it is the little man we should encourage.

39,525. The abolition of the law would limit the number of men who rise from very small occupations to large ones?—Yes, it would be a hindrance to them. I believe the landlord's having the prior claim over other creditors has been the means of a great many getting into a larger business and getting on in life. That is my experience of it.

39,526. As long as agriculture was prosperous it was the men who began with a small holding, and gradually increased the size of their holding, who were the most successful men?—Yes, exactly so. I believe that has been the most successful course, that a man has gone from one farm to another with a little increase in size each time.

Cost of production.

39,527. Some questions were asked you about the cost of production, and I observe that it is put down in your brief that there has been an increased cost of production. You have not alleged an increased cost of production, but I presume you would say that the cost of production has not decreased in anything like the same degree as the value of the produce has?—Exactly so. The tradesmen's bill for shoeing, and our iron founders' bills for supplying us with ploughshares, have not been reduced at all, nor has the thatcher's bill, nor a good many others. We are now paying the same as we were when wheat was nearly double the price, and therefore you may call that in proportion an increased cost of production.

39,528. (*Viscount Cobham.*) Your artificial manures bill and your feeding stuffs bill are greatly reduced, are they not?—The artificial manures bill I suppose is, and certainly the feeding stuffs bill is.

39,529. (*Mr. Little.*) I only ask you the broad question: taking all the expenses of production there has been nothing like the same decrease in the cost that there has been in the value of the produce?—I think not. When we were paying more rent and more for everything we had more profit as tenant farmers than we have now.

39,530. We have been told here by a great political economist that if we doubled the price of all our produce the consequence would be that we should double the price of all our outgoings?—Indeed; that would be a very fine thing for those who surround us if it was so.

39,531. Is it your experience that things adjust themselves in that way?—Certainly not to any such extent as that, because I have known from experience of prices being more than double what they are now, but the expenses never were anything like double what they are now.

39,532. Is that not the cause of our suffering—that the price that we have to pay for producing goods does not adjust itself to the price that we receive?—Yes.

39,533. That is the secret?—It could not possibly do so, because you would starve the labourers out to begin with. If we paid, say, 12*s.* a week when corn was worth 42*s.* a quarter, and we were to reduce the labourers' wages in proportion to the reduction in the prices of corn, he could not live; he would hardly have anything. You cannot reduce the greatest item that we have in anyting like the proportion that our greatest product is reduced.

Payment of wages out of capital.

39,534. We were told, and no doubt it is a fact in which we should all agree, that the wage earners of this country, who are the largest part of the community, have profitted by the low prices. Is it not possible that wages have been paid out of capital?—They have, and those who congratulate themselves on being enabled to manufacture goods at low prices because their operatives can live at less, have accomplished that because the operatives have lived out of the capital of those who produced what they consumed.

39,535. In agriculture would you not consider that for some years past a considerable part of the wages have been paid out of capital?—Certainly they have.

39,536. You were asked if rent had not been paid out of capital; but is not the same true of wages?—Certainly it is, there is no doubt about it.

Engagement of farm servants.

39,537. (*Mr. Gilmour.*) Do you include the ordinary ploughman or horsekeeper, or whatever you may call him, under the heading of labourer?—It is compensated for in this way: All the horsemen come early in the morning, an hour before the others, to see after the horses, and they

Mr. H. Biddell.
8 Feb. 1895.

get from 1*s.* to 1*s.* 6*d.* and some of them 2*s.* a week in lieu of not having "taken" work, so their wages would stand at just about the same figures as the others do; they are paid a little more because they never leave any "taken" work.

39,538. Do you engage your ploughmen for a year, or how?—Only by the week.

39,539. They get weekly wages, then?—Yes, I have never discharged a man without giving him either a week's wages or a week's notice, and they leave you on the same principle.

39,540. They have to pay then for their own cottage; you do not get the cottage attached to your farm, do you?—Most farms have a certain number of cottages let with them; those cottages are mostly all on a three months' notice. I had eight cottages with the farm that I had hired of the Marquis of Bristol, but if I discharged a man, or he left me, I could not get him out of the cottage till I got or gave three months' notice; and I let him go if he found a better master at the three months' notice; some of them, indeed, went away without giving me that.

39,541. Do you have any difficulty in getting a man to fill his place at the present time even with this short notice?—No.

39,542. At a wage which I understand you to say is 14*s.* now?—It would not come to 14*s.* in Suffolk on the average. If I were to promise a man 14*s.* a week now, considering what things are, I could get any number of men to come, I have no doubt, because there are a great many out of employ, and it is not so much a question of the wages that you have to offer as the question of the advantage of being employed.

39,543. Then upon the reduced wages which you say now exist in Suffolk are the families of these people in as good a state as they were, are they brought up as well, are they as well clothed and as well fed as ever they were?—I should think so, but the actual labour that we get done is in inverse proportion to what we are paying per day. I remember farming when the day wages were only 16*d.* a day, and I have had more work done for 16*d.* a day than ever I had for 2*s.*, simply because the man was afraid, if he lost his place or if I complained of him, that there would be a quantity of men ready to take his place, and therefore he did his utmost to please his master.

39,544. (*Mr. Dalton.*) When was that?—That was in the years 1849 and 1850.

39,545. (*Mr. Gilmour.*) This system of short engagements, even with your men who are looking after your horses, I understand, has always obtained in your county?—I think so. Very few indeed in the county of Suffolk, I should think, have an engagement of anything over the week.

39,546. Have you many changes, as a rule, in the year?—Do you mean discharging a man and taking another on?

39,547. Yes; is there much of that goes on as a general rule on farms; are there many changes of farm servants?—No, as long as they can get work they have not left for several years.

39,548. What warning do you give those men before they leave?—Only a week, but unless a man leaves himself, or unless the farmer cannot pay him, there is very little discharging of men. There are very few men discharged simply because they do not suit. If a man gets into work with a farmer he very seldom leaves his employment, I think. I know a farmer that is lately deceased; in his will he left 10*l.* a piece to all those who had been at work on his farm for 20 years, and I think there are 20 of them. When I gave up I had several men who had been at work for me for over 30 years, and I have got one man now who has been at work 45 years for me and my brother.

Witness's experience of farming.

39,549. (*Mr. Clay.*) You seem to have begun farming in the most prosperous terms—about 1853?—I have been through some very good years; but previous to 1853 I farmed my father's farm when he was engaged in valuing, and so on. From 1847 to 1853 I was superintending my father's farm, and then I went into business for myself in 1853.

39,550. So you began really when prosperity began in in farming?—Yes; but I did not know all about farming in those very bad years which immediately succeeded the repeal of the Corn Laws. In 1849, 1850, and 1851, we had some very low prices then—as we thought.

39,551. As low as they are now, nearly?—No; double the price now.

39,552. Was barley not so low?—No.

Mr. H. Biddell.
8 Feb. 1895.

39,553. I mean barley and oats in 1851 and 1852?—No; I should think not. I do not think that barley was ever so low as it is now. You understand that I am taking the average of barley. This year there are barleys which have made 34*s.* a quarter; that is the best Burton barley; but then you would not find one sample in three barleys that would make it, and the rest of the barley would fetch 14*s.* a quarter, or 15*s.*, and so on.

39,554. When you gave up farming in 1892, did you find it an unprofitable business?—Very unprofitable indeed. I was much better engaged in farming for other people than I was in farming for myself.

39,555. You had no capital engaged in land agency?—No; when I withdrew from farming I withdrew the capital as well. Of course I had not any capital engaged in farming after 1892.

39,556. You would now say that you have been a very lucky man, in not farming since 1892?—I believe that I escaped the two worst years we have had in the century, so I think I ought to say so; but I think ill-luck hung to me before I gave up.

Future prospects of farming.

39,557. Do you see much prospect of more daylight and prosperity for the farmers yet?—I cannot say that I see it very distinctly.

39,558. Do you see any at all?—I can see no further into the future than other people; I am so far sanguine that I do not think the country is going to see with equanamity a great deal of land thrown right back into prairie state; I think something will be done, but I do not know how soon or how much. I know that most farmers are hiring farms now with the idea that things will be better, or they would not hire them.

Duty on barley.

39,559. You have not been able before this Commission to suggest that something, have you?—Only increasing the price. I should put a duty on barley in order to raise the price, that is all. I think if we put a duty on flour, we should be flooded with a good deal of feeding stuff for our cattle.

Land out of cultivation.

39,560. Is the land in Suffolk gradually going out of cultivation?—Yes, I think you may say that it is steadily doing so.

39,561. Can you give us the ratio?—There are not many farms given up in their entirety, but there are very many farms which have certain portions given up.

39,562. In the land which has gone out of cultivation what per-centage do you consider has depreciated in value?—It has not depreciated in value the more for going out of cultivation; it was the depreciation in value which made people throw it out of cultivation. It was worth nothing to cultivate before, and they have let it run to seed and natural produce.

39,563. But if land runs wild to seeds and weeds it certainly depreciates in value, does it not?—I did not quite understand the bearing of your question. If land once goes out of cultivation like that it is pretty well unlettable for several years, and you would have to let it for nothing; no man would hire land which has been out of cultivation and pay rent for it to render it fit for cultivation again unless he had a very long term.

39,564. What price per acre do you consider it would take to recover that land into its proper state of cultivation?—About 3*l.* an acre I should think.

39,565. (*Mr. Chaplin.*) Not more than that?—If you take 100 acres of land, and you have got to spend 300*l.* on it, that makes an impression on the man who is going to hire it. He does not snap at that kind of thing. I put it down at about 3*l.* or 4*l.* Mr. Clay will understand that this land which he is pointing to is not the best land, and therefore never was in such a state of fertility as the best land; it is the worst land that goes out of cultivation first, of course.

39,566. (*Mr. Clay.*) But you are talking about the recovery of land just as it was, good, bad, and indifferent?—Yes.

39,567. And you consider that it would take between 3*l.* and 4*l.* an acre?—Yes, between 3*l.* and 4*l.*; but it is a difficult thing really to estimate. A great deal of Suffolk is in sheep land round Thetford and Bury and that country, and that is almost going out of cultivation; there has been no great depreciation in the fertility of that, and so that and a great deal of heath land attached to better farms I cannot take into my 3*l.* or 4*l.* calculation.

39,568. Would you consider that that land which carried sheep and cattle has gone out of condition?—Not cattle.

Mr. H. Biddell.
8 Feb. 1895.

39,569. Well, sheep then?—That land has only been used to feed on so that can hardly be said to have depreciated in fertility.

39,570. So it has not gone out of condition?—I cannot say that it has.

The Agricultural Holdings Act. Manurial value.

39,571. You have given us some evidence with regard to compensation; may I ask what you allow for cakes and manures to an outgoing tenant as a general rule?—We have no tangible scale. We measure the manure up, and we ask what food it was fed with, and if it was fed under cover we ask how many cakes the beast had in the day, and we put on a certain proportion for it.

39,572. But the outgoing tenant must show receipts for, perhaps 10 or 20 tons of cake used, and the value of it?—No, we do not do that; we ask what per head did these beasts have; that is how it is made up.

39,573. Is that a satisfactory basis, do you think, to go upon?—It has been the custom, and I never heard it complained of, I do not see how else you are going to get at it. Every agreement that I ever signed in my life has had the condition that at the end of the tenancy all manure shall be laid up in heaps ready for the valuer to value, and then we value by the cubic yard.

39,574. Then, if 20 tons of cake were used with the sheep, and dropped on the land the manurial element would not come in at all?—Yes; if you are folding sheep you are allowed so much per score, according to what they had folded on the land, but where the sheep are fed off turnips and have been fed with cake, in that case the farmer has had a crop since, you know.

39,575. Have you studied Sir John Lawes on exhausted cake?—I do not know that I have very much. I have a general idea that he puts a value on everything in that way.

39,376. You, a land agent, and you have not looked into these matters?—I have looked into a great many matters as a land agent for a good many years, but I am not very sure that Sir John Lawes ever helped me in my Suffolk covenants.

39,577-8. Is he not an authority on agriculture?—I do not admit that he is an authority, but I admit that he is considered so. Take one thing: do you think this as a farmer? Ido not know what you are, but this I know, that they teli me that the value of a ton of manure from cotton cake is as much as the value of a ton of best linseed cake. Now I shall have to farm for 50 years more before I believe that, although Dr. Voelker says so.

39,579. As regards the chemical formation of oil cake and cotton cake, is there not more nitrogen—I am asking you this upon scientific information—in cotton cake than what there is in linseed cake?—I am not up in that; I only go by the amount of turnips or wheat contained in the manure that it makes, that is the calculation I have always gone on, simply by experience and weighing the results after the use of these things. I do not know anything about the chemical constitution of these things. I have bought the manure for hundreds of acres, I was going to say, and I have weighed the results side by side, and I think that is a far better thing than going to Sir John Lawes.

39,580. If you do not know the chemical ingredients—the nitrogen, oil, and other things—of these cakes, of course I will not pursue the question?—I do not, and you may take it for granted that I am not up in the scientific phase of the question you are going into.

39,581. I am not a scientific man myself; I am a practical man like you; but at the same time these things require some looking into, and some attention should be given to them?—I am so impressed with this in these experiments, that they never made an experiment themselves in weighing crops, and I would rather take my experience than I would take the theory they have been talking of.

39,582. Yours is a rough-and-ready way of doing it?—And a very practical one.

39,583. Practice sometimes requires science to guide it?—Yes; only my knowledge comes of 40 years' experience, and the science they are talking about comes with a few years' study.

39,584. I think Sir John Lawes would be a little older than you are, and he has been at it all his life, so it is not a question of 40 years even with Sir John Lawes; you are the first I ever heard who disputed Sir John Lawes?—I have a great respect for his authority on the experiments he has made, and I think there are a good many still making experiments who have never read his, but I do not go into the chemical question at all; I am not up in it.

39,585. When an outgoing tenant makes old grass with a liberal use of cake do you allow him anything for the increased fertility of his land?—I am sorry to say there would be very little cake.

Mr. H. Biddell.
8 Feb. 1895.

Compensation for increased fertility.

39,586. I am only saying if it was used, would you allow him anything for the increased fertility, for making that old grass and leaving it?—I do not know whether he would be allowed anything; I think that is a question between him and his landlord. The incoming tenant would hire the farm as it is, and I do not think that he would like to be called upon to pay for any cakes which had made the meadows in the state they were when he looked at them.

39,587. It is a question whether he would like to have the outgoing tenant leave the farm in poverty or in good condition—which would you prefer?—As a landlord I should like to have him leave it in good condition, but I think he would leave it in the condition which left him money by the farming of it, and that if it left him most money by the farming of it as you describe, that is how he would leave it. In all probability he would not farm so high the year that he left; I should think not.

39,588. The question has been raised before this Commission: Do you allow an outgoing tenant anything for using his home-grown corn?—I told you we allowed it in the very estimation of the price per cubic yard of muck.

39,589. But his home-grown corn may have gone into sheep?—Very well, what would you charge him for then? I do not understand because if he fed his sheep with cake and the roots grown the previous year he would have got that out of the barley.

39,590. Would he get it out of the barley; would he get all the unexhausted value?—If he was going to leave he would not farm it so high probably.

39,591. We want to give this Agricultural Holdings Act a good sound position to enable the tenant farmer to leave the land in a good condition without leaving poverty; is that not a good sound principle?—Yes, I suppose it is, but do you think the incoming tenant would be always pleased at paying for the increased fertility. He hires a farm as it is, when he goes and looks over it, he sees whether it has been well farmed or not and hires it accordingly.

39,592. Then it is not the incoming tenant but it is the landlord who gets the increased value?—Theoretically and legally, it is, but practically it is the incoming tenant, I think.

39,593. Does the incoming tenant not value the farm when he goes and sees the condition that it is in, and offers a rent accordingly?—Yes.

39,594. And he gives a larger rent for a farm in good condition than for one in bad condition, does he not?—Yes.

39,595. Does that not go into the landlord's pocket?—Yes, it does; but that is not done during the last year.

39,596. During the last three or four years, then?—If you are going to value, and to make the incoming tenant pay for the value, and all that has been put into it for two or three years before, of which the outgoing tenant has had much of the benefit, he would at once refuse your farm; he would not hire it in the county of Suffolk; I know he would not. If you tell an incoming tenant in the county of Suffolk, who is going to hire a farm, that he has to pay the increased fertility which the outgoing tenant has put in for two or three years, then he would say, "You had "better farm the land yourself."

39,597. The Agricultural Holdings Act says the landlord should compensate the outgoing tenant?—We do not believe in the Agricultural Holdings Act in the county of Suffolk, and I tell you that with a very large practice. I do not want to come here and tell you that I have such a very large practice, but that practice has given me this result, that I have never met with an outgoing tenant giving way to an incoming tenant who has ever been under the Agricultural Holdings Act; I have never met with a case where the Act hast been put into practice. That will tell you how much they appreciate this fertility.

39,598. Is it not the fact that the only contracting party with the outgoing tenant is the landlord—it is not the incoming tenant?—I entirely agree with you that it is so, but I never heard either the landlord or the tenant wish for it in the county of Suffolk.

The law of distraint.

39,599. You have been asked by Mr. Little about the law of distraint; before the repeal of that law what was the extent of the landlord's right—how many years could he distrain for under the old law?—I think he could distrain for a year's rent.

Mr. H. Biddell. 8 Feb. 1895.

39,600. Was it not for six years' rent?—No.

39,601. (*Mr. Little.*) "Was," the Commissioner said?—I am speaking about a recent alteration in the Bankruptcy Act.

39,602. (*Mr. Clay.*) I am asking you what it was under the old law of distraint in England; was it not six years?—I do not know. Fortunately I never had a case of distraint come under my notice until recent years, so I cannot say.

39,603. You said on that point that the tenant now having the law of distraint gets a loan of the money from the landlord for nothing?—Yes.

39,604. If he buys an article on credit does he not pay more money for it than if he gives ready money for it?—Certainly, because the seller has got no security for it whatever.

39,605. Does the landlord not get more for letting a tenant go on for 12 months before he asks for the rent than he would get if he asked for it when the tenant entered the farm?—I never heard of a man paying a rent in advance, and I do not know whether anybody would do it. It is no use my talking about what would take place in such a case, for I have never met with a case where a landlord asked for a rent to be paid in advance, or where a tenant was willing to pay it. It always has been the custom that the tenant does not pay his first rent till the April after the October in which he has got into the farm.

39,606. You said that the landlord gave the tenant the loan of the money without any interest?—So he does.

39,607. Would not the increase of rent that he got for that loan include both interest and capital?—No, I do not think there would be any difference. I do not know anybody that would hire a farm and pay the rent down. I never met with a case where a man offered to do it, or where the landlord asked him.

39,608. Are the tenants of Suffolk men of business; do they pay as much for an article for ready money, as when they buy on credit?—No, the Suffolk farmers get something by paying down ready money I have no doubt.

39,609. If a man took a farm at ready money entering on Whitsun-day, which is our term, would he pay the same rent for a farm?—He will not do it at all; he will not hire a farm subject to paying a rent in advance, I never met with a man who would do it. It is no use my trying to reply to the question which you put when I never met with an instance.

39,610. But I am telling you what is our experience in Scotland?—I do not know what you Scotch people do. I dare say you do things in a business like way. I am only speaking about the county of Suffolk, and I never met with a man who would go and hire a farm if he was asked to pay the rent down first. If you said you were going in for such a custom they would say, "I will have nothing to "do with it," they would indeed.

39,611. If he was buying an estate for which he had to pay on the day of the auction, would he pay the same price for the estate as if he were given 12 months' credit?—If what?

39,612. If a man was offering an estate for sale, and saying that the money was to be paid down on the day of the sale, would the buyer pay as much for that estate as he would if he had to pay 12 months after?—I should think not. I do not know who would buy an estate like that.

Land out of cultivation.

39,613. (*Chairman.*) When you speak of land going out of cultivation, I suppose you do not include land which has been laid down in grass either permanently or temporarily, do you?—Some land is allowed to go out of cultivation and produce its own grass; that is simply ploughed, and not ploughed again. If it is a little better land, it would be ploughed and there would be a little grass sown on it. I call both those cases going out of cultivation—I do not call it going out of occupation.

39,614. Has much land been laid down to temporary grasses?—No. I did do that myself a good deal in my own occupation; but there is one great objection to it, that if you lay down grass temporarily, with the best rye grass and things that will keep five or six years, when you take that up again that is invariably foul with twitch or something, and you must make a regular fallow of it. That makes people shy of laying it down for a year or two. If it is laid down permanently, presently that spear grass will die away, and if it is good land you get a better grass.

Land laid down to grass.

39,615. Has much grass been laid down in permanent grass in your county?—A good deal, lately, has—these two years; that is to say, tolerably good "Sutton" seeds. I have laid down several farms this year. The farms that I have let have been let with the undertaking that the landlord finds the seeds for a certain amount of grass, with the proviso that that land is not to be mown for two years or perhaps for three years; so that is being laid down to grass.

Mr. H. Biddell. 8 Feb. 1895.

39,616. Will the land in that district stand that well; does it come to any value after that?—Yes, it would if it is fed with cattle after a time more or less according to the quality of the land. Suffolk, I should tell you is not a good grass county. We get such a dry cold spring.

39,617. As I understand you, if you lay down your grass and feed it with cattle, fair grass would grow?—In some number of years, but it takes some years.

39,618. (*Mr. Chaplin.*) I suppose you mean giving them something in addition to the grass, giving them cake too?—Yes, I do not think simply the grass would do.

39,619. (*Chairman.*) Of course giving them cake, you must feed them too, in order to improve the land, but where that has been done, does the land come to any value?—Yes.

39,620. What is it worth an acre then, when it has been fairly dealt with for a few years, what value does it come to?—It depends upon what it is underneath, or what soil it is.

39,621. Take a fair average case?—It would never in that case be let away from the farm. It would have to be all in the farm. I cannot tell you exactly what that land would be worth; it would be worth nothing by itself. It would be only done to assist the other part of the farm.

39,622. Supposing a farm is well provided with land of that kind, does it add much to its value?—Land that produces a fair amount of grass even, which would go on with a little fair feeding, is just so much in advance of the other that it is farmed without labour.

39,623. Now supposing there is a farm of 200 acres with 60 or 70 acres of this kind of grass, is that lettable. Can you get a fair rent for it?—70 acres on 200 would be a large proportion of grass in Suffolk.

39,624. Would a farm in that condition let well?—It would not let well now, but it would be more lettable than if it had not that grass.

39,625. What additional value would be given to it?—I cannot give you that at all.

39,626. You say that what is important to ascertain is what improvement can be effected by the judicious outlay of capital in the way of laying down in grass, you have told us of the worst of things so far, but one is anxious to look at the future?—This very thing you are pointing out we are adopting.

39,627. What can be done? What improvement can be effected by the outlay of capital?—We certainly think we are improving the letting value of the land by letting the land down to grass, but I cannot tell you that it is so much per acre. I could make a guess the same as anybody else, but it would be perfectly useless.

39,628. (*Mr. Chaplin.*) How many cases could you find of farms where you could get 70 acres out of 200 that were adapted for the purpose of being laid down in this way; is it not a very large proportion?—Yes, but I think that if the landlords would find the seeds, and the tenant were to feed the land well, most farms would be improved in value by it.

39,629. Certainly improved in value, but would it pay to go through this process at the present time?—It just pays in this way; that unless you lay down so much, you cannot get a tenant at all. A tenant will not come to it unless there is some pasture. Therefore I say the landlord will find the seeds if the tenant undertakes to feed it fairly, and then we can get a tenant at some price, but it is done to ensure getting a tenant.

39,630. (*Chairman.*) The mere promise makes a difference between letting a farm, and not letting it?—The undertaking.

39,631. Where it has been done for a few years it must *a fortiori* add still more to the value?—Yes.

39,632. Has a good deal been done in that way?—A good deal. I believe it is a very common thing now to undertake to lay certain acreages down to grass when you let a farm.

Wages.

39,633. You were speaking just now of your recollecting wages at a time when wages were sixteen pence a day?—In 1849, and 1850, I perfectly well recollect making a ready reckoner for calculating the wages up at one and fourpence a day, when I settled with the people on Fri-

Mr. H. Biddell.

8 Feb. 1895.

days. It did not hold to that very long, but it got down to that.

39,634. How long did it last?—I should think not a year.

39,635. Was that the lowest point?—That was the lowest point, but eighteenpence they kept to for a long while, but then that was very much supplemented by "taken" work in the parish, and so on.

39,636. The parish relief went in aid, do you mean?—Not parish relief, but the farmers gave them brushings, and wood, and occasionally put work out to them. They were very ready to work then.

39,637. (*Mr. Little.*) In the fen part of Suffolk, the wages at one time went down to seven shillings a week, did they not?—I understood that they did, but at that time I only knew what was going on in my own immediate neighbourhood. At the same time, however, that I was paying for my father sixteen pence a day, I was perpetually asked to take on labourers, week after week at the wages that I was paying.

Diminished employment.

39,638. (*Mr. Chaplin.*) You have given so much evidence in your examination in chief, that I only want to ask you one or two questions. There is plenty of work that ought to be done, and waiting to be done, you say, in Suffolk?—Yes.

39,639. But the farmers cannot afford to pay for it?—That is so, they can do without this temporarily; they can let their grass increase, instead of having all their stubbles looked over with a fork directly after a harvest, and that kind of thing.

39,640. That is in consequence of their getting such small returns they have not the money?—They have not the money, and they must stop paying something.

39,641. If they had better prices and more money, there would be a great many more labourers employed in this very necessary work than there are now?—I can give you the evidence. One of the Marquis of Bristol's tenants had a man I had employed all the winter in my garden, and he gave him a harvest, and he said if things were to be as they were five years ago, he would put on five extra labourers after harvest. He is one of the Marquis of Bristol's large tenants, farming 300 acres, and he said, "I "would put on five men now if I had the money coming "out of my stacks to pay them."

Land out of cultivation.

39,642. I understand you also to say that, if there is any further fall in prices, it can only end in a great deal more land going out of cultivation, and more labourers being turned out of employment?—Yes; and not only land going out of cultivation, but the land will go out of occupation then. There will be a good deal of land going out of occupation now. There is a great deal of confusion between the two things. A man may have a farm, and let it go out of cultivation, and he may throw it up, and the landlord would not be able to find a tenant. We have some of that thing in Suffolk.

Land laid down to grass.

39,643. With regard to the suggestion that you have made, that land is being laid down, to a certain extent, in grass, and the further suggestion that has been made to you, that that system might be increased and developed with advantage; even if it was successful, I suppose that also means more labourers out of employment?—It does, every acre of it, every field. That is the great inducement, that the labour bill would be decreased, and the farmer would not have so much to pay on Friday night.

39,644. The inducement to do this is to lessen the amount of labour?—It is the sole inducement.

39,645. So that in one sense, although the position of the farmer might be improved, one of the great difficulties in the case of agricultural depression, namely, the loss of employment to the labourer, would be so much increased?—Yes, and to a very serious extent.

Future prospects for farming.

39,646. Did I hear you aright to say this, that nothing but an improvement in prices could possibly keep the land in cultivation?—Yes, that is my impression as regards a good deal of the corn-growing land in Suffolk.

39,647. And that farmers were still holding on, because they hoped and believed that something would be done?—Yes.

39,648. What do they expect to be done?—I do not know; they think something would be done. I had better express it in this way: they think something would turn up—that prices would improve; but I am not very sure whether they are sanguine about anything being done.

39,649. Do you mean that they are rather in the position of Mr. Micawber—waiting for something to be done?—Quite so; they are waiting for something to turn up; I think that is the expression.

Mr. H. Biddell.

8 Feb. 1895.

39,650. They are keeping on on the mere hope of this?—There is many a farm in Suffolk of which the landlord dare not terminate the tenancy, because if he did, he would have to farm it himself, and he has not the money to stock it; and if the tenant went out, the landlord would claim all for arrears of rent, so they keep on sliding, and the man simply is not enabled to pay rent, but he holds the farm to prevent the farm going out of cultivation. I know several farms held like that.

Rise in prices.

39,651. But unless there is a rise in prices, all this, sooner or later, must come to an end?—Exactly; there must be an end of this kind of thing. It is not a palliation of circumstances to keep it up, but it points to a crisis.

39,652. And when the crisis comes, that crisis means, I gather from your evidence, that the land would be totally uncultivated?—Totally unoccupied.

39,653. There will be a general smash?—There will be a general smash, and the smash will come hardest on the labouring man, I am afraid.

Duty on barley.

39,654. You mentioned, I think, the question of barley, and you said that that was the great staple product of the county of Suffolk?—If you go to the northern part, I do not know whether you know the district, but we will say from Framlingham to Harleston, and from there round to Stradbroke and back to Eye, there is a very large flat county which is a fine barley land; that land will go out of cultivation unless you can increase the price of barley or wheat.

39,655. If by any means the price of barley could be improved, what would be the effect on the county of Suffolk and particularly upon the labourers in that county?—It would be kept in cultivation, and there would be more horse labour used, and there would be more hand labour, and there would be more bills to pay for harness making and the repairing of implements. It would be for the general good of the whole locality, provided it was an agricultural locality.

39,656. Would you be justified in saying to this Commission that if there was any substantial improvement in the price of barley one of the chief effects would be to keep the labourers of the county employed?—I have no hesitation in saying that you put it exactly as it would be—that if you could make the price of barley so that it would pay to keep the land in cultivation you would have the labourer employed.

39,657. Have you ever considered how it could be improved, and have the farmers or agriculturists in your county ever considered this question?—Considered it? They know about it. They know perfectly well that if they could get more money for the barley they would go on with the cultivation of their farms.

39,658. What I mean is have they got any proposals to make which would improve the price of barley or increase it?—They point to a duty on barley.

39,659. Is that what they want?—Stop this Danish barley from coming in. I wonder the teetotallers do not join us in taking it off tea and putting it on barley.

39,660. What you advocate is a duty on foreign barley?—Yes, and on malting substances which would be used for the brewing of beer.

39,661. You advocate a duty upon all foreign substances which are used now for the making of beer?—Yes.

39,662. And if that were done do you think it would have an important effect on the general agricultural condition of the county of Suffolk? Is that what I am to understand?—I feel sure that it would.

39,663. Is that one of the principal recommendations you have to make to this Commission?—I think that is the recommendation least liable to objection.

39,664. Is it the recommendation that chiefly finds favour in your county?—It would find favour in nine cases out of ten if they thought there was any probability of its being done; but they say "We shall never get it." That is the argument; they do not doubt the result if they could get it.

39,665. Upon its merits if they thought there was any opportunity of getting it that would be a demand universally pressed by the agriculturists of Suffolk?—Universally; every farmer would say so. He would not wish to tax the food of the people, but we did not think there was that great objection to taxing the drink of the people.

Mr. H. Biddell.
8 Feb. 1895.

39,666. Do you think that demand would find favour in other counties too?—I do not know other barley-growing counties of course; in Lincolnshire it might.

39,667. Would it be popular with the rural labourers?—The most unpopular thing with the labourer is being out of work.

39,668. And inasmuch as this would provide him with work he would be sure to be in favour of it?—He would be in favour of it.

Butter factories.

39,669. You said something about butter factories, on which I wanted to ask you just one or two questions. I rather gathered that you thought that under certain conditions there might be a considerable opening for agriculturists in better arrangements for making and for selling their butter?—Yes. Our great difficulty is that we sell it in such small quantities that it is not worth the notice of the large buyers.

39,670. Your difficulty is this, I understand: that in the case of a farmer conducting this business alone it is impossible for him to provide a constant supply and a regular supply of butter sufficient to induce the big merchants to buy it?—That is so; the big merchants tell us so. They say, "If you can produce me a thousand pounds a week, all of one substance I will enter into business with you;" and then that would be a serious competition against this foreign butter.

39,671. If you, for instance, were able to provide the merchant in London with a constant and regular supply of good butter of a certain quality there would be no difficulty whatever in selling it?—I should think not.

39,672. But that is beyond the power of an individual farmer?—No one man can do it.

39,673. Then you propose in order to get over that difficulty that there should be bu actories established?—Yes.

39,674. And you suggest that Government aid should be given for this purpose?—I think unless the Government does it no one else will.

39,675. Who are they to give it to?—The money?

39,676. Yes?—They must put it in trustees' hands I suppose.

39,677. Are the Government to start butter factories themselves, or what is it that you contemplate?—The Government would be the butter manufacturer; I do not know anybody else; it would be like a man doing it himself if he simply gave security to the Government that they should have the money back. He could do that without going to the Government.

39,678. What I want to arrive at is this. Do you see any possibility of associations being established in counties like Suffolk for the purpose of establishing butter factories which could be conducted with the aid of Government support?—Do you mean that the Government would lend the money on a certain security?

39,679. Yes?—I do not think they would enter into that; I am afraid not.

39,680. Then do you look for the establishment of butter factories entirely to the unaided efforts of the Government alone?—I do not see how it is to be done without. If you go to the farmers they have got no money to subscribe for a thing like that.

39,681. They are too far gone in Suffolk?—They are too far gone.

39,682. There is no money left to help themselves?—No, but I believe the thing would do well, and that something might be done with it.

Mr. R. Biddell.
8 Feb. 1895.

39,683. Are you aware that experiments of that sort have been tried in other counties?—No, I do not know the particulars of any; in fact I do not know about there being any.

Beetroot cultivation.

39,684. One question with regard to the sugar-beet, and the growing of that in Suffolk; have you had any practical experience of growing sugar-beet yourself?—Only from minutely watching my brother William Biddell, who grew it very largely. I think he always took 700*l.* or 800*l.* annually out of his beet at Lavenham.

39,685. Did he grow it with success?—He did; and I can give you the name of a gentleman who farms largely in Suffolk, who told me that a certain off-hand farm within four miles of Lavenham paid him 10 per cent. on the capital employed when he grew sugar-beet.

39,686. Had he a factory?—No he supplied the Lavenham factories.

39,687. Are they still in existence?—The building is but it has been closed for seven years, I should think.

39,688. Why was it closed?—My idea is that the beet which he got did not yield sugar enough to pay the manufacturer to go on. It was done by a Mr. Duncan, a Glasgow man, or at least a man from the neighbourhood of Glasgow, who had unlimited capital and unlimited energy. He would have made it pay if it could pay.

39,689. Was that owing to conditions of climate?—I should think so, but then I am not sure. I do not know whether sugar has got up in price, but if sugar had been at a certain price it would have paid, because they did get get saccharine matter out of the beet, no doubt.

39,690. Given that the conditions of price were the same here as in the countries which compete with us, are you able to tell the Commission that in your opinion as far as climate and soil and local circumstances are concerned we could grow sugar-beet either in Suffolk or in other parts of this country with a fair chance of success in competition with foreigners?—I know all about it except the manufacturing parts, and there I should not be able to tell you whether it would pay. I know we could grow it, and the farmers there would be glad to grow it, and to supply him with it at the price he used to pay.

39,691. I rather gathered from you that the foreigners who compete with us have the advantage in point of climate and of sun, which is very important?—I should think they have, and not only that, but have they not export bounties?

39,692. Yes?—Of course that would militate very much against the English manufacturer.

39,693. But apart from the question of bounties, if we were on even terms in that respect, do you think that the climate and conditions of this country would enable us to compete successfully?—No, I think our climate and conditions are not equal to those on the Continent from what I have heard, but still I am only giving you my opinion from what I think; it is not from knowledge.

The depression in Suffolk.

39,694. The general effect of your evidence I think, comes to this; that the effects of the depression in Suffolk are deplorable in almost every condition in life?—I think it is much worse than there is any appearance of outside. I think there is a good deal more mischief quietly going on than any body is aware of. The bankers know about it, and the agents, and landlords too.

39,695. But you see no hope of any improvement whatever except in an increase of prices?—That is quite my conclusion, and I have considered it in all its bearings.

The witness withdrew.

Mr. John Treadwell called and examined.

Mr. J. Treadwell.

39,696. (*Chairman.*) You reside at Upper Winchenden, near Aylesbury?—Yes.

Particulars of witness's farm.

39,697. I believe you and your son together farm a farm of a little over 900 acres on the estate of Baron de Rothschild?—Yes.

39,698. Of which two-thirds is grass land?—Yes.

39,699. You also farm 200 acres under another landlord about three miles off?—Yes.

39,700. That second farm is half arable and half grass, is it not?—Yes.

39,701. And apparently has just been sold, and you have not yet come to an arrangement with the n ew landlord?—Not at present.

39,702. Your off-farm of 200 acres was purchased a few years ago for 13,000*l.* for occupation, was it not?—Yes.

39,703. Then the owner died, and it was sold for 6,000*l.* or a little more?—Yes.

Rent.

39,704. And you now rent it at about 300*l.* a year?—Yes.

39,705. And you have been receiving 10 per cent. back, but you have now given notice for a further reduction?—

Mr. J. Treadwell.
8 Feb 1895.

Yes, and unless I get a considerable one I shall not keep it; in fact, I do not care whether I occupy it or not.

39,706. How long have you held this farm under Baron Rothschild?—Ever since the Baron bought the estate. I was a tenant under the Duke of Marlborough. I myself have been a tenant there since 1850, and my father was tenant there since 1841, when it was part of the Duke of Marlborough's estate.

Reductions of rent.

39,707. What rent do you pay to the Baron de Rothschild?—My present fixed rent is 1,344*l.* 2*s.*, but with a 20 per cent. abatement the last two years (268*l.* 16*s.*) I am now paying 1,075*l.* 6*s.*

39,708. What did you begin at a few years ago?—I have increased my occupation from time to time previously to the Baron buying the estate, and also since. I have added little by little to it. Then I took this other farm where my son lives, some four or five years ago.

39,709. How much per acre were you paying originally?—Originally I should think I paid about 46*s.* for my home farm before I had the others. I then had only 420 acres, now I have about 940 acres under the Baron.

39,710. What is it reduced to now?—For the two farms together I pay about 1,200*l.* a year.

39,711. How much would that work out per acre?—It would be less than 30*s.*

39,712. And you are still paying 30*s.*?—It is less than 30*s.* taking the whole lot.

39,713. You say you have added to it from time to time?—Yes; when I first took the farm where I am now it was about 400 acres; when the Baron bought the estate he added bit by bit to it, and then presently he took some away. Then another farm fell out adjoining in 1887; they offered me that for my son, and I took it, and we worked the two farms together at a much lower rent. We had two reductions of rent, 15 per cent. first and then an additional 15 per cent. after that, and when I took this other farm we made arrangements for that to be the permanent rent, which amounted to about 27½ per cent. off the original rent; but since then, for two years, I have had 20 per cent. off that.

39,714. Have those been permanent reductions of rent, or only abatements?—That is a permanent reduction up to the last reduction, but this 20 per cent. is only an abatement.

39,715. It is rather a complicated arrangement, but as I understand it, you began by paying 46*s.* an acre, and you have now come down to about 26*s.* 8*d.*?—Yes.

39,716. And in the last two years you have had abatements on that of 20 per cent. That is it, is it not?—It would be altogether a little less than 23*s.* per acre I should think with the last 20 per cent. off, but my son's farm is at a much lower rent than my home farm.

39,717. After you have deducted the 20 per cent.?—Yes.

39,718. The last addition you made to the farm I see was about four years ago?—In 1887.

39,719. Then you took 400 acres more?—Yes, but that was not so good land as what I had been previously occupying.

39,720. Did you do pretty well upon the land until late years?—Yes, I have done very well.

Witness's experience of farming. Sheep breeding.

39,721. When did you begin to turn the corner, and do badly?—In 1879. But I must tell you that I have a specialty which puts me in a better position than many people. I am a tup breeder, and have made a large amount of money out of my sheep, which any ordinary farmer could not make.

39,722. How was that?—When I can sell, as I have done, 60 or 70 sheep at from 15*l.* to 25*l.* apiece, that makes a great deal of difference.

39,723. Then you breed sheep of great value?—Yes.

39,724. That shows that you make something out of your talent, I suppose?—I do not know; I have been fortunate.

39,725. It is something more than fortune, I suppose, which has enabled you to do well?—Yes.

39,726. (*Viscount Cobham.*) What is the best price you have got for a ram?—Last year in the bad times I had one that made 150 guineas. That was a record price; that went to Scotland.

39,727. (*Mr Clay.*) Those were Oxford, were they not?—Yes.

39,728. (*Chairman.*) I suppose even since 1879 you have made it pay?—I have got some figures here which show that notwithstanding having this specialty I have been losing a lot of money this last four years.

Mr. J. Treadwell.
8 Feb. 1895

Bad seasons.

39,729. How far is that due to the bad seasons as compared with the low prices?—Partly from the bad seasons, but more particularly from the low prices. We had a very bad season for drought in 1893, which made a great deal of difference, but then we had a good corn year. Then last year, 1894, we had a good season with our grass land, and also a very large corn crop.

39,730. But in 1893 there was a great drought, there was no food for your sheep and cattle I suppose, and the price went down very low on account of the want of stock, did it not?—It was not so much that, but we were obliged to be at such an expense to feed our cattle in the winter of 1890 and 1894 that that took back a good deal of our money and we could not keep so much stock.

39,731. Was that a cause of loss to you?—Yes.

Prices of sheep.

39,732. Did your own sheep keep up in price on account of the specialty or not?—In the seasons of 1892 and 1893 the prices were very much reduced, and my average fell from 21*l.* in 1891 to 13*l.* and 12*l.* in 1892 and 1893, but in 1894 it rose to 17*l.* in consequence of having this extraordinary price for that sheep which made a good bit of difference, and then I had an extra good lot of sheep too.

39,733. Last year there was a rise in the price of sheep I suppose due largely to the scarcity of them?—Yes I, think so.

39,734. There has been a re-action in fact?—Yes.

39,735. Then in the case of sheep, there is nothing to complain of much now in the matter of price?—Only we have not got enough of them to sell.

Valuation of stock.

39,736. That is the result of the previous bad year, I suppose?—Yes. I might say that I always take a valuation every year of my live stock on the farm, and of the hay and corn I have left. On the 25th March 1891, my valuation came to 11,204*l.* 1*s.*, and that has been gradually reduced to 7,900*l.* 5*s.*, on the 25th March 1894; so that I must have lost an immense amount of capital during the last four years.

39,737. Have you the same amount of stock yet?—Pretty much so, but sometimes when we get short of money we sell stock to make the money, and then we have not quite so much stock on the farm. But I have a very good stock on the farm yet.

39,738. Do you put into this valuation the high value of your specialty?—I may take a little, but it is taken at as much one year as another; I do not take the extreme value.

39,739. Do you grow any corn?—Yes.

Receipts, 1891-4.

39,740. What do you grow, wheat?—Something of everything, wheats, oats, barley, beans. I can give you figures showing my receipts from all sources during the last four years. In 1891 they were 10,686*l.*; in 1892, 10,538*l.*; in 1893, 8,418*l.*; in 1894, 7,738*l.* You see the reduction in my receipts has been enormous in the four years.

39,741. (*Mr. Little.*) Have you got your expenses for the same time?—No, but the expenses have not decreased in the same way.

39,742. Still, you have not got the figures?—No, I have not.

39,743. Is that in addition to the decrease in the value of the stock in hand?—Yes, exactly.

39,744. (*Chairman.*) Then a part of this decrease in 1893 and 1894, at all events, was due to bad seasons?—Not in 1894, I will not say that. In 1893 there might be some amount, there was undoubtedly, but my corn was better in 1893 than many other people's was. On the Chiltern Hills in our county they had really nothing.

39,745. Is yours in the valley?—No, I lay on the hill pretty much, sloping down from the hill, but it is pretty good land, and pretty well done.

Consumption of corn and cake, 1891-4.

39,746. Your good farming saved you in that year, I suppose, to some extent at all events?—I think so. In connexion with that I may say that I consume an immense deal of corn and cake on my holding. I have the figures here which I paid for corn and cake bought in the last four or five years, and also what I have used of my own growth.

39,747. Will you just state those figures?—What I bought in 1891 was worth 2,453*l.*; in 1892, 2,942*l.*; in

Mr. J. Treadwell. Feb. 1895.

1893, 2,421*l.*; and in 1894, 1,858*l.* I used of my own growth in 1891 981*l.* worth; in 1892, 772*l.* worth; in 1893, 963*l.* worth; in 1894, 667*l.* worth; and up to this time this year I have used 921*l.* worth.

39,748. (*Sir Nigel Kingscote.*) How do you calculate the value of your own home-grown corn?—I set it down at what I think it is worth in the market. I am booking my oats at 16*s.*, my offal barley at 20*s.*, my rivets wheat at 20*s.*, and my best wheat at 22*s.* I see my worst barley was booked at 16*s.*

ffal arley.

39,749. (*Mr. Little.*) Your offal barley is not worth a £, is it?—I make my offal barley pretty good; we make more than half tail this year.

39,750. Pretty good barley for feeding with us is only worth 14*s.*?—We cannot do anything of that with us.

39,751. (*Chairman.*) Then you must consume a large proportion of your produce?—I do.

39,752. What proportion of your produce do you suppose that you do consume?—I am consuming about 170 quarters of barley, besides all my wheat, oats, and beans.

onsumption of ome-grown roduce.

39,753. (*Sir Nigel Kingscote.*) I understand that this year you are consuming much more of your own produce than you have done before?—Yes, and buying no cake.

39,754. (*Chairman.*) Do you find that that is better?—I have not quite got the experience to say that; I am doing it as a trial.

39,755. At all events you think it an economy to do that?—I am seven miles from a railway station, you see. I have got those figures in connexion with an allowance under the Agricultural Holdings Act for corn of your own growth, so that I may put it down more clearly.

39,756. I suppose since 1879 there have been years in which you have made a fair profit; you spoke of 1879 as the commencement of the bad years?—I have a large dairy and I have sold my milk, and I have made a good bit of money with my milk and also with my sheep. I have been able to sell a good many sheep besides five rams to go abroad for breeding purposes, so that I have made a good deal of money with my sheep. Why I did not go further back than 1891 was because I had not got the figures to compare, because that is since I had the quantity of land that I now hold in good working order.

Dairying.

39,757. Do you consider that your dairying has paid?—That has been the next best thing to the sheep; but that I am afraid is going to the dogs.

39,758. Why is that?—Because they are lowering us down in price all the time, and I fear it will be lowered a good deal more too. I think it will not be worth doing.

Butter-making.

39,759. Do you make any butter, or do you sell the milk?—I sell my milk; I used to make butter, but that was very unprofitable, and the expense of labour and all that was so great, that it did not pay at all.

Reduction of rent.

39,760. Have rents fallen on the farms in your district?—On the Rothschild estate they have done in the other cases about the same as in my own. By the late Duke of Buckingham and by Lord Temple since he has had that estate adjoining me, the rents there have been very much reduced, and so on Lord Carrington's estates rents have been very much reduced. In fact, I think all the large estates have been very much reduced in their rents. Where the rents have not been reduced to any great extent is on the smaller estates where the smaller people own little plots of land.

39,761. You think that those rents have not been reduced in the same proportion?—I know they have not.

39,762. What should you say has been the reduction on the smaller estates?—It has very much varied. Take my own case where I have got 10 per cent. on a little farm; probably that is a fair example of the small estates.

39,763. But then that was on a farm taken only four years ago?—That was taken seven or eight years ago, since the times have got bad, but before they got to the pitch at which they are now.

Condition of farmers.

39,764. Are the arable farmers in difficulties in your district?—Our district is a mixed district, grass and arable, but more grass than arable, and that makes it rather better than many districts, I think. I know some of the farmers who are in very poor straits.

39,765. Are most of them dairy farmers or what?—Mixed farms—grazing farms. The grazing farms are generally more grass, but the mixed farms are more dairy farms.

39,766. Are there many cases of farmers farming their own land?—There are some that I know of.

Mr. J. Treadwell. 8 Feb. 1895.

Occupying owners.

39,767. What has been their condition?—I think they have been worse off than anybody, because many of them have got their farms, and borrowed a good deal of the money to pay for them, and they have got no reduction of rent, and so they have been in a very bad case, I think, altogether.

Cost of labour.

39,768. Then with regard to the cost of labour, has that been a serious matter with you?—It has indeed. I think that the labour question is a very important one. We have to pay so very much more for our labour, and do not get so good return for it. We have a great difficulty in getting the labour to attend to our stock.

Wages.

39,769. Has there been any fall in the wages of labourers lately?—Not more than 1*s.* a week, I think.

39,770. What is the average now?—My six days men are having 13*s.*, and the cattle men and shepherds, and stockmen have 16*s.* and 17*s.* The 16*s.* men have beer for breakfast.

39,771. Do the 13*s.* a week men get more in the harvest?—Yes, in the summer time they have a good deal of piece-work—hoeing in the season—haymaking and harvest time.

39,772. What do you consider that works out to in the year?—I should think that many of them, the best, can get at least 2*s.* a week more, and perhaps half-a-crown a week more, taking the year through.

39,773. That would be 15*s.* or 15*s.* 6*d.*?—Yes, I should think so.

39,774. Do you recollect the wages being much lower?—Yes. When I first went into business I paid 8*s.* a week for the six days men, and 10*s.* a week for the cattle men.

39,775. When did the rise come?—We gradually got up from that time; we did not keep there long.

39,776. Was there a great rise in your district in 1873?—I do not think so. When the strikes came about we were a little put about, but I do not think we had a great rise. There was a continual gradual rise, as far as I recollect, from the time I went into business from 1850 up to about 1880, I should think.

Rural depopulation.

39,777. Is there an increased tendency for the best men among the labouring classes to leave the districts?—I find it just this, that now those young fellows get so pert that you cannot speak to them, and if you see anything going wrong, and say anything to them, they say, "Give me my "money; I will go." They do not trouble about getting work about home, many of them, but go right away. That is the difficulty I find.

39,778. Apparently they know better how to dispose of themselves than they did some years ago?—They know better how to change; whether they better their position or not is another thing; but I am rather inclined to think they do not.

39,779. At all events, they think they do?—They like change; they go with the times.

Cost of labour.

39,780. Has the cost of labour been a serious item with you?—It has certainly with me. I pay about 2,000*l.* a year in labour, and I am at my wits' end to know how to get money to pay it.

Quality of cultivation.

39,781. Has the land gone back in cultivation on some estates?—On some farms it has. On the best farms I do not think it has, but on poor farms, and on land scarcely worth cultivating, no doubt it has very much indeed; in fact, some of it has literally fell down, as we call it—not been sown down at all, but gone down to grass without any assistance.

39,782. What becomes of it then, does it get into an utterly worthless condition?—No.

39,783. Does the natural grass come after a time?—On the heavy land the natural grass will come, and it gets into turf, I will not say as soon as if it is well sown, but it does in time get into turf.

Land laid down to grass.

39,784. How long does it take for the land to get into fair grass if it is left alone?—A man's lifetime pretty near. What I find in laying land down to grass—and I have done a good deal of it myself when my landlord wanted land laid down—is that, for two or three years you get a very good crop of grass, but after that the sown seeds, the small seeds seem to die away and you have nothing but bents on some of the land.

39,785. Then it takes a long time after that?—It is almost worthless then for years.

Mr. J. Treadwell. 8 Feb. 1895.

39,786. Have they tried laying down for temporary grass in your district?—Some of our neighbours, particularly I know on Lord Temple's estate, have been laying down their heavy land for two or three, or three or four years, and as soon as it fails to bear a good crop they plough it up again. That is what I am thinking of doing myself with some heavy land that I have got on my son's farm.

39,787. (*Sir Nigel Kingscote.*) Putting it down for three or four years, do you mean?—Yes.

39,788. (*Chairman.*) Without ploughing again?—Yes.

39,789. Is that becoming common in that district?—I cannot say becoming common, but on certain classes of land I think it is one of the best things one can do to meet the times. The expense of cultivating that heavy land altogether is so great that it does not produce enough corn at these low prices to pay for the cultivation. Then you see that displaces the labour, and what we want to do is, to lower our payments for labour to enable us to keep on at all.

The Agricultural Holdings Act.

39,790. What have you to say on the subject of land tenure and the Agricultural Holdings Act?—We want something to keep ourselves on the farm. We do not care so much about quitting; we want something to help us to stop.

Compensation for consumption of home-grown corn.

39,791. You do not think then, that any amendment of the Agricultural Holdings Act will be of much value?—Not to meet the depression. It would be of value when people leave their farms, of course. Take, for instance, the farm which I am thinking of leaving; if I had a good Agricultural Holdings Act, it would be an advantage to me there, but unfortunately I consume so much of my own stuff which would not be allowed for under the Agricultural Holdings Act.

39,792. Then it is a defect in the Act, that it does not allow compensation for your home-grown corn?—A most grave difficulty.

39,793. Do you think there ought to be an amendment in that direction?—Yes, I have always advocated it for years and years.

39,794. Would it be easy to find out how much has been fed on the home-grown corn?—I think it would be quite as easy to be found out. A man must show his books, and a valuer would soon see whether he had consumed more than he had grown and what he had sold. It would be just as easy to do as it is to find for cake or corn and purchased stuff, in my opinion.

Freedom of contract.

39,795. Is there any demand among the farmers of your district for judicial rents, or interference between landlord and tenant?—No, I think not.

39,796. Has it been discussed among the farmers?—Yes, but if anybody does mention such an idea he is almost hooted down in my district.

39,797. They prefer to remain as they are, with freedom to contract as they think fit?—The general opinion is that a man can make a better bargain with his landlord than any lawyer could make for him.

39,798. I suppose at the present moment in the main, the tenants have got the best of it in making a bargain?—As far as I myself am concerned, about this farm I am thinking about taking on again, I shall make my own covenant, and according to my own ideas if I keep it at all or else I shall not keep it.

39,799. The owner is more anxious to retain you than you are to remain, I suppose?—I think so.

39,800. Therefore the tenant has rather the advantage at the present moment?—I think so.

39,801. (*Mr. Chaplin.*) Your landlord knows when he has got a good tenant, I suppose?—He behaves very well to me; we are upon very good terms.

Protection.

39,802. (*Chairman.*) Now what have you to say with regard to the possible remedies?—I fear not much. I see when I wrote the heads of my evidence that I said protection is unattainable, and that I was not sure that it would be a remedy, but I am bound to say, though I have never said it before in public, that my mind has rather changed of late. I think we are getting so bad that unless there is some sort of protection given us in some shape or way that we shall all, if we do not go out of farming be killed out as it were. I am afraid we never shall be able to keep on unless there is something done. I have always thought that it was not attainable, and that those people who had protection were as badly off as we were, but when I heard it said that in France, where they have a large duty on wheat, they can make 30*s.* a quarter on their wheat, and that their land has increased in cultivation so much that they have a quantity to spare to export to us, it seems to me that it must be of advantage to us, if we could get some assistance in that way. But I fear it will not be in my time.

Mr. J. Treadwell. 8 Feb. 1895.

39,803. But till recently you very much doubted whether it was attainable?—I did, as Mr. Chaplin knows.

Bounty on wheat.

39,804. Then with regard to the bounty on wheat, is that a kind of recommendation that you would make?—That would answer the same purpose. If we got a bounty on home-grown wheat that would keep the land in cultivation, and enable us to live, but I do not know how it is to be done.

39,805. That is only the same thing in another form; is that not so?—That is as you please to put it.

Rates.

39,806. Then with regard to the rates; what are the rates in your district in the pound now?—Our rates in my union are not excessive—I do not think they have amounted to more than 2*s.* 6*d.* in the £; but situated as we are now I cannot see how the land is to pay rates or taxes at all. I think since the thing has so very much altered altogether we ought to be freed from rates and taxes.

39,807. What has been the course since you have been on your farm—have the rates gone down or gone up?—They have gone down.

39,808. What were they a few years ago?—They have gone down from about 2*s.* 6*d.* perhaps to less than 2*s.* in many parishes. Where I happen to have had a return got out the other day for a particular purpose, they have gone down considerably.

39,809. Was 2*s.* 6*d.* the highest point?—I think so. I went back for 30 years I think.

39,810. When did they begin to fall?—They came gradually down to about the middle time, about 15 or 16 years ago, when they come down rather with a rush. That would be, I apprehend, when the subsidies were given by the Government in relief of the rates.

39,811. (*Mr. Dalton.*) What rate went down at that time?—The poor rate, because it is all poor rate; the county rate is taken out of the poor rate and the subsidy was given to it.

39,812. Did not your highway rates go up after the abolition of turnpikes until you got the subsidy; did you have any turnpikes in your union?—Not in the parish in which I live; but there were turnpikes in the parish in which I occupy a good deal of land, but I forget how that was. Then we got a grant from the county.

39,813. (*Chairman.*) What is your union?—Aylesbury.

39,814. (*Mr. Little.*) Are you in a highway district?—We have no highway districts in Buckingham.

39,815. Then you have a separate highway rate from the poor rate?—Until now; but now we have done away with that because the county council took over all the roads.

39,816. (*Mr. Dalton.*) All the roads in your parish?—They have taken over the main roads and they contribute nearly the whole of the cost of the parish highways.

39,817. (*Mr. Little.*) The county council does?—Yes.

39,818. (*Chairman.*) If the rates have gone down from 2*s.* 6*d.* to 2*s.* and your rent was reduced from 40*s.* an acre to 26*s.* or 28*s.* we will say, actual agreed rent, you must have benefitted considerably from the two. I suppose your assessment has been reduced in proportion?—The assessment has been reduced up to the rent that was permanent, but the last 20 per cent. has not been reduced because we do not give it. I happen to be chairman of the assessment committee of our union. We do not allow the reduction in the rent for these per-centages unless they have been given for three years.

39,819. Then I take it that your assessment is about 30*s.* an acre?—It would be more than that.

39,820. Yes, a little over; about 31*s.* an acre?—Yes.

39,821. That is your present assessment. Now, if you have been reduced from 46*s.* an acre to 31*s.* an acre, that is a reduction of nearly 30 per cent. in the assessment. Then you have got a further reduction from 2*s.* 6*d.* to 2*s.* in the rate in the £, so that between the two you have got considerable alleviation in that respect?—Yes.

39,822. Turning to a return that I have got of the rating of parishes, I observe that the assessments for your whole union do not appear to have gone down much?—No.

39,823. The were 112,000*l.* in the year 1870 and 105,000*l.* in the year 1894. How do you account for that?

Mr. J. Treadwell. —There has been a very large amount of building going on.

8 Feb. 1895.

39,824. I am speaking now not of the house property, but of the land. The assessments on land, irrespective of buildings and railways, were 112,000*l.* in 1870 and 105,000*l.* in 1894, a reduction of only 6 per cent., how do you account for that?—I should have thought it had been more.

39,825. The house property, I see, has gone up from 32,000*l.* to 53,000*l.*, but looking at the condition you describe it seems strange that the assessment on land has been reduced only from 112,000*l.* to 105,000*l.*?—We made very large reductions, I am sure.

39,826. (*Mr. Little.*) Does that not point to the fact that it was not assessed up to the rent?—It must have been in some instances much less.

39,827. (*Mr Dalton.*) Has there been any alteration in the unions?—No.

39,828. (*Chairman.*) Is there much land of a very superior character in the valley which has not fallen in price?—That would be so to some extent; there would be land which has not fallen in price so much. For instance, the parish of Aylesbury assessment used to be 15 per cent. under the rental; we found that that was wrong; we had a new assessment of all the union, and ordered the overseers to put them at the rents, as near as they could get them anywhere, and then if anybody felt aggrieved they could go and get it put right upon appeal.

39,829. 15 per cent. below the rental?—Yes; we found that worked very badly because if anyone appealed we could not work our appeals then.

39,830. That seems to account for it; if you have got to add that 15 per cent. to the amount?—That would only be in the Aylesbury parish but there might be other parishes which would be pretty much in the same proportion.

Reduction of rents.

39,831. Do you consider that a further reduction of rent is necessary?—It must be; because the rents cannot be made. I am sure there is no rent made anywhere this year; it cannot be made.

39,832. From what you say there is still a considerable margin of rent in the case of the land which you hold under Baron Rothschild, which is now about 31*s.* an acre?—Yes.

39,833. Compared with many parts of the country that is not a bad rent?—No.

39,834. Therefore there is a margin, and a large margin of rent still?—I think we have 20 per cent. off that now.

39,835. Yes, but those, you said, were only abatements; they were not permanent?—Yes.

39,836. Therefore you and the owner between you think that they ought not to be considered as a permanent affair?—They will have to be so.

39,837 Is it likely to be so?—No doubt about it.

39,838. It would have to go further still?—I think so.

Allotments.

39,839. Is there anything in your opinion to be done in the way of encouraging labourers by giving them more allotments?—As far as we are concerned I employ labourers, and if they have more allotments than they have got now, they will not be any use to me. As far as I can see, if the land does not pay them any better than it does me, they will be a good deal worse off.

39,840. (*Mr. Little.*) Do you apprehend that allotments will be given largely under the parish councils?—Where there is a parish of good land they are all wanting this land, and they want the best off the best farms, which, if they have, of course the people will throw the farms up.

39,841. They have the power, under certain conditions, to take what land they require, have they not?—Yes.

39,842. And they will only take the best?—Certainly.

39,843. That is your experience?—I am satisfied of it.

39,844. That they not only want the best quality, but to be in the best position?—Yes.

39,845. If you take the eyes, or the best parts, out of the farms the farmers will be in a still worse position?—Yes. I myself, if they took my best land, should not continue to occupy the other.

39,846. Have your labourers had plenty of allotments?—Yes, they have had their rood, and so on.

39,847. Have they done pretty well?—Yes; where they have had good land, but I have known instances where they have had allotments and not very good land, and then they have simply thrown them up.

Mr. J. Treadwell.

8 Feb. 1895.

39,848. You are familiar with the different remedies that are proposed in public for this depression; are there any of them which you think would make a sensible difference in the position of the farmer?—I cannot see one of them.

Co-operation in the sale of produce.

39,849. What do you say about co-operation in the sale of produce?—Not a bit of it. It has been tried. Mr. Pell had a company and he had one of the best men in England, Mr. Turnbull, come up here to manage it, but that failed. If you establish a concern of that kind in London or in any other great town, the first thing you have to do is to get a trade. To get that trade you must sell cheaper than your neighbours, else you will not get the trade. Then that lowers the thing and makes it worse. It brings it down lower still. That has been the case with all these great things.

Fruit culture.

39,850. Then there is fruit growing?—This is my experience of fruit growing. We do grow a good bit of fruit, apples and things of that sort, and we send them to London, when we have got a lot to spare; they send us down a bill and sometimes we have something to pay for the carriage and for the selling, and nothing to receive. That has been my experience.

Account keeping.

39,851. I see you make in your brief a remark about keeping better accounts. I suppose you would not say that it is a disadvantage to keep accounts, but that the mere keeping of accounts cannot save a man?—I think it is quite right to keep accounts.

39,852. You do keep accounts evidently from what you have produced?—I do; I profess to set everything down. But that will not put any money into my pocket.

Sale by live-weight.

39,853. Then there is the selling of cattle by live weight; I suppose you have no objection to that?—I have no objection to it, but I can see no benefit from it. I think you have got to use your judgment as to what the dead weight will be just as much when you have got your live weight as you have before you have weighed them. There is such a varying difference in the offal of these different cattle that I think you have got to use your judgment just as much.

39,854. You yourself have a speciality in farming, but it is not everyone that can develop some special trade?—No, and the worst of it is, that as soon as you get a speciality there are a hundred other people copying you, and spoiling it.

Foreign competition and low prices.

39,855. Then your opinion is that the secret of the depression is foreign competition and low prices?—No doubt about it.

39,856. And that unless something can be done to raise the price you do not see how the agricultural interest can be maintained?—No, I cannot see that at all.

39,857. Do you see anything in the near future to lead you to suppose that prices will improve?—No, I think it looks like the other way. I think that we are sending our improved breeds of stock to other countries, that they are getting their stock better, that they are cheapening their transports, and I think that they are going to flood us with more foreign produce than ever we had, and that we shall get it from places where we have not had it yet.

39,858. The price of beef has been lower lately than it has been for a very long time, has it not?—Yes.

39,859. It has been down to a ruinous price?—Yes. I do not care about the price of corn so much, if I can sell my beef well, and my milk well, for I can use my corn and make beef and milk of it, but now when you have used it your produce makes nothing, and with pigs it is the same.

39,860. The price of pork has gone down even more?—Yes, I have been feeding a lot of pigs now.

39,861. And mutton will probably follow?—I think so; as soon as we get a little stock up of sheep in this country, and perhaps without it.

39,862. If there are to be a great number of unemployed the consumption will probably fall off?—No doubt about it.

Particulars of witness's farm.

39,863. To go back to a part of the Chairman's examination; is the smaller farm, the off farm of 200 acres, in your occupation held under the same landlord as the other farm?—No, it was under trustees when I took it, and now they have sold it. They hung on with it as long as they could, but now they have sold it; it was mortgaged up to the hilt.

39,864. Have you the same advantages there as you have in the other farm, do you farm just as you please?—

Mr. J. Treadwell.
8 Feb. 1895.

Yes. I have got an agreement there with something about the last year which ties me a little closely, but not much. It is a very liberal agreement; it was made by a farmer who was one of the trustees.

Payment of wages out of capital.

39,865. Perhaps you heard me ask the former witness a question as to whether the wages of labourers had not been in the last few years paid out of the capital?—There is no doubt about it.

39,866. Then if the position of the agricultural labourer has improved, it can hardly be maintained at its present level after the capital of the farmer is exhausted?—I think not. I am seriously considering whether I should not get out of my business altogether, because, as you see, by my figures I am losing my capital year by year.

Rates.

39,867. One or two questions upon the subject of rates: you have been chairman of your board of guardians for many years, I believe?—Yes, some 17 or 18 years, I believe.

39,868. Your union is one which is rather distinguished for good administration according to the law, is it not?—Yes.

39,869. And pauperism has been very much decreased in it?—From 1 in 12 down to 1 in 40 during my time, not as chairman, but during my time as guardian; I think I have been guardian for 40 years.

39,870. That has been partly by good administration, and partly by improvement in the circumstances of the labourers?—Yes. I think if you administer the Poor Law fairly, and without going to extremes, you create a population of people who are not desirous of becoming paupers, and who rely upon themselves more than you do in other ways. By having a lax administration of the Poor Law, I maintain that you encourage pauperism and worsen the people generally.

39,871. The great improvement in the condition of the labourers, the higher wages, and the greater purchasing power of their money, has helped to decrease the rates?—No doubt.

39,872. And what the farmer has lost the labourer has to some extent gained?—Yes.

39,873. Consequently the farmer is fully entitled to any reduction of rates which may have come in consequence of the decrease of pauperism?—I think so.

39,874. Therefore the mere fact that rates have decreased does not prove that rates are a fair burden, does it?—Certainly not.

39,875. And though you pay less in rates than you did, do you find that you are as well able to pay what you have to pay now as you were?—Not quite. I could pay a bigger rate when I had got a bigger income.

39,876. Do not these reduced rates take a larger part of the produce than they did?—Certainly.

39,877. That is a fact, and unquestionable?—Yes.

39,878. (*Mr. Dalton.*) Do you consider that the landlord or the tenant would benefit most if the rates were, as I understand you propose, taken off the land altogether?—I think a great many landlords require the burden taken off the land as badly as the tenants.

39,879. I am not saying that they do not require it to be taken off; I only ask which you think would benefit most?—I think the tenant would certainly, because there is no chance of the landlord putting any increased rents upon the farms at the present time.

39,880. Do you think if the rates were taken off, it would to some extent arrest the fall in the rent that you are anticipating?—No, not one bit.

39,881. Who is to pay if they are taken off from the land?—That I should leave to our statesmen.

39,882. Do you propose that the money should be raised in your union or that it should be raised by——?—The Chancellor of the Exchequer.

39,883. You think that the cost of the poor, and some of these other matters, should be a national charge then?—No doubt about it.

39,884. Are you aware of the report of the Poor Law Commission of 1834?—That is before my time.

39,885. I think they reported that the most disastrous thing for the administration of the Poor Law that they could well conceive would be the administration of relief being made a national charge; do you not think that it would to some extent induce lax administration?—No, I think the contrary, for this reason; you see that Government have the charge of the taxes and there are no more stringent officials of any bodies than those tax officials, therefore I think if Government administered the Poor Law, their officials would be quite as strict, and much more strict than many of us are now.

Mr. J. Treadwell.
8 Feb. 1895.

39,886. Do you think the Government should administer the Poor Law?—Of course if they find the money they would take care they administered it.

39,887. You do not propose, as some do, that the guardians should administer it, but that the Government should find the money?—I have always advocated this; I said what I should advocate was for the Government to pay for it and send down a paid chairman to administer the relief the same as we have paid magistrates.

39,888. Your rates now amount to 2*s.* in the £, I think?—It is about that.

39,889. What does that come to an acre?—If you take the value of our union I suppose it would be about 2*s.* an acre.

39,890. And the rent would be about how much?—About 1*l.* I should think.

39,891. Do you consider that the rates bear a larger proportion to the produce than they formerly did?—No doubt about that.

39,892. Do you consider that the rent does?—Yes.

39,893. If the rates be according to the rent, it would follow that the rent bears a larger proportion than the rates do to the produce?—I do not quite follow you.

39,894. Your rates go according to your rent, I understand?—Yes, they do, with the exception of this abatement.

39,895. But speaking generally they go according to the rent?—Yes.

39,896. You say the 2*s.* per acre rates that you pay now bear a larger proportion to the produce than they did formerly?—Yes.

39,897. It would also follow that the 20*s.* which you pay for the rent will also form a larger proportion to the produce than it did formerly?—Yes, it takes more produce to pay it, you know.

39,898. Therefore if you take the proportion of the rent and the rates to the produce, the grievance is 10 times as great in the case of the rent as it is in the case of the rates, the rent being 10 times as great as the rates, so that your grievance against your landlord is much greater than your grievance against the rate collector?—No, because I think the rent has been reduced in a much larger proportion than what the rates have.

39,899. I understand that cannot be the case, because you pay your rates according to your rental?—Yes.

39,900. Therefore they have had that reduction, and they have also had a reduction from 2*s.* 6*d.* to 2*s.* in the pound besides?—This last 20 per cent. which we have had abated, does not come into the calculation, and that makes one-fifth difference.

39,901. That is a temporary business?—But that will have to be a permanent one, and it will have to be more still, so that I cannot quite see that you are correct in what you put.

Consumption of corn and cake.

39,902. (*Mr Clay.*) You seem to go in largely for the use of cake, and your own home-grown corn upon your farm?—I have done.

39,903. And have you found it very beneficial, especially upon grass?—Yes, very much so upon grass.

39,904. Is that the reason that you are under the Agricultural Holdings Act—you consider you are safer there?—No, we consider ourselves safe altogether without anything under the Rothschilds. We do not think much about that.

The Agricultural Holdings Act.

39,905. But you believe in the Agricultural Holdings Act giving compensation?—Certainly; if you are going to leave, it is most necessary that there should be compensation for unexhausted manures.

39,906. But the Agricultural Holdings Act only deals with outgoing tenants?—That is so.

Compensation for consumption of home-grown corn.

39,907. So I think you would like, by your evidence, to see home-grown corn taken into account in the Agricultural Holdings Act?—Most decidedly; I have always advocated that.

39,908. And you would see no difficulty of arriving, by properly kept accounts, at evidence to give to the arbiter or the landlord, showing that you had used such a quantity of corn on your farm?—Not at all.

Mr. J. Treadwell. 8 Feb. 1895.

39,909. You heard the examination of the first witness to-day, and what I asked him about manures, such as undecorticated cotton cake, and others?—Yes.

Use of undecorticated cotton cake.

39,910. Have you found them more beneficial for sheep and grass than you have the oil cake?—I have always thought that where I used the manure from the decorticated cotton-cake it gave me better return than the manure from anything else. When I have given my sheep, for instance, on the roots decorticated cotton-cake, I have always thought that the barley yielded better after that than it did after anything else. But I have no data to go upon, it is simply my own practical knowledge of what the result was in my own mind.

39,911. In your experience, and it has been a long experience, you have had more advantage from this class of cakes than any other kind?—I think so. I use a great deal of undecorticated cotton-cake, and maize meal for my dairy cows, and have thought it very advantageous. I took the cue from poor old Dr. Voelcker; he used to tell us so, and I used to take notice of what he said.

Mr. J. Treadwell. 8 Feb. 1895.

39,912. I think you will bear out this, that nothing will recoup, or make a pasture as quick as a liberal use of cake by either sheep or catttle?—I am quite of that opinion. I think I have proved it up to the hilt. I feel satisfied now that this high farming means higher losing. When our produce made a good price, high farming paid very well; but now, the higher you farm, the more money you lose I think, at the present price of produce.

39,913. That is on account of the depreciation of the produce off the farms, either beef or mutton?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Seventy-Fourth Day.

Thursday, 14th February 1895.

PRESENT:

VISCOUNT COBHAM IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Major PATRICK G. CRAIGIE called and examined.

Major P. G. Craigie. 14 Feb. 1895.

39,914. (*Viscount Cobham.*) I think you are Director of the Intelligence Division of the Board of Agriculture?—I am.

39,915. You are come here to-day prepared to give evidence upon certain tables and memoranda handed in by Mr. Elliott, the Secretary to the Board, relating to the position of agriculture in foreign countries?—Yes.

Agriculture in Denmark.

39,916. Will you state shortly what those documents are, and on what information they are based?—The first document which was put in is a memorandum on the agricultural features of Denmark, and the steps taken to develop the export trade in dairy produce, live stock, and bacon, from that country. The memorandum makes mention of the different authorities which have been consulted in compiling the statements made. These are the agricultural and trade statistics of Denmark, the various consular and diplomatic reports, which have been issued by the Foreign Office, from that country, and also Danish works, such as a Danish work on the dairy industry by one of the State dairy advisers, and a report by the Superintendent of the Department charged with the supervision of the State consulting agricultural advisers in Denmark. (*See* Appendix A. XX.)

39,917. You have not been in Denmark yourself, have you?—I have not been in Denmark, and I have no personal knowledge of that country except from the returns and reports.

Agriculture in the United States.

39,918. Then as to the memorandum respecting the agricultural position of the United States of America. (*See* Appendix A. XXI.)?—That is a memorandum tracing, again, mainly from official documents, the position of agriculture at the present time in the United States of America, the changes in the extent of land under wheat, the changes in the production and export of grain, and the changes in the production and export of live stock and dead meat from that country, with certain incidental figures which I have collected during visits that I have paid to the United States. The reports of the Census are the basis of the first part of the figures; the different reports and returns of the Agricultural Department of the United States I have also used to show that in some respects they corroborate, although in some they slightly differ from the Census; and then again reports from some individual boards in particular States of the Union, which I obtained directly, are given more as an illustration of the class of statistics that are locally prepared for the use of the farmers in the States themselves.

Major P. G. Craigie. 14 Feb. 1895.

39,919. You have visited the States yourself, I believe?—On two occasions. I visited the States in 1884, and travelled through a considerable number of the States, as far west as Utah and Idaho, and returning through the Northern States, through Dakota and Minnesota, and back to the eastern sea-board on that occasion. In 1893 I again visited the States, and passed through the Eastern States, visiting several of the experimental stations and colleges, as I was asked to do on behalf of my Department, and afterwards I paid a private visit to the West on my own account, when I went as far as California and down the Pacific Coast, and came back through the Southern States and New Orleans.

39,920. How much time did you spend altogether?—On the first occasion three months or a little more; on the second occasion I was only two months away; I was on official duty for about three weeks of the time, and took holiday part of the time.

39,921. With regard to Memorandum No. 3, will you please describe it. (*See* Appendix XXII.)?—Memorandum No. 3 consists of a series of figures extracted from our returns, showing the acreage of corn crops as a whole, the acreage of wheat, the acreage of potatoes, and the numbers of cattle, sheep, and swine in certain European countries, which I understood Mr. Elliott undertook to put in when he was before the Commission. Those are put forward rather for information than for any comment that I have to make.

Agriculture in Denmark.

39,922. We will take the subject of agriculture in Denmark first: we think that the information you have given us in this document is so complete that it will not be necessary for me in examination-in-chief to go through the whole of it, as it would be practically merely a repetition;

Major P. G. Craigie.
14 Feb. 1895.

but would you kindly give us the general purport and effect of this memorandum. (*See* Appendix A. XX.)?—The memorandum on Denmark begins by showing the extent of the territory and the character of the cropping, so far as our official figures permit. I would point out that the latest figures as regards acreage only come down to 1888, and I am not in possession of more recent information from the Danish Government.

39,923. You give us a table giving a description of the various crops from 1871 to 1888?—For such dates as are available.

39,924. What are the most striking features in your opinion in this table?—I think that one of the features that must attract attention, coupling the effect of that table with the nature of the exports from Denmark, is that what we should call arable land is drawn upon very largely for the production of dairy produce. This is obvious since the entire extent of grass meadow and permanent pastures, according to the latest returns here, are not three millions; adding the clover and grass, they come to about three millions or a little more, while the arable land, other than clover and grass is nearly as great.

39,925. With regard to the live stock, it is shown here that horses, cattle, and swine are very largely increased in numbers, but that sheep have diminished?—That I think is a feature which may be said to be perhaps common to Europe. An increase of cattle seems more general, and a decrease of sheep seems very general, but the sheep in Denmark have fallen off very considerably indeed. In the period given in the table they have fallen off by one-third of their whole number; the cattle do not appear to have increased more than about a fourth—a little more than a fourth,—but swine have increased considerably. The number of cows are shown in the second table, and they have increased in the 20 years from 800,000 to rather over a million.

39,926. The increase in the cows pretty nearly accounts for the increase in the cattle generally?—Not quite; there is the young stock; but I would point out that the increase in the number of cows in Denmark does not do more apparently than keep pace with the population of Denmark. There are only 449 cows per 1,000 of the population now, and there were 448 per 1,000 of the population in 1871.

39,927. Probably the produce from the cows is considerably increased, owing to the improved system of management?—I think it is obvious that some improvement must have taken place in the production. Besides that, the following tables will show that there is a considerable import of dairy produce into Denmark as well as export from Denmark; and probably some of the dairy produce imported into Denmark is consumed in that country not being quite of as high a class as the produce that is made in the country and exported. I think the subsequent tables would rather indicate this.

39,928. (*Mr. Little.*) Spurious dairy products also, such as margarine?—The import of margarine is shown. I think a very large quantity of buttter comes in as we see on page 5 of the memorandum. (Appendix XXI., par. 17.)

39,929. (*Mr. Lambert.*) Have the imports of artificial feeding stuffs in Denmark increased enormously since 1878?—Bran and oil cake.

39,930. Would that not to some extent account for the increased productive power of the cows?—Undoubtedly it is one of the features.

39,931. (*Viscount Cobham.*) How do you account for the considerable increase in the number of horses in Denmark?—I have not seen in official returns any distinct reason for the increase in the number of horses in Denmark. I fancy that the increase is almost entirely in the better class of horses in Denmark.

39,932. For export?—Yes, to a large extent. The export of horses has not been shown in the returns that I have got. But there is a somewhat considerable export trade in horses.

39,933. I was rather surprised, because arable farming has probably somewhat diminished?—The arable land does not show much diminution in Denmark.

39,934. It has diminished, I think?—It has on the whole, I think. I am not prepared to say that the number of horses returned from Denmark are as here only those employed in agriculture, they may be on the farms, and may be employed for other purposes. Of course there is a good deal of internal trade—small men working in other directions as well as on their farms. I have no official returns on the subject of horses in Denmark distinguishing the one kind of horse from another.

39,935. Will you take the table showing the imports into Denmark of bran and oil-cake?—That shows a large increase of those substances.

39,936. An increase in bran of from 12 millions and a half lbs. in 1878–9 to 194½ millions in 1892–93; and in oil-cake from 13¾ millions lbs. to 150½ millions in the same period?—I think I would point out that the increase in bran, although it was very great up to a certain date, has not continued. It has fallen off since 1890 rather considerably. The present figure has gone back to about where it was eight or nine years before. The increase in oil-cake was continuous up to 1891; there seems to have been a slight decrease since.

39,937. (*Mr. Lambert.*) Might that not be accounted for by the Denmark people using their beet instead of the bran, and also using their home-grown corn instead of oil-cake?—It is very probable.

39,938. (*Viscount Cobham.*) The export trade in agricultural produce from Denmark is confined to animals, animal products, and barley. The net exportation of those animals for a series of years is shown in the table at the bottom of page 2; what is the general effect of that table?—There is nothing very remarkable except the falling off in sheep, I think. (Appendix XXI., par. 7.)

Danish export trade in agricultural products.

39,939. And that has practically come to an end?—The live animals, of course, have been exported very largely to this country, and in so far as in the latest year the trade with Denmark was necessarily interrupted on account of disease, the falling off in the latter year is probably not an economic necessity—not from the number of cattle falling off, but because of the necessity of restricting the trade in live animals. There has been some slight development in Denmark, which I have not mentioned in this memorandum, because it has only come under my notice very recently, of the trade in dead meat which of course takes the place to some extent of the exported live animals—I mean in fresh meat; because the importation into this country of Danish cattle is prohibited. Therefore they have turned their attention to sending meat over in a fresh form and killing it on the other side. Several export abattoirs have been started, and experience has shown so far that although it is not so profitable a trade altogether as was the trade in live stock, it offered a considerable means of disposing of their fat stock and especially of their old cows.

Dairy industry in Denmark.

39,940. The figures show a very large increase in the export of both butter and bacon; to what causes do you attribute that great development of the export trade?—Various causes operate to produce that. As I have mentioned before, there is to a certain extent an import of foreign butter which is shown in the later tables, which enables them to dispense with some of the produce of their own country. The production of butter has also been developed by the effort of the Government to direct attention to the dairy trade, and by the large extension of a co-operative system of dairying, which is described in this memorandum, by the educational efforts that have been made in Denmark, and by the assistance lent by the Government by agents abroad to push the trade in Danish products in other countries.

State aid to the Danish dairy industry.

39,941. Can you state a little more in detail what the State have done to promote the dairy industry in Denmark?—On page 3 of the memorandum I have mentioned the encouragement which was offered originally by the Royal Danish Agricultural Society, and seconded afterwards by the Government inducing a number of scientific men to undertake researches to determine various questions that were in doubt about the processes of dairying. (Appendix XXI., par. 10.)

39,942. Is the Royal Danish Society supported by the Government?—It is very closely associated with the Government as will be seen in several parts of this memorandum; it is an independent society but largely helped by the Government.

39,943–4. In money, or in other ways?—The grants I think are detailed in a return which this Commission obtained from the Foreign Office, a paper showing the assistance which the Government gave in various forms. I think, it was a return in answer to an inquiry sent by this Commission, and as it was before the Commission already I did not include figures in the memorandum communicated. The several steps taken are detailed in this report beginning with the reports of the Royal Danish Agricultural Society and the technical steps taken by the agriculturists themselves in directing attention to selection, feeding, and management of cows; the promotion of winter calving, bringing the cows into milk at seasons of the year that will enable them to turn out the milk at a better advantage; and in particular the action of co-operation, enabling them to

Major P. G. Craigie. 14 Feb. 1895.

bring their produce to the centres, and to so distribute it to advantage. But the direct action of the Government is also shown in the appointment of officers as advisers, and also more recently by the appointment of consulting experts abroad. On page 13 the instructions of the agricultural experts are detailed, both in the case of the consulting dairy expert and of the consulting dairy expert who is sent over to England, and also the instructions of the officer who is consulting expert in live stock. (Appendix XXI., par. 30.)

Prices of Danish butter.

39,945. The result has been that the exports into the United Kingdom of butter have been enormously increased and that the butter commands the highest market prices here?—The prices are detailed on page 4, so far as we have obtained them from Mr. Boggild's work. (Appendix XXI., paragraph 15.)

39,946. Would they compare with the prices of the best home-made butter?—We are not in possession of any very really good series of statistics of the price of butter in this country. We have no good return of dairy produce. Butter, of course, varies very much with the season of the year in price, and in different places. We have the Irish figures which probably are the most complete. That, of course, is a butter which is rather different from the Danish. Danish butter has taken a very high name as a rule in our markets here up to the present time.

39,947. It is sold all over the country, even in the smallest towns and villages?—It is. The Danes are now professing a good deal of alarm as to their ability to hold the market in the face of the Australian competition to which they are likely to be subjected in this country.

Danish exports of butter.

39,948. Have they been able to maintain the export pretty steadily during the autumn and winter?—They keep up their export very closely to the demand; they seem to gauge the market very carefully, and I think their practice with their calving and stall feeding throughout the winter, producing their butter uniformly throughout the year, prevents their having it all at one time, and so burdening the market at one time. Then the co-operative dairies, of course, manage their business so as to meet precisely the demand that they find abroad, so far as they can. The regulations of some of those societies have been given in this memorandum in case of the Commission's desire to see them, on pages 6 and 7. (Appendix XXI., paragraph 19.)

39,949. (*Mr. Lambert.*) Are those figures compiled from a return presented to Parliament?—The earlier figures?

39,950. I mean the whole of them?—From different returns; from the Danish trade returns, and certain returns sent by our Consuls from that side, and whatever sources we can get them, but they are all from official sources, either Danish or British.

39,951. If I recollect aright, there was a return presented to Parliament about, say, 12 or 18 months ago, showing the nature of the dairy-farming in Denmark and in other countries, Sweden and Germany (C. 7019; 1893)?—That is a return issued by the Board of Agriculture.

39,952. Are these figures compiled exclusively from that return?—Not exclusively from that return; we have taken that return as giving the figures which we had at the date of that return, supplemented by any more recent returns we have.

39,953. This is brought up to date?—It is brought up to date from all the sources from which we could receive information, but a number of the figures are in the earlier report.

39,954. (*Viscount Cobham.*) Have any of the figures been collected by the Agricultural Department without having been laid upon the Table of the House of Commons?—The Report, C.-7019, is a Parliamentary paper.

39,955. Are the figures you give to-day wholly derived from this report?—No, from that and other later sources. The Foreign Office have published several consular reports, and we have also the Danish statistics in the original Danish.

39,956. (*Mr. Lambert.*) Are all the figures contained here available through returns that are available to the public, or have they been laid upon the Table of the Houses of Parliament?—A very large proportion of the figures are certainly embodied in the consular reports and in our report, but I should not be prepared to say that we have not got some returns from Danish sources, which may not be in those, because we have had the original Danish returns sent over and translated.

39,957. (*Mr. Giffen.*) And in any case you have brought the figures together, as they are not brought together in any other return?—They are not brought together in this compact form in any other return.

Major P. G. Craigie. 14 Feb. 1895.

39,958. (*Viscount Cobham.*) Then you say that in order to maintain this great export of butter there is a considerable import of butter into Denmark, would that be mostly butter of an inferior quality?—As regards the butter from Finland, the impression I have gathered from the returns is that it is of an inferior quality. There is a certain amount coming in probably from Finland which is returned as from Russia.

Imports of butter into Denmark.

39,959. They probably consume the inferior butter and export the best?—I think it is probable; the figures rather suggest that. It ought to be pointed out that they do receive some butter even from ourselves. In these three years mentioned, a few hundred thousand pounds were imported both from America and from England. But the great import into Denmark comes from Sweden, and Sweden herself is now a country which exports a considerable amount of butter direct to this country.

Consumption of margarine in Denmark.

39,960. As to the manufacture of margarine in Denmark, is that conducted under strict restrictions?—I believe the figures as regards margarine are given on page 12 of this memorandum. According to the Danish paper that is quoted, on the 19th October last there were 16 margarine factories in Denmark itself, and the total production of margarine in Denmark was therefore nearly 18 million lbs. in the year up to 31st March last; and the import of this article was not a very great amount; the import only amounted to about 2½ million lbs., but while they made a large quantity in Denmark itself, their export is practically nil, they have very careful regulations on the subject. (Appendix XXI., paragraph 27.)

39,961. (*Mr. Dalton.*) Is it the fact that they do not send over any of that as butter or mixed with butter?—A very stringent margarine law has been passed in Denmark. It was the subject of a consular report that was circulated some years ago, which showed the various tints and colour allowed by the peculiar regulations that they make to ensure that no margarine should be exported as butter.

39,962. (*Mr. Giffen.*) Are you aware that the Danish Government have been very anxious to get our Government to adopt very stringent regulations here as to the manufacture of margarine, so as to put all on the same footing?—Certainly.

39,963. And that they are not in favour of the development of margarine at all?—Not at all; they are very strongly of the other way of thinking.

Danish co-operative dairies.

39,964. (*Viscount Cobham.*) You give here the articles of association of a co-operative dairy; is that fairly representative of the lines upon which these associations work?—I think so, according to the best of my judgment.

39,965. Are the associations themselves in the nature of a limited company?—They are in all cases made up of farmers who produce the milk. Outsiders, I think, are not brought into the companies at all, for the purpose of profit, so that it is really persons who are themselves producers who are combined in these companies. Whether they are technically limited companies for the moment I cannot say.

39,966. The main object of the association is not to earn profits for the association?—The object is profit to the producers rather than a profit on the working of the company.

39,967. (*Mr. Little.*) The interest in the association is attached to the farm, it appears?—It is.

Wages of agricultural labourers in Denmark.

39,968. (*Viscount Cobham.*) Then dairy shows, I see, have been promoted of late years in Denmark?—They have with a view of improving the stock and the produce.

39,969. Lastly the memorandum deals with the wages of agricultural labourers in Denmark, and you give us some figures, showing that there has been a very large increase in the wages of Danish labour?—Those are taken from Danish sources, from a report by Captain la Cour, who is director of the department charged with the supervision of the consulting experts. He gives certain figures with regard to the labourer's wages which are interesting, and which show the wages paid at the dates given. I have nothing for 1894, but apparently I understand that wages in 1893, were considered to have somewhat dropped from the level at which they were before. It will be observed that the table in my paper on page 17, does not give the intermediate years between 1888 and 1893, but only gives them for such years as are available. (Appendix XXI., par. 39.)

Major P. G. Craigie. 14 Feb. 1895.

39,970. Still, there has been a very large increase in the rate of wages since 1871?—A very large increase. The centre table on page 17 shows that very clearly. In the case of the adult male labourer, the wages rise from 7*l.* 11*s.* 8*d.* to 12*l.* 1*s.* 7*d.*, and women's labour rises from a little over 4*l.* to a little over 6*l.* (Appendix XXI., par. 40.)

39,971. Has the effect of that increase been that agriculture in Denmark is under some depression at the present moment?—That seems to have been the complaint in several districts.

39,972. They also have to contend with an increasing amount of foreign competition?—They are afraid of that.

Export of milk from Denmark.

39,973. Can you give us any more particular information as to the position of the Danish farmer?—There is a new development which has only come under my notice within the last day or two; that is, the export directly of milk as distinct from its product, is being projected. It is understood, I believe, that some arrangements are being made by a company at Copenhagen, for the export of something like 10,000 gallons of frozen milk a week to the United Kingdom. That is only a project as yet. We are now receiving milk as a part of our regular import from Holland, and this would be an increase of competition in a new direction in this country.

39,974. Where is the milk taken to—London?—The milk that comes in from Holland, I think, comes, a good deal of it, to Harwich. I am not certain how it is distributed, but I fancy it comes to London eventually.

39,975. (*Mr. Everett.*) Is that frozen, do you know, or does it come in a liquid condition?—This latest proposal of Denmark, I understand, is for distinctly frozen milk.

39,976. You do not know about the Dutch milk?—That I have not included in the present subject of inquiry.

39,977. (*Mr. Giffen.*) There is direct steam communication between Denmark and Harwich, is there not?—There is between Denmark and Harwich, and between Denmark and Hull, I think.

Size of farms in Denmark.

39,978. (*Mr. Gilmour.*) Have you any figures of the average acreage of the farms which are affected by this system of co-operative dairying?—I think information on this subject will be found in the report of Mr. Jenkins to the last Royal Commission, which is, I think, in the hands of this Commission. He gives typical examples of the size of the farms which he visited under the dairy system, at the beginning of this book.

39,979. They are small, I suppose?—They are a great many of them small, certainly; but not all of them are small by any means; there are some large farms among them, but there are more small farms than we have here. The advantage of the co-operative system is that it enables the small men to make the best use of their produce. They have not quite the machinery on their own premises to deal with the milk product, so that they do it by means of those co-operative associations.

39,980. Have you any general information to show how individually these small farmers are benefited by this system?—I have no other direct information than that which is put in the paper.

Danish bacon exports.

39,981. What class of bacon does this Danish bacon compete against in our country; do you know the quality of it, is it a high-class bacon?—I am afraid I am not able to answer that point directly. I understand that the bacon factories have not been quite a success everywhere. I have seen Danish statements to the effect that they are considering that they have been trying to do rather too much in the way of bacon exports. I fancy that they have not been pleased with the prices that they have obtained for their bacon; but there is a very considerable export. I am not prepared to say what the quality of the bacon is; I have not sufficient expert knowledge.

Danish consulting experts.

39,982. Have you watched the manner in which the duties of those consulting experts in England have been carried out?—I have had occasion to hear how their work is being done, and certainly it seems to have been very well done. They keep their own government and their own producers very well informed of every change of price, and show themselves very much on the alert in watching for everything that may affect Danish butter in our own markets here.

39,983. And that is really a good and practical part of their scheme?—Undoubtedly.

Increase of arable dairying in Denmark.

39,984. (*Mr. Little.*) The official returns as to cropping are a very great contrast to our returns in respect to the large increase of arable land while pasture land remains stationary, or practically stationary?—I think I have already said that one of the features of this table apparently is that it is a case of arable dairying very largely.

Major P. G. Craigie. 14 Feb. 1895.

39,985. There is an increase of corn crops which we have not?—There is a considerable increase in oats.

39,986. There is an increase of about 12 or 13 per cent. in corn crops taken altogether it seems; and clover and rotation grasses seem to have increased by one-third?—Undoubtedly; and I believe that is very largely for use in dairy work.

39,987. The increase in the cultivated area is very similar to that in our own country, they bring a larger quantity into account than they did before?—Of course, that remark is always subject to the suggestion that any returns which have been collected after a series of years probably become more strict and more accurate as time goes on, but land may be also brought into account which was not formerly brought into account.

39,988. What has puzzled people in reference to our own returns is that while it is said that land is going out of cultivation, land under crops, bare fallow and grass, almost every year shows an increase?—That feature would be the same in the Danish returns.

Danish butter quotations.

39,989. You have given us a table of the wholesale prices of butter, and you state that the prices are fixed by a committee at Copenhagen; do you know whether that committee is a committee of interested persons like the Cork Butter Market Committee?—The committee are a committee appointed for the purpose; they represent producers, export merchants and butter brokers.

39,990. I do not know whether you can tell us whether they are disinterested or interested persons?—They are interested persons as producers and exporters.

39,991. Then it differs from the Cork Butter Market Committee which is entirely a committee of traders?—I am not acquainted with the constitution of that committee.

39,992. The great increase in the export of dairy produce, and the great improvement in quality of that produce, have been due, I gather from this memorandum, greatly to co-operation?—That is my impression.

Regulations of co-operative dairies.

39,993. And to the stringent regulations which those co-operative societies have impossed upon the members with regard to the breed of cattle, the food they consume, the manner in which the milk is handled, and generally?—And on the quality of the product, they have kept up the uniform quality of the product.

39,994. I mean those regulations have been made with a view to improve the character and quality of the produce, and they appear to have been very successful?—That is so.

39,995. The system of paying for the milk according to its fat contents, has been very beneficial?—I think so, undoubtedly.

39,996. Because it has prevented adulteration. Are you aware whether it has been attempted in England at all?—Yes, I have certainly seen it advocated, but I do not know how far it is a matter of practice.

39,997. You do not know of any case where the large buyers of milk, or the factories, have laid down a similar scale for payment?—I am not aware that that has actually been done here. I have certainly seen it advocated.

Consulting agricultural experts.

39,998. We have nothing like this Danish system of having experts stationed in foreign countries for the purpose of watching the development of our trade?—Not that I am aware of.

39,999. Your Department has nothing of the kind?—No, we have no means of that kind at present.

40,000. (*Mr. Giffen.*) We do not export our agricultural produce, I suppose?—We do export certain forms of agricultural produce to great advantage, such as high-class stock and a few very special articles; horses, for instance, are exported to advantage.

40,001. If we were to do it for agriculture, I suppose we would have to do it for the thousand and one other industries which we have in the United Kingdom, whereas in Denmark they have only one industry practically?—(*No answer.*)

Agricultural depression in Denmark.

40,002. (*Mr. Little.*) With all this export of dairy produce, and the great increase in the quantity produced, they have not been able to secure themselves in Denmark against agricultural depression?—Apparently not, judging from the reports of meetings in Denmark that we have seen recently.

40,003. I see on page 16 that they attribute the depression to the fall in prices of live stock, cereals and butter which has been brought about by foreign competition, and that they also complain of the increased rates and taxes, the

Major P. G. Craigie. 14 Feb. 1895.

enhanced expenses of management and maintenance of holdings, and the great cost of labour as contributory causes?—All those are urged as reasons. (Appendix XXI., par. 38.)

40,004. They are complaints which are very similar to those which are made in England, are they not?—Very similar.

Danish exports of bacon.

40,005. (*Mr. Dalton.*) I see from the table on page 3 that the increase in the export of bacon is even larger than the increase in the export of butter?—In weight. (Appendix XXI., par. 8.)

40,006. The number of swine have increased more rapidly than the number of cows, have they not?—I think it should be pointed out that the keeping of swine is very closely associated with dairy business, and can be worked into the work of the dairies.

40,007. Do you think that that accounts for the whole of the increase?—Not the whole, probably, but a very large portion of the increase. The development of the dairy trade will necessitate an increase of swine in order to use the by-products of the milk.

40,008. The increase in the export of bacon is considerably larger than the increase in the number of swine; what do you attribute that to?—I have no doubt that the development of the pig stock of Denmark has proceeded as well as the development of the cattle, and that a quicker fattening has been produced, and that a larger number of animals are turned off from the same nominal herd.

40,009. Is it as important a branch in the agricultural industry as the dairy farming?—It is not so important, and recently it is not giving satisfaction as regards prices. On several occasions lately it has been pointed out that they have been rather overdoing the export of bacon, and that too many factories have been started without very great commercial success.

40,010. You do not at all know what is the price of the bacon that they send or the quality?—I think probably a rough approximation could be ascertained from the Board of Trade returns by taking the values of the imports of bacon which come here. We could ascertain the value of the Danish imports in that way, but I have not got the figure with me.

Consumption of margarine in Denmark.

40,011. You have no doubt, with regard to this large production of margarine, that it is entirely consumed in the country, and that none of it comes over here in the butter?—I have no reason to suppose that it does come out in Danish butter. I know the efforts they make to prevent it are very great, and that they are very anxious indeed to have any case in this country, where there is any suspicion of margarine being in the butter, proved and detected. We have had representations on the subject frequently from the Danish Government.

40,012. There seems to be very much less butter per head of population consumed in Denmark than was formerly the case?—It would appear that they are consuming the margarine themselves.

40,013. Is it because they find it so good, or because it is so very much cheaper?—They find it suitable to their own wants, I suppose, and they prefer the profit on the butter.

Spergula.

40,014. (*Mr. Little.*) Do you know anything about the spergula, which figures so largely in one of the tables?—It is of course used as a forage crop.

40,015–6. Is it grown annually?—I am not acquainted with the way in which it is sown; I fancy not. It is a crop which occasionally, I think, I have seen in this country as a very rough weed.

Danish co-operative dairies.

40,017. (*Mr. Lambert.*) Do you know how many cows it takes to keep a co-operative dairy factory going, what would be the minimum number?—I do not think I have an actual statement of the minimum number of cows. They vary in number, certainly, according to the area. In paragraph 12 of the Articles of Association there is mention made of the number of pounds that any member must send in; if a member supplies less he has to take certain special steps in sending in the milk. (Appendix XXI., par. 19.)

40,018. My meaning was, how many cows it would pay a certain district to keep, or how many cows it would be necessary to keep in a certain district, in order to establish a dairy factory according to the Danish plan?—I am afraid I have not got information on that precise point of the number.

40,019. You, of course, would not be able to say how far the dairy factory would be from the holding of the actual producer of the milk?—That must vary in different districts.

40,020. I wanted to know how far a man could profitably send milk to these dairy factories?—I think paragraph 12 deals partly with that. If a member supplies less than 100 lbs. daily he must take the milk to the nearest high road along which the dairy cart runs. He does not himself send it the whole way; the cart collects it at certain points and will collect it from his farm if he has larger quantities, for, as the paragraph says, quantities exceeding 100 lbs. will be collected from his house. (Appendix XXI., par. 19.)

Major P. G. Craigie. 14 Feb. 1895.

40,021. You have no information as to the extent of the round traversed by these carts?—I am afraid I have not the actual mileage. That must be a matter for regulation in each case. It must differ very much I should imagine.

40,022. Naturally, but I wanted to know whether you had any information for the guidance of English farmers who may, perhaps, care to start butter factories?—The information does not give the actual mileage travelled by the carts.

40,023. A rough general estimate is all I want, and also how many cows it would be necessary to keep. You say that lately there has been a project for delivering frozen milk to London from Copenhagen?—Yes.

Freights on milk and butter from Denmark.

40,024. Could you give us at all the rates for the carriage of the milk from Copenhagen to London?—I am not in a position to state that any milk has yet been carried, therefore I do not think there is any rate quoted; I have not seen any rate quoted myself. I think it is, as I mentioned before, as yet a project only.

40,025. I understood that, but I do not know whether you have any information of the rates which are charged for milk from Copenhagen to London?—I have not with me at this moment.

40,026. Would you have the cost of conveying the butter from these butter factories to London?—The rate of freight?

40,027. The cost of conveying; how much they can put their produce upon our market at?—We know the general price which the produce commands here, and there is the price given on page 4, and from that we could form our impression of what it is, but I have not the freights on butter. (Appendix XXI., par 15.)

40,028. Would it not be interesting to get them in order to compare them with our own?—I have not got any information on the subject. It might be desirable to obtain them if they could be obtained, but I should imagine they may fluctuate very much from time to time probably.

Danish butter quotations.

40,029. (*Mr. Channing.*) Are the wholesale prices which you have given in your memorandum the prices in Denmark or the prices here?—These are the Danish prices converted into English currency.

40,030. Are they the prices in Denmark of butter before it is sent over here, or are they the prices in the English market?—That is not the price in our markets here; it is the price which is paid to the exporters on the other side. These are the published prices at which the butter is sold wholesale in Copenhagen; but presumably there must be a profit on that price or it would not pay the trade.

40,031. (*Mr. Lambert.*) I do not think you would find that the rates of freightage, the cost of transport, would fluctuate much otherwise it would disorganise the trade?—I have no information on the subject of the rate of freights at the moment.

Cork butter prices.

40,032. As I understand, you say that the Irish figures for prices of butter are much more complete than the figures which can be obtained in England?—There are more quotations made, but I think I understood from a Commissioner that the Cork figures were open to some challenge.

40,033. (*Mr. Little.*) The Cork record is a complete one. The prices are fixed as between the producer and the merchant, and they are so far a correct record; the exporter at Cork supplies butter to his customers in England at the prices fixed by the Committee; therefore the record is good, but the contention is that the prices are fixed with a view to benefit the trader rather than the producer?—I was not aware of the method.

40,034. (*Mr. Lambert.*) Did I understand you to say that it was difficult to get the accurate prices that butter and dairy produce were sold at in Great Britain?—It is. I have several times endeavoured to obtain a good record of the prices of dairy produce in this country, and there is at present no market record.

40,035. Then I understood you say that the record in Ireland was much more complete?—There, as I understand, more information is published of the market prices.

Major P. G. Craigie.
14 Feb. 1895.

40,036. Why cannot we get our figures as complete as the Irish figures?—I fancy it is simply that the importance of the trade in Cork has been such that they have published these prices more correctly. There has not been any like body interested in the trade to obtain these figures completely here. Probably the best figures we could get are the figures which are published in a newspaper such as the "Grocer" or some of those papers. Those papers have given at different times a number of quotations of Irish butter of different qualities, but there are no official quotations.

Prices of British dairy produce.

40,037. (*Mr. Giffen.*) You get the prices of the imports by dividing the values by the quantities and that gives you a figure on a large scale?—But that would not give you information of the prices of Irish produce in British markets. I have seen some individual compilations and figures kept by particular land agents, or particular persons interested; they are very interesting as far as they go, but they are purely local, and we have no averages from our markets here. The great objection to the returns which I have seen is the great variation in price between qualities and between one part of the year and another. In the case of the Danish figures everything is reduced to a system by these co-operative committees fixing their prices.

40,038. (*Mr. Channing.*) My point was whether or not it would be desirable, owing to the apparent opening there is for an extension of dairy farming in this country, for a more accurate and complete record of the prices to be obtained for British dairy produce?—I think it would be desirable if we could have such prices; but there would be this one great difficulty in regard to everything that differs much in quality, that a mere record of prices, unless it entered into the quality and description of the produce might be somewhat misleading.

Danish butter quotations.

40,039. (*Mr. Dalton.*) These Danish prices are the highest, are they not?—These prices that I have given here are the prices fixed weekly by the agent.

40,040. That is for butter of the best quality?—They must come up to the quality which would pass examination.

40,041. It is the average of the highest weekly?—Yes, practically.

40,042. (*Mr. Giffen.*) These are the prices, as I understand, at which the Danish producer sells his stuff to the wholesale merchants in Copenhagen, is that so?—The manner in which the trade is organised is explained in page 14 of the Report on Dairy Farming, to which I have referred. The trade really is arranged in this way. The English merchants and dealers on this side telegraph out their orders weekly to the wholesale exporters in Denmark, and the butter is sent off immediately on the following day by steamship. The freight is paid by the purchasers and the price is regulated by the Copenhagen quotation on the date of shipment. This arrangement has three advantages: there is no risk of the butter remaining unsold on the commission agents' hands because it is an order from this side; and the commission of two or three per cent. which used to be the agent's commission in former days has been saved, and quantities come in precisely to meet the demand which is known to exist on this side. The price is fixed by the committee consisting of a chairman elected by the association of wholesale dealers, four of the largest butter exporters, a local dealer, a butter broker, and a dairy farmer. The committee meets every Thursday to fix the wholesale price of the butter, and a fair price is arrived at after taking into consideration the quotations in foreign markets, and all other factors.

40,043. (*Mr. Lambert.*) What prices are those you are referring to?—The Danish prices.

40,044. (*Mr. Giffen.*) Then it is a price fixed by the people interested who regulate innumerable transactions of different kinds?—That is the object.

40,045. But it is fixed by a body which contains representatives of the people represented on both sides?—Yes, representing producers and merchants.

Prices of British dairy produce.

40,046. (*Mr. Lambert.*) But there is no method of getting at accurate figures in the metropolitan markets and the local markets of this country?—I think the great mass of transactions in regard to the dairy produce of this country are individual transactions and are not necessarily made in open market. Some are made in the market and some are made directly by the farmers with the shops in the towns to which they send their produce.

40,047. You have in every local newspaper the current quotations for dairy produce?—In many newspapers you see these quotations, but on what number of transactions they are based I have no explanation to offer, nor do I know how these quotations are ascertained.

Major P. G. Craigie.
14 Feb. 1895.

40,048. Then you get returns as the price of wheat?—By Act of Parliament under the Corn Returns Act of 1882.

40,049. If you get returns of the price of wheat why may you not get returns for the price of dairy produce, because even the quality of wheat fluctuates?—Undoubtedly the quality of grain fluctuates very much; but there are very old Acts of Parliament which fixed the liability upon the purchaser of corn to make a return, and there has been no such proposal, so far as I am aware, made in regard to dairy produce.

40,050. Do you think it would be desirable?—Statistically of course I should like to have the prices of everything if we could get them. It is a question rather for the Legislature, whether they would go so far as to compel that information being given.

40,051. Then the Legislature should be advised by people who have been interested in the subject, and who have made a study of it, as to whether it would be worth while to give the prices?—I am not prepared to give an official answer on the subject of the expediency of compulsion.

40,052. (*Mr. Giffen.*) The price of wheat, which Mr. Lambert refers to, is not a single market price in the sense of that market price at Copenhagen which you give in this return; it would be the consolidated price of wheat of all kinds over an immense area, and the price he suggests for butter would be a price of the same kind, would it not, unless you take some precautions to get different qualities represented?—They would be entirely different matters altogether. The local prices for butter such as those published in the papers would not give us an average.

40,053. It would not be a price corresponding to this price which you get in Copenhagen?—No.

Danish butter quotations.

40,054. But just a local price of a particular market?—That is so.

40,055. (*Mr. Dalton.*) According to the heading of the table these prices are the average prices of the finest Danish butter?—Yes, that is so.

40,056. Does this committee fix the average wholesale prices of a second class butter and a third class butter, and so forth, or does it merely fix the price of the best butter?—It fixes the price of the different classes of butter.

40,057. Then the finest really means the average butter?—It is rather more than that. The object, of course, of the Danish trade is to keep up the quality, and a very great effort is made to keep up the quality of their butter. If that butter is not up to their mark, it will not pass.

40,058. (*Viscount Cobham.*) They grade the butter, but only fix the price of the best?—Yes; they grade the butter and fix the prices of the different classes.

40,059. Is the export, do you suppose, confined to the highest grade butter?—I am not prepared to say that it is entirely confined to that, but certainly a large proportion of trade is conducted on this system, and one of the great features of the Danish trade is the great uniformity of the product that comes to this country from week to week.

Danish co-operative dairies.

40,060. (*Mr. Channing.*) I see you say that there are about a thousand co-operative dairies. Are there butter factories besides co-operative dairies or are those the butter factories?—I understand that the co-operative dairy is itself a butter factory.

Consulting dairy experts.

40,061. I want to ask you whether these articles of association have been the chief means of obtaining uniformity in quality, and appearance, and general saleability of the butter, or whether other steps have been taken to obtain uniformity?—I think the steps detailed here, of travelling expert advisers who are in use locally must be taken into account. They go from farm to farm, and point out to producers in what way they can manage.

40,062. That, you think, has been of very great value in obtaining uniformity?—Yes.

40,063. And the dairy shows also?—The dairy shows also by the competition provoked. Undoubtedly the advice given by experts has been found of very great value, not by the producers going to the school, but by the experts going to the farm.

40,064. Do they go to the individual farms?—I understand they go and give advice where required in different

Major P. G. Craigie. 14 Feb. 1895.

places. These men, are in the pay of the Government or in the pay of the Royal Agricultural Society, which is assisted by the Government.

40,065. Do they go manually and technically through the whole process of making the butter with these people?—Yes; the separator and various other aids are taught, and the use of the thermometer is explained.

40,066. Is that done in a more thorough way than is done by the system of lectures in this country?—I think individual advice is very often on many technical points a great advantage which we cannot give through a mere lecture to number of persons; the local visit shows what can be done on the premises of the man.

40,067. Do you think that is a much more effective method?—I think that as the actual manufacture takes place in those factories the instruction really is more on the primary conditions of keeping the animals and the preparing of the milk. The actual making of the butter is done in the factory. The duties of the consulting experts are mentioned on page 13. Upon application being made to the expert: "He shall assist by direct advice and actual "supervision the operations and processes of production "in the dairies, and shall assist local associations formed "with the object of promoting the dairy industry wherever "his assistance is desired." He keeps notes of all applications made to him and all applications for guidance on all doubtful matters and questions of administration must be addressed to the Royal Danish Agricultural Society; then any dairy association or individual farmer receiving assistance from the consulting expert must pay his expenses to and fro. (Appendix XXI., par. 30.)

40,068. If a similar organisation is attempted in England would you think experts of this kind would have a special advantage in this country?—The question would have to be considered how far the agricultural community generally would desire to have advice of that kind. Something of very much the same class has been conducted in the south of Scotland in connexion with some of the dairy associations there, where in the manufacture of cheese an expert lecturer has gone from farmstead to farmstead, and shown how the processes could be effected with the machinery which the farmer possesses.

40,069. Has that had good results?—That has had very good results indeed. It was originally the practice of some of the Southern Scotch Dairy Associations, assisted by the Board of Agriculture by grants. Now the work is done there chiefly at one large school, where the producers come for a short time to learn.

Danish butter exports.

40,070. There is a question I want to ask you about Danish butter; is it stored in large quantities and kept artificially for any length of time so as to get command of the English market in that way also?—I think, from the weekly arrangements that are described in the paper there is not any necessity for keeping any great store. The market seems to be regulated according to the weekly orders. The amount sent over is every week decided after the orders are received from this side.

40,071. Do you think those orders are supplied from freshly-made butter and not from butter kept in store for any length of time?—I fancy not for any length of time.

Tenure of land in Denmark

40,072. Has the alteration of the tenure of land in your opinion had any effect on the development of agriculture in Denmark?—There are a great many points in reference to that subject in Mr. Jenkins' report. He mentions there in what respects the alterations in the tenure have affected the matter. I have not included that in the memorandum, because I thought that was really before the Commission in Mr. Jenkins' report to the late Commission on the tenure of land.

40,073. Has there been a further development of the land tenure question in Denmark since 1882?—I am not in a position to give an answer to the question. As to the legal position I could not answer.

40,074. (*Captain Owen Thomas.*) What, in your opinion, is the position of the Danish farmers as compared with the English farmers; are they very much better off?—I have not myself been in Denmark; therefore I could not form any opinion except from the papers that are before the Commission. They certainly seem to be making a profit from their dairy produce, or it would not be continued.

Rents in Denmark.

40,075. Have you any idea what rents they pay there, or what rates and taxes?—The rent of land in Denmark is, I think, the subject of several paragraphs in this report of Mr. Jenkins. Taking individual cases the rents are quoted, I think, and the taxes; but I have not gone into into that subject for the purpose of this Commission. On pages 56, 57, 58 and 59 of Mr. Jenkins's report there is a good deal of information on that subject which is already in type.

Major P. G. Craigie. 14 Feb. 1895.

40,076. (*Mr. Everett.*) The general effect, I take it, in this report, of the changes that have taken place in Danish agriculture goes to justify the assertion that that part of a farmer's occupation which is most worth his while to cultivate is the four inches on the top of his head; would you not say that that is a short summary of the changes taking place as described here?—I think there is a combination of intelligence, education, Government assistance, and co-operation; there are four things at work.

Royal Danish Agricultural Society.

40,077. And the intelligence which has been quickened into new life was, in the first instance, stirred up by the Royal Danish Agricultural Society, according to page 3 of your memorandum?—The first steps were taken by that society undoubtedly. (Appendix XXI., par. 10.)

40,078. That, I imagine, is a voluntary society?—Receiving a great deal of assistance from the Government, and working in connexion with them. The Government aid is very largely administered, as is explained here, by means of the society.

40,079. Since that society stirred up in the matter State aid has, to some extent, supplemented what that society initiated?—Undoubtedly.

Education in dairying and co-operation.

40,080. It would look that if anything of the same kind is to be done in England it might start by our technical instruction classes, for instance, or our agricultural societies, which do receive funds from Government, which are in our hands to administer in this particular way?—I think that is so to some extent already; therefore it is in the same direction as indicated in this memorandum that efforts are being made in England by means of societies like the Bath and West of England, the Eastern Counties Dairy Institute, and British Dairy Farmers' Institute, and the different county councils' work. These various institutions are all engaged in the direction of imparting education in dairying. But that would scarcely bring about co-operation in the technical working; it would only be a means of imparting instruction.

40,081. That co-operation is a voluntary matter, I imagine?—Purely.

40,082. And so are the different agencies connected with it; so that it is quite open to our agriculturists to adopt the same co-operation with those adaptations suitable to our agriculture?—Undoubtedly.

Agricultural depression in Denmark.

40,083. But still, notwithstanding all the changes and improvements which have been made in Denmark, their farmers and their agriculture are in a state of serious depression?—The complaints are mentioned in the last paragraph of this memorandum.

40,084. Which depression they attribute to the continuous fall in prices?—And to the large increase of labouring wages, and, sometimes, to the difficulty of getting the labourers. I have seen complaints to the effect that people are drifting off, as with ourselves, into the towns, and the better class of labourer is not available in the country districts.

Agricultural wages in Denmark.

40,085. That is not mentioned in this memorandum, is it?—These are more recent remarks; I am merely supplementing what is mentioned here. The price of labour is mentioned as one of the difficulties, in the memorandum.

40,086. (*Mr. Gilmour.*) The rate of wage they are giving includes boarding allowances, does it not?—I think some do and some do not. There are two sets of figures given on page 17. The average daily wages are given in a separate table for the farm labourers without board, and the farm day labourers with board. Then again, farm labourers engaged by the year, are given separately. (Appendix XXI., par. 39.)

40,087. Do you say that these fellows who are engaged by the year only get 11*l.* 2*s.* 8*d.*?—They would be boarded.

40,088. These people engaged by the year are all boarded, are they?—I understand that those engaged by the year would be boarded by the farmer. That is the impression I have got from the figures.

Area of the United States.

40,089. (*Viscount Cobham.*) We will take now the memorandum of agriculture in the United States of America which was handed in by Mr. Elliott. (*See* Appendix A., XXI.) You began by giving us the extent of the States themselves, which, I think, is estimated roughly at 2,300,000,000 acres?—I have given the figures as they appear in the latest Census returns on that subject, and I rather put them in the forefront of the memorandum with the view of indicating how difficult it is to get really reliable figures as regards an area of such enormous magnitude and shewing such great differences of character.

Major P. G. Craigie. 14 Feb. 1895.

40,090. (*Mr. Giffen.*) Does that include the enormous areas in the Western States which is perhaps not suitable for cultivation at all?—A large portion of what are called the "Mountain States" is included by measurement in that area, much would not be suitable for occupation. I travelled through a considerable portion of the Rockies myself.

40,091. I used to have the figure roughly in my mind that the United States, with a total area of about three million square miles, excluding Alaska, had only about two million square miles suitable for occupation and cultivation, and that the other million square miles was practically a desert?—I think that that statement might require some qualification, because I remember hearing that stated some years ago, and certainly portions of Colorado, Arizona, New Mexico, and some of those districts which were practically desert have been made use of by irrigation to an extent which was never anticipated, say, ten years ago, and the same with parts of California, where I was last year.

40,092. Do you include the whole of that area?—The whole area, whether nominally suitable or not, is included in the total area that I gave, but many parts of that desert area are now certainly used to some purpose. What was once called the great American desert is not nearly so great as we once thought it. But still there is a very large portion of land quite unsuitable for agriculture.

Cultivable area of the United States.

40,093. (*Viscount Cobham.*) You take 1,900 million acres as practically the area which is capable of cultivation to some extent—omitting Alaska. That area is the subject of the inquiry in this memorandum, but it includes a great deal of land, as a Commissioner has just suggested, which would not be suitable for cultivation, and which could not all be cultivated.

40,094. (*Mr. Giffen.*) In fact a very large amount of land that would not be suitable?—Of two classes, mountainous land which is purely rock, and land which is too devoid of water at present, or without a large outlay on irrigation, but the American Government are making great efforts by means of inquiries into the use of artesian wells and otherwise to see whether some of the desert land not now used might not be cultivated. In California that irrigation system has been applied very successfully.

Changes in cereal areas of the United States.

40,095. (*Viscount Cobham.*) What have been broadly the general agricultural changes on this large area since 1880?—So far as the Census figures indicate it would seem that the whole grain-bearing area had increased about 18 per cent., half of that grain-bearing area carrying maize. Wheat which was formerly nearly a third of that area, covered less than half at the end of the Census period and has not increased since, according to the more recent figures of the department. Oats have shown a considerable increase, namely from 14 per cent. to 20 per cent., and there has been a distinct increase in the area carrying barley if we go further back, but in the Census period there is not any very great change in the area of any of the minor crops. One great feature has been the increase in the land used for grass—for hay—throughout the whole period. The latest returns on that subject come down to a later date than the Census, and indicate 48 to 50 million acres.

40,096. Taking the area under wheat, that if anything has diminished notwithstanding the very large increase in population of the States?—That is so.

Increase in population of the United States.

40,097. What has been the increase in population since 1880?—The increase in population of the States as a whole, between the two Censuses is given as from something over 50 millions to 62½ millions—12 millions, speaking very roughly, is the increase of population in the 10 years.

40,098. (*Mr. Giffen.*) And there is a doubt whether that figure of 62½ millions is not too little is there not?—There have been a great many discussions as to the accuracy of the figures, but I must go by the published figures of the Census.

Changes in the wheat-growing area of the United States.

40,099. (*Viscount Cobham.*) I see you have divided the whole area into three groups which differ considerably in the various proportions of the crops grown in them?—The principle of that division is in the first instance rather historical, I take the old United States, which were the 13 States that formed the Union at first, with the two or three States that were afterwards added to the North and South, and formed the old part of the country along the seaboard of the Atlantic. Then I take the Central States, including the whole basin of the Mississippi, not stopping at the Mississippi as some of the divisions do, but so as to get the best grain-bearing area; and then I take the whole of the western part as one. I found the figures would be conveniently compared in that way. An upright line between the whole west and the central and eastern divisions embraced what they call the area of settlement. All to the left, that is to the west of that central line in the year 1880 at the census before the last, had practically only two persons to the square mile.

Major P. G. Craigie. 14 Feb. 1895.

40,100. There has been a diminution of the wheat-growing area in the eastern section, I see?—In the eastern section the population has gained about four millions and the wheat area has fallen off in round numbers one million acres.

40,101. But the total amount of land in farms and land improved, has not varied much?—There is very little difference; the land in farms is practically the same.

40,102. That is practically the same?—Yes, there is no very great change on the whole area. The land improved is just about the same; there is not much difference.

40,103. In the central area, I see, the population has increased five millions?—That is so.

40,104. And the wheat has diminished by six and a quarter millions of acres, is not that so?—That is so; the wheat has diminished from 23 and a quarter millions to 17 millions according to the Census figures.

40,105. In that section also the land in farms and the land improved has not materially increased?—It has increased in both cases but not very largely, it has increased by about 10 per cent.

40,106. But the losses in these two sections have been practically made up by the gains in the wheat area in the western section?—Not entirely made up, but made up to within about 1,800,000 acres. In a map, which I have ventured to put on the memorandum, I have coloured the particular area where almost the whole increase takes place. It really was in North and South Dakota and in the States of California, Oregon, and Washington. These alone may be said to account for the additional area which the Western States display.

Wheat-growing in Texas.

40,107. (*Mr. Giffen.*) Is there any increase of wheat in Texas?—There is rather a diminution.

40,108. In spite of what Mr. Atkinson told us about the tne Panhandle of Texas?—The figures, I think, that Mr. Atkinson referred to were probably of a later date than the Census. I am speaking now of the Census figures. But even the Agricultural Department's figures, as regards Texas, show that in quite recent dates, from 1889 to 1893, there has been a falling off from somewhere about 600,000 acres, which was the amount returned in 1889, to about 430,000 acres in 1893.

40,109. (*Mr. Clay.*) That shows that wheat growing in Texas has been going off?—It seems to indicate, if the figures are correct, that there must have been rather a decline, certainly no advance up to that period.

40,110. (*Viscount Cobham.*) Mr. Atkinson also told us that the all-wheat growing system is rapidly coming to an end, and I gathered from his evidence that that would affect the production in Dakota very considerably?—It would undoubtedly.

Wheat-growing in the Dakotas.

40,111. But up to the present time the increase in the western section has been mainly due to the increase in the Dakotas?—It is so undoubtedly. The Dakotas are the centre where the wheat growing has increased. The figures for certain particular States and the Dakotas are given I think a little lower down on the memorandum.

40,112. Do you agree with Mr. Atkinson that the all-wheat growing system is now practically done—I think that was his expression?—Some of the very great improvements in machinery have enabled the large wheat farms to produce at a very low cost per acre, but certainly the tendency seems to be now that further producing on a large scale does not in the long run pay, although for a few years it pays very well. Dakota itself is altering in character very much apparently, judging by the later figures.

40,113. Would you anticipate rather a further decrease in the wheat production of the Dakotas?—Perhaps, the Dakotas are even too wide a term to use. I think that the increase of wheat growing in the Dakotas has followed the southern and the eastern frontiers, and has not extended over the whole of either of those two States. There may be still territories to the west and north-west of Dakota which no doubt could be developed if prices were sufficiently raised and would be brought into wheat growing. A considerable portion of those States seems still not settled and not developed. If I may, for one moment, go back to the figures for Texas I have them here now. The Census figures showed that in Texas there were 373,570 acres of wheat in the year 1879 and 352,477 in the year 1889, so that in the Census period there was a falling off of twenty thousand acres in Texas.

Wheat-growing in Texas.

Major P. G. Craigie.
14 Feb. 1895.

40,114. (*Mr. Giffen.*) So that in every way you put it, whether you take the Census figures between 1879 and 1889, or whether you take the later figures of the Agricultural Department between 1889 and 1893, there is rather a decrease of wheat growing in Texas?—That would seem to be so. Of course Texas is an enormous area quite as large as France—rather larger I think, and something like the German Empire. No doubt there has been a development of some parts of Texas in different directions, and it may be quite possible that there may be an increase in some parts of Texas with the State as a whole not showing precisely the same result. The figures, I think, are given in the statistical abstract of the United States for individual States.

Changes in the wheat-growing area of the United States.

40,115. (*Viscount Cobham.*) The general effect of your comparison of the year 1890 with the year 1880, is that there would appear to be, according to the last Census, nearly two millions fewer acres of wheat grown altogether, although there were twelve million more consumers of bread stuffs in the States in 1890, than in 1880?—That is the general result.

40,116. Would that not point to a large diminution in the export of wheat?—I proceed to deal with that a little later on. On page 4 of the memorandum, I have given for every year since the Census of 1880 the official record of production and export. That shows, although there have been considerable fluctuations, that over the whole of that period, the export, on four occasions only, fell below four hundred million bushels, and on four occasions exceeded 500 million bushels; then the great crop of 1891, which was quite exceptional, was the only case where the wheat produce went above 600 million bushels. (Appendix XXII., par. 15.)

Exports of wheat from the United States.

40,117. There seems to be little or no falling off in the exports?—I beg your pardon, I am referring not to the exports, but to the aggregate production. The export has risen from 186 million bushels to 192 million bushels at the latter period.

40,118–9. (*Mr. Lambert.*) That is only up to 1892?—That is the crop up to the 30th of June in the year following 1892. The first column gives that crop year, and the export year is the year following, so that really the figures in the line 1892, are for the year up to the 30th of June 1893. The exports of the year ending 30th June 1892 stand opposite to 1891. In that year 226 million bushels appear to have been exported. These exports were undoubtedly affected by the great crop of 1891.

40,120. But you can bring here nothing later than the crop of the year 1892, although there are two years since that, in which the exports may have shown a fluctuation either way?—We can of course tell what arrivals there have been in this country, where the greater part of the wheat comes up to a more recent date. We can tell that up to the 31st of December last; but the exports from America, as published officially in their own reports, do not enable me to bring them down to a later date than the 30th of June 1893.

40,121. (*Mr. Giffen.*) Are there not figures to the 30th of June 1894?—They are not yet available in either the statistical abstract, or the Agricultural Department's figures, but I have no doubt they have been published; the Treasury figures I believe are published.

40,122. I think I can give them to you?—I think the figures are available, but they are not in the reports I am quoting.

40,123. (*Mr. Lambert.*) How do these figures compare with the figures published in our statistical returns of the imports from America?—That is shown on page 5. (Appendix XXII., par 16.)

40,124. (*Viscount Cobham.*) Neither there, nor elsewhere, can I find that there is a very material reduction of the export from the United States, notwithstanding the diminution of the wheat area and the increase of the population there?—You can find from the table on page 5 what we have received here from the United States over the whole period of years. It has fluctuated between 31 million hundredweights, and the exceptional importation of 1892, which was 61 million hundredweights. (Appendix XXII., par. 16.)

40,125. I think the last two years have shewn the largest importation we have had during the whole period?—Yes; and obviously affected by the huge crop of 1891.

40,126. But even setting those two years apart the figures are very fairly constant?—They have been.

40,127. We have 45 millions in 1881 and 43 millions in 1891. The figures seem to vary regularly?—Yes, with the annual surplus.

40,128. (*Mr. Lambert.*) Cannot you bring those figures down to 1894?—Yes, the figures could be brought up to 1894. The returns are published now, and we can tell exactly what the figures are, taking the year ending 31st of December last. With regard to the total imports, the conversion of wheat flour into wheat is not yet officially published, but taking the wheat in grain alone in the last three years of 1892, 1893, and 1894, the total imports into this country were 65 million hundredweights, then 65½ million hundredweights, and 70 million hundredweights. These are the figures for wheat alone without flour.

Major P. G. Craigie.
14 Feb. 1895.

40,129. They have actually increased according to that very considerably?—They have increased, but the portion coming from the United States of America has decreased, the amount being 33,800,000 in 1892; 32,300,000 in 1893; and only 24,600,000 last year from the United States. The amount of flour from the United States has also decreased quite lately. These figures can also be ascertained precisely from the monthly accounts of the Board of Trade up to date.

Extension of the area under oats and grass in the United States.

40,130. (*Viscount Cobham.*) What has mainly taken the place of wheat in the United States?—A very large extension of the oat crop is one of the features of the whole period under review, and also a considerable extension of the land used as grass, that is cultivated grass.

40,131. How has that affected the agricultural exports to this country from America?—In the shape of a larger increase of meat and animal produce. I think the oats and the maize and the grass are very largely used for the feeding of animals, and are exported in that form.

Exports of live-stock from the United States.

40,132. That is shown at the bottom of page 5, I think?—At the bottom of page 5 we show the number of animals, and we also show on page 6 the beef products and the pork products, which are the largest animal products that are exported. (Appendix XXII., par. 18.)

40,133. I see that the exports of cattle in 1884 were 191 as against 287 thousands in 1893?—In reference to that figure for 1893, I should point out that that was an exceptional year; the year 1894, which is now complete, will show no doubt a larger figure.

40,134. (*Mr. Giffen.*) Are these calendar years at this point?—The exports from America are not given for calendar years; the exports from America are given in the American figures taken up to each 30th of June.

40,135. Then the table at the bottom of page 5, showing the exports of cattle, sheep, and swine, are for the last year, as for the year ending the 30th June 1893, is that so?—Yes. The year ending the 30th June 1894, will show an increase upon that. In the same way with the figures at the top of page 6, those are published from the American official return, the object of that being to take the exports to all countries, and not the exports merely to this country. (Appendix XXII., par. 25.)

40,136. (*Viscount Cobham.*) The increase in the export of cattle, I see, has been more than counterbalanced by the falling off in the export of sheep and swine?—The export of sheep is a very small matter, because there is no export of the dead product of a sheep; scarcely any mutton comes from United States; whereas cattle come very largely in the form of dead meat.

40,137. Still in 1884, 274,000 sheep were exported as against 37,000 last year?—Quite recently, since these figures were received a great change has taken place, and this country has had nearly 200,000 sheep, so that a new sheep export trade is springing up quite recently with America.

40,138. (*Mr. Lambert.*) How are those sheep brought in?—By ship.

40,139. Alive?—Alive.

40,140. And killed at the port of landing?—Not sheep necessarily, as at present cattle are.

40,141. (*Mr. Long.*) They are imported and sold alive, are they not?—Yes.

40,142. And scattered about the country?—They may be, or they may be killed, but as a rule these sheep may be scattered about the country.

Exports of beef and sheep from the United States.

40,143. (*Viscount Cobham.*) In addition to the increase in the live cattle, there is an enormous increase in the exports of beef as canned meat, is there not?—That is so. Stated roughly, the beef exports may be shown in equivalent numbers. I find at the beginning of the period, taking the live cattle and the cattle shipped in the shape of dead meat, that the American States as a whole exported half a million, and they now export one million. The beef exports of the States have just doubled, taking the number of alive and dead. As regards sheep it is a very small matter, because there are no dead products, scarcely any mutton.

Major P., G. Craigie.

14 Feb 1895.

40,144. (*Mr. Everett.*) Within how long a period was that doubled?—In 10 years.

40,145. (*Mr. Lambert.*) Is there any danger of disease from these sheep being scattered about the country?—Of course all animals are inspected at the port, and in any case of disease, say sheep scab, or any other disease of an infectious character, they would be slaughtered at the port.

40,146. Are you making that assertion with confidence as to its accuracy?—The question of the administration of the Diseases of Animals Act does not come under my personal knowledge at all.

40,147. Exactly, that is why I have abstained from asking any question on the subject?—I have no knowledge of any recent change of the regulations upon the subject.

Exports of hog products from the United States.

40,148. (*Viscount Cobham.*) Then what have you to say about the export of hog products in the same period?—It does not seem to expand. The hog products exported from America, previous to the period dealt with in my table, were very much greater than the more recent supplies.

Exports of all agricultural produce from the United States.

40,149. Have you got with you the total figures of agricultural imports into this country from the United States during this period?—The total of agricultural exports from America are given only in value and not in quantity, and therefore comparing the two periods would be rather misleading, because of the great change in the value of breadstuffs. To give you the actual figures for the year referred to ending the 30th of June 1892, 800 million dollars worth were exported.

40,150. To England?—No, to all countries, of the cattle the total exports were worth 35 million dollars of which this country took 34 millions, and in 1893 they were worth 26 million dollars of which this country, Great Britain, took 25 million.

40,151. Can you give us a comparison with 1881 or 1880?—I am afraid the American figures do not give them for Great Britain in the same year—not without taking them out separately, I can give the total exports for that year.

Production of wheat and meat compared in the United States.

40,152. (*Mr. Giffen.*) Would it be a correct description of the agriculture of the United States in the last 10 or 20 years, to say that the principal features have been the diminution of the area under wheat upon the whole, consisting of a large diminution in some parts of the States balanced by an increase in other parts, but still leaving a diminution on the whole, and along with that a very large increase in the price of cattle. Would you consider these the two principal features of the development of the United States' agriculture?—I think that would be nearly a true description. The development in the cattle has not been quite uniform over the whole period, there have been considerable changes in the rate of growth.

40,153. The development seems to have gone on according to your figures, looking at the table now at the top of page 5, between 1870 and 1890, but since 1890 there has been no great increase in the number of cattle, although up to that date you seem to have had a very large increase indeed?—That is so. I have prepared a chart to show in rather graphic form exactly what the increase of each class of cattle has been in America compared with the increase of population (*producing diagram*). (Appendix XXII., par. 19.)

40,154. That is to say, there has been not only an increase of cattle, but an increase per head of the population of the United States?—Not entirely so, because, as pointed out on page 5, if you take the milk cows those milk cows are not so many per thousand of the population as they were in the earliest year, when they were 261 to each thousand, while they are now 245. If you take the other cattle they developed very rapidly as the diagram shows, up to a certain period after the opening of the ranch industry, and then apparently the numbers are checked and the figures draw back. (Appendix XXII., par. 20.)

40,155. Large as the increase is, it has not been quite in proportion to the increase in the population of the United States?—And the check which has recently occurred in the number of cattle, which is the only thing which prevents me answering the question of the Commissioner in the affirmative, is very distinct in the later years. In 1893, which I have given the figures for here, the "other cattle," which are the ones on which the export rather depends, were not quite 36 millions.

45,156. But subject to these qualifications which you have stated, if you took a survey over a long period, it will be seen that along with the stationariness or even the decline in wheat there has been an enormous increase in the numbers of cattle?—Certainly in particular parts of the United States.

Major P. G. Craigie.

14 Feb. 1895

40,157. But as regards sheep, you have not altogether had the same proportion of increase?—In the case of sheep, there has been an increase up to 50 million, and then a very considerable decrease, and that decrease is going on apparently. The later figures which have been telegraphed over here only yesterday, and which are the figures for 1895, show that both cattle and sheep are distinctly decreasing as against last year.

40,158. At the present moment a decrease is going on in both cattle and sheep, do you say?—A decrease is going on.

40,159. I think your figures as to swine show that while the swine increased between 1870 and 1890, much the same as cattle did, if not to a still greater extent, yet, since 1890, there seems to be rather a falling back again in the numbers of swine; is that going on at the present moment too?—That is so, and the number by the latest telegrams shows a still further decline—about another million.

40,160. Still, apart from this setting back in the last two or three years, would it be true to say that, putting cattle and swine together, there has been an enormous increase in the supply of meat in the United States?—There has been a large increase certainly.

40,161. But no such increase in the supply of wheat?—Nothing of the kind at all—it is not parallel in any way, still the surplus of wheat has been sufficient to enable them to export all the period through; there has never been a deficiency of wheat, but there is a loss a wheat acreage.

40,162. (*Mr. Lambert.*) In the returns that are telegraphed over, in which was the decrease most marked—in cattle or in sheep?—The decrease in cattle has been from 36½ million to 34⅓ million, and the decrease in sheep has been from 45 million to 42 million—assuming the correctness of the telegraphed figures; the decrease in swine has been from 45 million to 44 million.

Prices of wheat and meat compared in the United States.

40,163. (*Mr. Giffen.*) So far as the United States are concerned, although the decrease in prices has been greater in the case of wheat than it has been in the price of meat, that has not been in consequence of the extension of the production, but it has been coincident with rather a decline in the area under wheat?—Yes that is so.

40,164. In meat where there has been an enormous increase of the production you have had no such decline in price?—I think there has been a decline in price, but nothing of the same dimensions.

40,165. Nothing to compare with the decline in wheat?—Nothing of the same dimensions.

40,166. Then if anything of a similar kind—and I am going to ask you some questions about it—has been going on in other parts of the world we can only account for the less decline in the price of meat by supposing that, somewhere or other, there has been a great increase in the consumption of meat such as we have not had in the consumption of wheat?—That I think must follow—it must be.

40,167. There is a real connection between the two things?—The figures certainly suggest that.

40,168. That that is likely to be the case?—The figures certainly suggest that.

Exports of live-stock from the United States.

40,169. (*Mr. Lambert.*) Upon those figures you would naturally anticipate a lessoned export from the United States of meat, or of cattle and sheep, because they have a less number of sheep and cattle there?—I think my answer would be that the per-centage of the whole of the cattle and the sheep supply in the United States which is exported, is so very small that the change in the total numbers can hardly affect the export as yet. It is not more, at the outside, than three per cent. in the case of cattle.

Improvement of quality of live stock in the United States.

40,170. (*Mr. Giffen.*) Is there any improvement in the quality of the live stock of the United States, do you think, which would give us a greater quantity of meat from the same number of stock?—I think that must be so if you compare with a period some distance back. I do not think that increase in quality has been going on quite so much in recent years, as it was up to a short time ago, but certainly there has been, compared with a number of years ago, an improvement in the class of stock.

40,171. Might we assume that the same number of stock now gives a greater supply of meat than what that number of stock gave in 1870? I think that they would mature sooner; my impression is to that effect.

Major P. T. Craigie.

4 Feb. 1895.

Exports of wheat from the United States.

40,172. With regard to the exports of wheat from the United States, about which you were speaking some time ago, you did not give us the figure for the year ending 30th June 1894, I should like now to put into your hands an official statement from the United States showing their exports for the year ending 30th June 1894; and I should like to ask you whether that does not show that the exports of wheat in that year, ending 30th June 1894, were not 88 million bushels of wheat and 17 million bushels in round figures of wheat flour; and that would represent approximately, I think, about 110 to 115 million bushels of wheat to compare with these figures which you give us on page 4 of your statement?—That is so, adding the wheat flour; that has added nearly a third to the amount. (Appendix XXII., par. 15.)

40,173. So that the export of wheat from the United States in the years 1891 and 1892 was rather exceptional; and now the export is brought back to the figures which are much more common in that table which you give us?—I think there is no doubt of that fact, and the explanation is quite apparent; the enormous crop of the year 1891 which affected the exports both of that year and of the following year.

Production of wheat and meat compared in the United States.

40,174. I should now like to ask you some further questions with reference to that point we were on before we went to lunch, that is to say, the falling-off in the acreage of wheat in the United States, and the great increase in the number or cattle and the number of swine, and some increase in the number of sheep. I should like first of all to ask you whether you have not written at different times on subjects connected with agriculture.—I have here before me two papers of yours, which you contributed to the Journal of the Agricultural Society, one of them "Twenty Years' Changes in our Foreign Meat Supplies," and the other, "The Growth and Development of the Trade in Frozen Mutton." Have you those pamphlets with you?—Yes.

Wheat acreage of the world and the increase of population compared.

40,175. I should like to ask you, having regard to the evidence which you have given us about the United States, and having regard to the figures in these two papers which I refer to, whether you would not be justified in saying that that stationariness in the acreage under wheat is not only characteristic of the United States, but is characteristic of the wheat acreage generally throughout the world putting all countries together and how far that would be so?—In those papers which I have written. I do not refer to the wheat acreage.

40,176. You do not refer to wheat acreage so much; but I am asking not only with reference to these papers but with reference also to your knowledge of what is going on in foreign countries generally, and with reference to these statements which have been put in by Mr. Elliott and which relate not merely to Denmark and the United States, but to the countries of Europe generally; so that you might be able to make some general statement. Do you think it would be true that the increase in the acreage under wheat has been less or more than the increase in population of the people who consume the wheat?—The figures that have been put in with reference to the areas of wheat show a very slight increase in the case of Europe. Those figures which have been put in only deal with Europe.

40,177. And they show a slight increase in the case of Europe?—Yes, a slight increase.

40,178. And not at all in proportion to the increase in the population of Europe?—Certainly not in the case of Europe; but when you go beyond Europe, and ask what the wheat acreage of all the countries in the world is, I must express a little hesitation in coming to any definite conclusion, because we have not got any reliable figures of area from many countries, and all populations are not wheat consumers.

40,179. The increase of population in the United States is more than the increase of wheat area in the United States, is it not?—Undoubtedly.

40,180. And the increase of population in Europe is more than the increase of wheat area in Europe?—Certainly.

40,181. Then if there has been any increase in the wheat area at all of a remarkable kind, it must have been in countries outside these two areas which we have mentioned?—There is nothing very accurate available, but the increase must have been outside.

40,182. Is that quite so; have we no accurate figures as to the acreages in the Australian colonies?—With regard to Australia we have the figures, which are presumably exact, but small. I have the figures here.

40,183. And the Argentine Republic?—I am not quite sure that we have very accurate figures from that quarter.

Major P. G. Craigie.

14 Feb. 1895.

40,184. The only other important country, I think, is India?—The Indian figures we know pretty fairly.

40,185. There has been no great increase in the area under wheat there?—Certainly not.

40,186. So that it is a reasonable thing to say that, probably, apart from the Argentine Republic, there has been no great increase of the wheat area anywhere, and apparently no increase to correspond to the increase of the wheat consuming populations of the world?—That certainly is the impression which the partial figures that we can get makes upon my mind.

Increase in the numbers of cattle and sheep in the world.

40,187. Passing on from that, to compare these United States figures with what is happening generally in agriculture, would it be true to say that not only has there been a remarkable increase in the numbers of cattle in the United States, but in almost every country in the world there has been an increase of some kind, and in some countries as well as the United States there has been a remarkable increase?—I think that was so, at all events, up to a comparatively recent period. I think there is now a check in a good many countries.

40,188. There may be a set back just at this moment, but until a comparatively recent period that would have been a true description of the development of agriculture, not only in this country and in the United States, but almost everywhere?—As regards cattle, that was the impression I got in going into the matter some years ago, I have not specially checked the figures lately, but I know there has been a slight decrease in certain countries recently.

40,189. I think it appeared from that paper which I speak of—the "The Twenty Years' Changes in our Foreign Meat Supplies"—that as regards sheep, even, you had then begun to observe that there was no increase of sheep in European countries, but rather a fallingoff?—That is so.

40,190. And that the increase of sheep was mainly in the Australian colonies and in the Argentine Republic?—I pointed that out in 1887.

40,191. There has been no great increase in the United States, but that is, broadly speaking, what has happened as regards the meat supply?—Certainly the increase of sheep has not been in any way parallel to the growth of cattle.

40,192. And in Europe there has been no increase of sheep at all, but a decrease?—A serious decrease, as shown by the figures put before the Commission.

40,193. But whilst the facts are so as to the increase of cattle and the increase of sheep, would it not also be true to say that in the period under review, say the last 20 years, there has been a great change in the accessibility to markets of great numbers of sheep and cattle that at the beginning of the period had hardly a market at all as meat, but now have a very important market in consequence of changes in shipping and changes in refrigerating processes?—That is so, no doubt.

40,194. And that applies especially to New Zealand, which has been able to send immense quantities of frozen mutton to this country?—And to the Argentine Republic, from which large quantities of sheep have come.

40,195. So that we have had an immense increase in the number of cattle, we have had some increase in the number of sheep, and simultaneously with those two things we have had a great difference in the accessibility to markets of immense numbers of both cattle and sheep, especially sheep?—Yes.

40,196. So that if the price of meat has been kept up along with this immense increase of supply, there must have been a very considerable increase of consumption somewhere?—That is the impression that one must take from the figures.

40,197. I do not know whether you are able to give us any figures, whether you are at liberty to give us any figures, or have the things in a state to give us, but could you tell us from your knowledge generally whether there has not, in point of fact, been a great increase in the consumption of meat in this country during the last 20 years?—Such calculations, and they are perfectly unofficial estimates, as I have been able to make certainly tend to show that there has been a very considerable increase up to at least two or three years ago.

40,198. You have had some increase in the numbers of cattle in this country?—Some increase, with a decrease last year here as elsewhere.

Major P. G. Craigie.
14 Feb. 1895.

40,199. But coincident with that, you have had an enormous increase in the imports of meat of different kinds, which you can measure because you have got the weights stated, is that so?—Yes, that is so.

Consumption of meat in the United Kingdom.

40,200. Therefore you are able to say with some amount of certainty, that there has been an enormous increase in the consumption of meat per head in this country?—There has been an increase, I do not know whether the word "enormous" exactly describes it, but there has been a large increase undoubtedly up to about two years ago. In the last two years apparently the same figures have shown a check.

40,201. Would you be prepared to name a per-centage of increase per head?—My impression is that, taking single years, we have got from about 104 lbs. per head to something like 120 lbs. per head—rather more.

40,202. In the last 20 years?—Taking a period from 1868-9.

40,203. (*Viscount Cobham.*) Does that include bacon?—It includes all pig meat—every form of pork or bacon.

40,204. (*Mr. Giffen.*) That is chiefly the increased importation that you speak of?—That is chiefly the increased importation.

40,205. There has been some increase in the home supply, but it is mainly an increase of importation?—Yes.

40,206. So whatever doubt there may be as to the amount consumed per head 20 years ago, and the amount consumed per head now, there is comparatively little doubt about the increase?—I think there can be very little doubt about there being an increase, whether it is exactly 20 per cent. or what the figure may be is a matter of doubt. I should like to point out that although I have, as you say, written on this subject, I have been more than ever convinced of late that it is a mistake to take the figures of any two single years as representing what that increase is, because the estimates of production depend upon certain deductions as to the number of cattle going to our markets out of the herds every year, and although we may for statistical purposes take a certain percentage practical farmers know that it is not always true that you sell the same amount of meat off every year. I prefer to take groups of three years, and then I think the same general impressions would be conveyed, an increase up to about two years ago, and then a decided check for the last year or two.

40,207. You have looked at what is going on in foreign countries as well?—I have both in France and elsewhere.

Consumption of meat in the United States.

40,208. Do you think you can say that there has been any increase in the consumption of meat per head in the United States?—The estimates are so very uncertain that it is very difficult to form an impression. I have a statement by one of the American secretaries of agriculture that the estimate for that country was 150 lbs. per head about five or six or seven years ago, if so, that is a very much higher rate than ever obtains on this side of the Atlantic, but there is no comparable figure to show the latest estimate from American authority.

40,209. You are not able to name any figure?—I cannot name a figure.

40,210. You think it probable there has been an increase?—I think it is just possible, but there is an enormous waste as well as consumption of meat in America; it is very difficult to form an impression.

Consumption of meat in France and Belgium.

40,211. Can you tell us about the consumption of meat in continental countries; would you say there has been some increase in the consumption of meat per head in France?—Certainly in France there has been some increase, and I should imagine an increase in Belgium.

40,212. How much per head in the last 20 years would you say?—I am afraid I could not venture on an actual figure. I have referred to some figures in my paper on this subject.

40,213. That is what I have observed?—I am not able to continue that figure without further inquiry. My impression, speaking broadly and generally, is that there has been some increase, although not perhaps the increase we have had here.

Consumption of meat in Germany.

40,214. Has there been any increase in Germany, do you think?—I rather imagine there must have been an increase, but that is on very general grounds, because I have not sufficient detail as regards Germany. As regards France I might perhaps supplement my answer by saying—of course it is known to the Commission—that there has been a very large increase in the French importation of live animals, and some of dead meat, within a very recent period in spite of the very heavy duties, which seems to indicate a larger consumption.

Major P. G. Craigie.
14 Feb. 189

40,215. Looking at the facts generally, at the stationaryness of the acreage under wheat on one side and the increase of the numbers of the cattle on the other side, and the undoubted increase in the consumption of meat in this country, and the probable increase in the consumption in some other countries, would it be a fair inference, do you think, to say that probably one reason for the decline in the price of wheat is stationaryness of the consumption, that consumption being checked lately by the consuming people taking meat instead of wheat?—I think it is very probable that something of the sort has happened. I would even go almost further and say that the figures rather suggest a decreased consumption of wheat than a stationary consumption of wheat. I know that impression is held in some other countries besides our own.

Consumption of wheat and meat compared.

40,216. So that wheat as compared with meat is in an especially weak position, because for various reasons, of which the consumption of meat may be one, there is not an expanding market for wheat?—I think so; that is my own impression, certainly.

40,217. And the article of agricultural produce for which there has been an expanding market is meat?—That is certainly my own impression; but I should like to say to Commission that in giving these personal impressions I am not expressing in any way any official opinion, because the matter has not been the subject of distinct inquiry or investigation. It is merely an impression from the figures before me.

40,218. I quite understand that; we are getting the figures before us, and I am endeavouring to put the figures together and asking you what are the apparent inferences reasonably deducible from those figures, which are not official calculations in any way?—That is so.

40,219. Can you form any idea as to what the course of development of agriculture in these matters is likely to be in future; first, as to theincrease of supply of meat on one side, and next, as to the increase of the consumption of meat upon the other side?—I do not think I could answer that question as to the future course of matters. I should prefer rather to deal with what we have before us, that there has been some increased consumption of meat.

40,220. You have mentioned to us that as far as you can observe there is a setback as far as the supply of meat is concerned, in certain countries; that in the United States the numbers of cattle and the numbers of swine, and the numbers of sheep even, have not been increasing in the last two or three years?—That is so.

Production of cattle and sheep in South America and the United States.

40,221. Are you aware of any increase in any other directions to set off against that?—The figures that we have from the Argentine Republic, such as they are, seem to show an increase of sheep in that district certainly, which will go to balance the losses of sheep elsewhere, so far as it goes.

40,222. Is it not the case that the United States, looking at it as an agricultural country, as one farm as it were, is much more fully occupied than it was 20 years ago, and that there is not the same room for development of agriculture of an extensive kind that there was 20 years ago?—That is undoubtedly true; but still there is a great deal of room, though not as much as there was.

40,223. Is it not likely that you could have the same development in the numbers of cattle in the United States in the next 20 years, say, that you have had in the last 20 years?—I think it is an arithmetical fact that the area is not such as to enable an illimitable development of cattle to be made.

40,224. Is there any other area in the world that you know of like the United States. As far as the development of cattle and sheep is concerned?—I am afraid that our information, although we have endeavoured to get it from different quarters, is not sufficient to enable me to say what may yet be the development in South America and in Africa.

40,225. The Argentine Republic is a much smaller place than the United States?—But I think there are other parts of South America which may develop cattle.

40,226. What parts?—Possibly Uruguay.

40,227. But Uruguay is a very small place indeed?—It is a small place, but there appears to be a possibilty, I am merely now speaking of what I do not know rather than of what I do, but there are similar countries where conceivably cattle keeping and sheep keeping may develop, such as parts of Africa.

40,228. You agree that it is a fair case for inquiry whether there is room throughout the world for the expansion of cattle that there was 20 years ago, say, that

Major P. G. Craigie. 14 Feb. 1895.

is a fair subject for inquiry?—Certainly, as the world does not grow larger, and the people on it grow more, there must be less room than there was.

40,229. Then it is a fair case for inquiry whether we are likely to have the same increase in the supply of meat in the next 20 years as we have had in the last 20 years?—It is a question for inquiry, undoubtedly.

40,230. Then from what you have observed, is there any room to be compared with what there was 20 years ago for improvement in refrigerating and other processes by which meat is brought from a distance to the countries of Europe where meat is consumed?—It is always very difficult to place a limit upon the ingenuity of man.

Cost of carriage on mutton from New Zealand.

40,231. What is the expense per lb. of bringing mutton from New Zealand now, would you say?—The expense must be very small if the trade is to continue looking at the price per lb. realised.

40,232. Is it not more than a penny per lb.?—I have not the figures before me recently, but certainly some years ago it was more than that when I made inquiry in 1889.

40,233. About 1¾*d.*?—I think about 1¾*d.* or 2*d.*

40,234. And now it is probably something less than that?—It must obviously be less at the price at which the trade is going on.

40,235. Therefore, as far as these processes are concerned, there is not much in the present price of meat for a diminution of price to be effected by improvement in these processes?—Apparently not, but that again is assumption; we do not see any reason to suppose it.

40,236. Still these are fair matters for inquiry now?—Perfectly so.

Consumption of meat.

40,237. The thing having been brought to this point, that the important question in agriculture is the future supply and the future consumption of meat?—That is certainly a more important question than almost any other.

40,238. You can give us no information as to the likelihood of an increase of the consumption of meat in any country; your attention has not been called to any circumstances likely to enable you to throw light upon that question?—I cannot at the present moment make any statement on it.

40,239. (*Mr. Long.*) I want to ask you one or two questions with regard rather to general impressions than really with reference to the figures. Some evidence has been given before the Commission here by which it has been attempted to show that farmers in the United States of America are not only far more prosperous than the farmers in Great Britain but that they are actually making, as a general rule, very large fortunes; did your experience during your examination of agriculture there confirm that view?—I think that the question referred to perhaps related to certain portions of the United States, not to the United States as a whole. It is rather difficult to answer the question as to the whole area of the States.

Condition of farmers in the United States.

40,240. The evidence given before the Commission rather applied to the States as a whole generally speaking, and was a comparison between the agricultural position of the tenant farmer in England and the agricultural position of the cultivator of land in the States?—I think I may say this, that I heard many complaints during my stay in the States as to the poverty of a large portion of the agricultural population, and as to the distress which existed in certain districts, but it would be almost impossible to form a general impression as to whether there may not be local exceptions to these complaints. In certain districts people have done very well indeed; it must be so, or the production in the form in which I have given the figures could not have continued; someone must have been doing well.

40,241. But would not that be equally applicable to agriculture in England; is it not the fact that even in these bad times there are some men in particular districts who, either owing to their own special aptitude in their business or other circumstances, have done well even in the bad times?—That may be to some extent, but in a country where agriculture in one form or another is expanding, although the wheat area is not expanding, there must be a profit in the industry or people would not be tempted to go into it and to take up new land. In the case of English farms we have few instances of new land being taken up. It is obvious from the figures which have been put before the Commission that land is still being taken up in America in certain districts and for certain purposes, and even now at present prices, although not to the same extent as formerly. Therefore someone must be looking for profit. But there can be no doubt at all that in many parts of the States matters have been very difficult indeed for the agriculturists, and that has been found apparent in many complaints of depression there as elsewhere.

Major P. G. Craigie. 14 Feb. 1895.

40,242. Do you think that the profits which producers of corn and producers of meat, as opposed to the middlemen, are making in the States now are such as to justify a continuation of the competition on its present lines?—I think the whole tendency of the evidence that I have given here and in the memorandum, which has been put before the Commission, and particularly in the notes which I have appended as regards certain States—Iowa, Illinois, and the New England States—tends to show that the character of American agriculture is changing very rapidly, and probably changing because of that very circumstance that the profits of grain and grain growing are not what they were, and do not promise continuance.

Burdens on land in the United States.

40,243. When you were there, did you hear anything of any burdens upon land?—I think one always hears complaints of taxation in nearly every State you enter, whether it is Denmark—which we were referring to this morning—or the United States. I do not think the burdens are very heavy in many cases in America, but undoubtedly complaints of taxation have been urged, and urged on these grounds, that they considered that real property, which as well as personal property is assessed there, paid more than its share. I heard that in several cases.

Mortgages in the United States.

40,244. Did you hear of any other burdens on the farmers in the shape of mortgages?—That question is very prominently discussed in many districts, but it has been the subject of formal official reports in the Census, which I dare say are before the Commission.

40,245. Did this point come under your notice?—My stay was much too short to enable me to make any personal investigation of this. One hears constant complaints of mortgages pressing hard upon owners of land, and on different farms, both chattel mortgages and crop mortgages as well as others.

40,246. I mean in the United States?—In the United States, in some districts undoubtedly, there has been very much complaint from that cause In other cases the general figures published by the Census authorities were rather re-assuring, showing that the mortgages in some districts were being paid off so far as recorded.

40,247. But you did not inquire into the question of mortgages?—No, that formed no part of my inquiry.

40,248. Are you aware that some people hold that the agricultural distress of this country is to some large extent due to the difficulty of the adjustment of rent as between owner and occupier?—That has been stated.

Tenant-and-owner farming in the United States.

40,249. Did you find that the absence of any landlord in the greater number of agricultural holdings in America produced a proportionate advantage to the occupier of land?—What struck me more than anything else perhaps in my last visit to America, was the growth of the landlord; and that many more farms were rented than were rented when I was there before.

40,250. What cause has led to that do you think?—The forces leading to it were rather complex. Where men had made money on their farms, and were anxious to have a better education and living for their children they moved into the towns and let their land; I found that in many cases. Also where men had sons coming on, they put their sons on their farms, took a nominal rent and retired; that is, where the land had been occupied for some time. In the south there has been a large development of what we call tenant farming, owing to the circumstances that followed the abolition of slavery, where something almost like the French system of Metayer-holding, share holdings, in which the tenants pay in produce, was adopted. The figures, which are published in the last Census return, certainly show that there was more hiring of land in America than there had been before; and that circumstances were tending in that direction.

40,251. And that is, as you say, on the increase?—That is rather on the increase. I gathered that impression from figures which were pretty reliably collected.

40,252. Did any cases come under your notice where a man being the owner of his own land in America and having therefore to find the capital, which in this country is found by the landlord, was placed under any difficulty in consequence and had to raise a mortgage?—A very common practice is to raise money by mortgage to provide the owner with means for equipping the farm, within the limits of the farm itself, and not necessarily to a very close margin; but it is very common.

40,253. (*Mr. Clay.*) How long is it since you were in America?—My last visit ended in October 1893; my former visit was from July to November 1884.

Major P. G. Craigie.
14 Feb. 1895.

Practice of agriculture in the United States.

40,254. Had you to make a survey and inquiry into the real practical work of the United States landlord and farmer combined?—My visits were much too short to make any thorough inquiry. I only saw what an ordinary traveller can see, and I went as far as possible into districts away from the railways so as to obtain some knowledge of the local life. But I will not say that the time, three months, or two months on the second occasion, was nearly sufficient to enable me to form a good opinion of the whole farming question; it was much too large a question.

40,255. You consider that a short visit like that would not be sufficient to give you real practical information about the ins-and-outs of the practice?—Certainly not. I I think information of that sort must come from a resident in the country. All that my visits have enabled me to do is to be able to read the figures which I received afterwards with a little more intelligence perhaps as to what they mean.

40,256. So you would not like to be very clear in your opinion about practical matters?—Certainly not.

40,257. You consider it requires a person to be there several years in order to be alongside and upside with the Yankee?—I think it is rather a difficult matter to understand anywhere, and most of all in a country of that magnitude and diversity of practice.

Agricultural statistics of the United States.

40,258. By your evidence I gather from you that you do not put full reliance upon many of the statistics that are given forth on American matters?—All I have to say is what I have said in the memorandum, namely, that there are certain discrepancies between the different series of figures, those by the Census authorities, those by the Department of Agriculture, and those by the different State Boards, which are a little difficult to reconcile, but probably accounted for by the enormous difficulties of collecting statistics in a country such as that. Therefore I have only ventured to found an opinion where I found the three sets of statistics were more or less in agreement.

40,259. Have you not found in America that these statistics, often for small States or large States, are got up by individuals for increased profit sharing?—I think there is always a tendency, where land has got to be sold, to represent things in as good a colour as possible, and that one must make allowance for that; but then I think there is another tendency to be borne in mind, namely, that in giving these figures to the State the individual agriculturist is influenced by the desire to put the figure low in order to avoid taxation. There are two currents of opinion; there is an influence to inflate the figures, which comes from the usual desire of the holder of land in America to sell his land; and there is also the current of opinion influencing him to understate in order to avoid the immediate taxation which might follow a statement to the State assessors.

40,260. Something of the same principle as in the Board of Trade, where you have bulling or bearing of an article up or down?—I rather gather that these two influences operate to induce a man either to understate or overstate his actual position. But there are also differences which are almost inseparable from statistics collected in a somewhat loose manner.

40,261. So that they are not at all times to be relied upon?—Not absolutely, but the general drift of the statistics for comparative purposes may be quite sufficient.

40,262. You made reference in page 4 to the great decrease in the State of Iowa?—I did. (Appendix XXII., par. 11.)

40,263. Which shows how cultivation will vary even in States in that country?—And vary with a much greater rapidity than we have any notion of here.

40,264. The State of Iowa seems to have five times less wheat in 1893 than in 1883?—That would be so.

40,265. Then below that in the same table, in the Dakotas (North and South) there is exactly another extraordinary change, namely, an increase of perhaps five to one?—In the opposite direction.

40,266. So I think that bears out what you would like to see, namely, that you should have a number of years' averages to enable you to form an opinion, and not a single year or two years' figures?—That is certainly so. I think nothing would be more fallacious than taking individual years. That is borne out by a table on page 7, which is taken from a return of the State of Illinois. I should like to call attention to the enormous changes between one year and another. According to these figures, if we may accept them, there were 2,700,000 acres under wheat in the year 1884, and only 1,068,000 in the next year; that is to say, as great a decrease as has taken place in many countries of the older world in 20 years. (Appendix XXII., par. 36.)

Major P. G. Craigie
14 Feb. 1895

40,267. So, at least, it is a very risky thing to take the figures for one year?—Yes. That is, perhaps, not owing to error, but owing, as probably the Commissioner knows, to the risky conditions of wheat cultivation in some of those States where insect damages, frost, and drought kill out the wheat over entire counties. So that the return of area at harvest is quite a different figure from what would have been returned at the beginning of the year.

Effect of price on the production of wheat.

40,268. Mr. Giffen, I think, intended to ask you this question, which I will do. Will the production of wheat not be largely increased by an increased price?—I think it would. I think if the price were sufficiently increased, a good deal of the land which formerly carried wheat might be put into wheat cultivation again.

40,269. But the low price of wheat has been driving both Iowa and some other States into oats and maize?—That is so—and grass.

Wheat-growing in Texas.

40,270. You cannot give us any further information than you have done regarding the powers of wheat growing in the Panhandle of Texas, which a witness has given us some very flourishing accounts of?—I have never been in the Panhandle of Texas. I have been in the southern part of Texas, but not in the north at all, nor in the north-west, in which the Panhandle is situated. The figures I gave were for the whole State of Texas. I have no figures which will enable me to show what has been the change in the Panhandle itself. I was not under the impression, until I heard it mentioned in this Commission, that the Panhandle was a wheat-growing district. That was not the impression I had gathered from conversation; but I had no figures as to this district.

Quality of American beef and mutton.

40,271. I think your impression is pretty nearly right. Do you think the quality of beef and mutton, especially beef, is as good as it was 10 years ago?—I am afraid that on my visit 10 years ago the impression I brought back was that I had never tasted any good mutton at all in the States. Beef has been good on both occasions, but the mutton I thought very poor indeed. That may be merely a matter of opinion; I state it for what it is worth.

Decline in number and quality of sheep in the United States.

40,272. Sheep are decreasing both in numbers and quality, are they not, in America?—I am inclined to think they are. But there is a qualification to that statement. In certain of the experimental stations in the States now—notably at Maddison in Wisconsin, I saw a number of experiments with breeding sheep from good imported animals which were producing very good results indeed and which seem to supply both as regards mutton and as regards wool very much better results than the native sheep had produced before.

Improvement of agriculture and cattle-rearing in the United States.

40,273. Do you not think there is ample room in America yet for improving the quality of beef and also the farming?—I think both, undoubtedly. There has been, as regards beef, a little check in recent years. It was going on improving up to a comparatively recent date, and I am not sure that this check altogether has not something to do with the cessation of some of the efforts that were being made to improve the breeds of cattle in America.

40,274. From what you saw there, you have no doubt that improvement in the fertility of the land and in the feeding of the cattle might be extended in America with judicious care?—Undoubtedly; there is great room yet for extension.

Depression in agriculture in the United States.

40,275. (*Mr. Gilmour.*) I think in answer to a general question of Mr. Long's, as to whether there was not depression in agriculture in America, you gave us a reason for thinking that perhaps there might not be any very general depression from the fact that new land was taken up and that people were still continuing to take land and farm it?—In some quarters of America, I think I said.

40,276. I suppose that in this county you admit there is agricultural depression?—There is certainly what we generally recognise by "agricultural depression."

40,277. In some quarters of it, you also admit that up to the present, at any rate, there has been no difficulty in letting land for agriculture?—That, perhaps, is more common in the north than in the south.

40,278. But still it exists in the country?—In certain parts of the country again, I should say.

40,279. Then continuing to farm in this country is very much on a par, in this case, with taking up new land in America?—I do not quite follow the Commissioner's question "on a par."

40,280. I mean that the taking up of new land for farming in America would in no way go to prove that

Major P. G. Craigie.
14 Feb. 1895.

agriculture was a good job any more than the re-taking of land here and continuing to farm it is an argument that agricultural depression does not exist to a very large extent here?—In both cases, what it would mean, would be that the individual, taking up the land, saw a possible chance of profit. We cannot carry a further inference than that—a possible chance of profit to the individual.

Cost of production of wheat in the United States.

40,281. (*Mr. Little.*) I should like to call your attention to the table relating to the State of Illinois, where the number of acres, the yield, and the value of the wheat crop are given; that seems to show that in the majority of years there has been a loss on the wheat crop?—In the case of wheat but not in the case of hay.

40,282. I was going just to draw your attention to the cost of production per acre, which seems to have remained almost stationary notwithstanding the enormous decrease in the value per acre. In the first five years it averages about 10½ dollars, and in the last five years it is just as much?—That is so; the figures, of course, are the estimate of the local state officers, and are quoted subject to some doubt as to their value.

40,283. At any rate it seems to show that the cost of production does not adjust itself to the value of the produce?—That would seem to be so.

40,284. At any rate for a long time?—I should also like to point out that in the special inquiry made only about a year ago by the United States Department of Agriculture where they employed 25,000 different farmers in different States to make a return of the cost of production, the average cost of production in the State of Illinois was given in the year 1893 as 11·45 cents; so it appeared to corroborate the table or rather to make it something higher—possibly because some item was included, such as rent of land or marketing which was not necessarily in the first table.

40,285. My point was that these estimates, take them for what they are worth, and I suppose they are as good for one year as another, show that the price of producing does not adjust itself to the value of the product, at any rate, for a considerable period?—That would be the impression I should take.

40,286. Practically the same result is shown with regard to the cost of production of oats, while the value of oats per acre has rather increased?—It has rather increased on the whole.

40,287. And the cost of production has not increased?—Assuming that the figures are correct.

40,288. I mean taking them for what they are worth?—I would point out that in several years it appears that no new estimate is made of the cost of production, but that the estimate of the previous years is simply repeated.

40,289. I have taken the first five years and the last five years of your table of wheat, and I find that in the first five years the estimated cost of production was 82 per cent. of the value of the whole crop, but that in the last five years of the series it was 99½ per cent. of the whole crop?—That would be about it.

Local taxation in the United States.

40,290. (*Mr. Dalton.*) I think you said that there are complaints in America that real property pays more than its fair share to local taxation?—I certainly heard those complaints, and this is borne out particularly in the report (which I believe is in the hands of the Commission) by a Sub-Committee of the Senate, which points out the particulars in which it objects to the over-taxation of real estate. That report is a report by the Chairman of the Sub-Committee of the Standing Committee on Agriculture and Forestry presented in the course of 1893, and it shows that among the grievances that are complained of, one of them is the over-assessment of real property.

40,291. Could you tell us what is the local taxation there?—It varies in every State, and in every county of every State.

40,292. On the whole is it higher or lower than in England, could you say?—I am afraid that is a question I could not answer off-hand, but my impression is that it certainly is lower.

Rating of personalty in the United States.

40,293. Could you give us any means of ascertaining what the present law of local taxation is in the different States?—Personalty and realty are both assessed, but the proportion of assessments placed upon real and personal property depends very much upon the character of the estate and the ability of the assessor.

40,294. How do they rate personalty?—On the capital value.

40,295. Is it rated in the same way that it was in England prior to the passing of the Act exempting stock-in-trade; must the personalty be situated in the locality, or how do you deal with it, where you have a man who owns a great deal of personalty, and who has property in many different districts?—I think the matter is full of difficulty, and I am not able to state with any precision what is the law on the point. The assessment is apparently local, and the difficulty will arise as to what is the locality of the personal property.

Major P. G. Craigie.
14 Feb. 1895.

40,296. You cannot tell us where we can get the information, can you? I ask because I have been trying to get it, and I cannot get it anywhere?—I have not the information before me at the present time, and I should not like to offer it in evidence without having it before me.

Rents in the United States.

40,297. Are the rents on the whole higher or lower there?—The figures as regards rent are perhaps best collected from that return of a few years ago to which I made allusion, when in every State an inquiry was made as to the proportion of the cost of growing wheat, and the rent of the land is given as one of the items.

40,298. Could you give us any estimate per acre?—The figures are given in dollars throughout. New England is 3½, for instance. These are the figures for the land growing wheat. What is meant by the term rent of land in this case has not been defined in the return; it may include possibly interest on the land where the land is mortgaged. It is rather an indefinite term, and they do not use it so strictly as we do; it may mean payment for the use of land.

Agricultural wages in the United States.

40,299. Are the agricultural wages higher or lower than in England?—The agricultural wages in America have been a subject of special inquiry. I have not embraced the results in my paper, but they are very fairly given in this report of the Department of Agriculture. In the paper giving results of nine inquiries from 1840 to 1865, and from 1866 up to 1892 the rate of wages is given by groups of States for agricultural labourers boarding themselves, and the figure varies very greatly in the different States, as you may imagine.

40,300. Can you tell us the maximum and the minimum?—I can give you the latest figures for 1892. In the Eastern States the wages without board per month, that is for labourers boarding themselves, are given as 26½ dollars, in the middle States as nearly 24, and in the southern States as nearly 15, the southern wages are very much lower.

40,301. But the others are about the same as England?—In the western States—and by the word "western" is not included a very large proportion of what we should call the west because they do not include the Mountain and the Pacific States which are to the west of the Western States. In the Western States, which include the great corn-growing basin and the central wheat basin, it is 22½ dollars a month, in the Mountain States it is as high as 32 dollars, and in the Pacific States it is 36 dollars. That quite corresponds with what I heard that he wages in California and the extreme west are probably the highest of the whole Union.

40,302. Then the agricultural wages in the corn-growing districts in America are considerably higher than they would be in England?—They are certainly higher but of course there are various modes of dispensing with labour which are practised in the United States, but which are not practised here, and the amount of labour that is saved is one of the things that strikes one in American agriculture.

40,303. Then speaking generally rents and rates are somewhat lower than in England, but wages are higher in the corn-growing districts of the United States?—I can name the wages in Pennsylvania, Ohio, Indiana, Illinois, and Nebraska. They give the wages there as running from 22 dollars, which I quoted before, to 26.

40,304. 22 dollars would be about 4*l.* 8*s.* a month?—That is without board. The local variations are mentioned. The Southern States are taken apart from the others, because their circumstances are so entirely different with coloured labour in the South that they should be taken separately.

40,305. (*Mr. Gilmour.*) Are the wages you have given for the whole year round?—Those figures are given as a mean for the year round, but as is very well known, very often the labourer is employed for only a month at a time and a great many are taken in at the time of reaping or the time of harvest.

40,306. So that it cannot be compared with the wages of our agricultural labourers?—They cannot be continuous wages during the year, because in many of those large wheat-growing States the labourers are taken on for a

Major P. G. Craigie.

few weeks for special work, at a special time, and then dismissed.

40,307. (*Mr. Dalton.*) Speaking generally, should you say that if you added together the wages, the rent, and the rates, the expenses are considerably lower in the United States in the corn-growing districts than they are in England?—By corn growing, do you mean maize only?

Cost of production of wheat in the United States.

40,308. No, wheat growing?—The expenses of growing wheat are probably, as far as these things can be estimated, better shown in this return to which I refer—the return of the cost of production; wherein the cost of production in growing wheat in those different American States is a subject of an analysis. These figures are from the 25,000 farmers, checked also by returns which were sent out to 4,000 experts connected with the agricultural colleges; I have seen both sets of figures, and they are published in detail for each State in these returns. Working them out in the New England States and converting them into English money, the cost of wheat growing is estimated to be something like 84*s.* per acre, taking the rent and the labour into account, marketing, and seed; in the Middle States about 75*s.*, in the Southern States about 45*s.*, and in the Western States, where the greater part is grown—the nominal Western States—somewhere about the same figure, about 45*s.* an acre. That is very much below the figure at which wheat is assumed to be grown in this country. The estimates that I have seen given, although they are all very doubtful and very problematical matters, have never been anywhere nearly as low as that figure.

40,309. (*Mr. Little.*) That is wheat grown continuously on new land, is it not?—Not always on new land, because if you take the New England States and certain of the Midland States——

40,310. I mean in the extreme Western States where the cost is put at 45*s.*?—These names are very misleading. The nominal Western States are not Western States in the sense of being new States. The Western States consist of, according to this return, West Virginia, Kentucky, Ohio, Michigan, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, Nebraska, and the two Dakotas; but taking Dakota by itself, which is probably the best test—it is a purely wheat-growing State—where wheat-growing has increased, the minimum figure quoted for South Dakota, I may say, is 35*s.* 8*d.* per acre.
